A. It is necessary to shut down at least every 24 hours and frequently it is the best practice to shut down twice, depending largely on the kind of fuel you are using.

Q. What is the purpose of this shut down each day?

A. To restore the fuel to a good workable condition so gas can be made economically.

COURT: What is the fuel that is used here?

A. Coke at this time. It has to be either coke or anthracite coal and anthracite is too expensive.

Q. Pursuing this digression a little further what kind of fuel is used in the boilers?

A. Steam coal.

Q. That is a local coal?

A. Yes, that is a low grade bituminous coal.

Q. In addition to this shutting down on-e or twice a day to clean the fires that you have referred to what if any necessity is there for shutting down periodically?

A. It becomes necessary to shut down every water gas plant at intervals ranging from sixty to ninety days for periods of five to nine or ten days for the purpose of cooling off the carburetor and super heater, taking out the checker brick with which they are
1042 partially filled and replacing this checker brick with other clean brick. The oil injected into the carburetor with which they are supplied fill the pores of the fire brick with carbon and carbon is a very low heat conveyor and heat won't go into the brick fast enough to meet the demands when the pores are filled with carbon and the brick has to be replaced on that account. It is very important that the brick heat up and give out the heat quickly. Brick is the only thing that will stand the strain and still come within out reach.

Q. What do you mean by come within reach, fin--cially?

A. Commercially, yes.

COURT: What is it the bricks absorb?

A. Carbon. It is supplied by oil to the fire making hydrogen gas and lamp black or carbon and that carbon gets into the pores of the brick and causes it to become so heat cannot get into the brick rapidly nor get out rapidly. The function of the brick is to absorb heat and release it as quickly as possible.

Q. Is it more economic to have a surplus generator capacity or surplus holder capacity?

A. Well the particular plant of course would have to be considered in answering a thing of that sort.

Q. Take this plant?

A. If you were to take this plant and were to provide with the present generator capacity enough holder capacity to carry you over such times as you might expect to have to tide over and if on the other hand you could put in water gas generating capacity to tide you over that same time, requiring no additional investment in the balance of the plant the installation of generating capacity
1043 would be very much cheaper than the installation of the holder capacity——

COURT: I think you gave the proportions of the gas, but I have forgotten.

A. The proportion of the gas leaving the generator you mean. There are about equal volumes of carbonmonoxide and hydrogen at that point, they are about five per cent each of the total volume of gas leaving the generator. An amount -qual to that of carbon monoxide and hydrogen is added in the carbureter from the oil so the finished product has about one third of its total volume made up with gases from the oil. These proportions of course will vary with the conditions of local operation always.

Q. I wish you would state what if any additional investment will be necessary in the near future if the company is to maintain the efficiency of its service here in Des Moines. State generally or in detail as you prefer.

A. Well in connection with my giving the full calculations I have gone very carefully into the probable increase in gas sales in this city and I estimate that during the next seven years there will be required approximately 40 per cent more gas than is now that is there will be sold approximately forty per cent more gas per day than is now being sold. This plant now has a reserve capacity which is so small that within two years it will be necessary to make additions and at that time it would not be good business to make a small-addition than two million cubic feet per day in capacity at the works. The reserve capacity required in a water gas plant will decrease in percentage of the total capacity as the plant increases in size. In other words, this two million feet water gas set which may now be considered reserve of a plant of three million capacity is also ample as reserve for a plant of five million safe working capacity.
1044 So to give this plant an additional capacity of two million feet per day it would be necessary to add only the two million feet. But you would have to add it in the water gas generating plant and in the condenser and in the scrubbers and in the exhausters and in the purifiers and in the buildings proportionately and possibly some additional real estate will be required for that portion of the plant and you would need in addition I should say about three years from now, within three years additional holder capacity and that holder capacity should be certainly a minimum of two million cubic feet. Then for an increase of forty per cent in sales I would judge that you would have to increase the investment

in mains by twenty per cent over the present reproduction cost. To take care of forty per cent increase in sales you would also have an increase of services and the number of meters by approximately forty per cent of what they are now. The total of all of these extensions would approximate something over one million dollars. And some of this money would have to begin going into the property I should say certainly within eighteen months some of it and be spread over a period of perhaps over four or five years.

Q. Can you tell us what must be the per cent of condition of a plant in order to permit it to render efficient service?

A. Well that will again vary with the different parts of the plant. A scrubber for instance might be almost ready to go out of commission and still be capable of holding the trays and retaining the gas as effectively as a new scrubber. But that would not be true of the water gas plant or would not be true of the holders because there would be such an element of danger involved there you would be compelled to take them down. I should say that a plant having as a whole, that is the works themselves having as a whole a per
1045 cent condition below seventy was getting into the dangerous region and I would not — to operate it. On the other hand you might go too far and spend money unnecessarily in maintenance. For instance it is not at all necessary to have the present value of the plant 95 per cent say. If you were to keep all your plant up to 95 per cent you would be wasting money. Between these two points is the per cent condition in the average plant which will yield the greatest net return without taking any chances with the interests of the community or of the company.

Q. You are familiar with the location of the real estate used by this *property* in connection with its manufacturing plant.

A. Yes, sir.

Q. I wish you would state what if any factors there are which render the location of this real estate especially adapted to the uses of this company manufacturing and distributing gas.

A. I would say that this is one of the very best if not the very best locations within the city of Des Moines for a gas plant. I say that in view of the effect which other locations would have upon the cost of manufacture or distribution or both and of such other items as complications arising from being too near to the center of the city. The location of this property is very advantageous from a transportation standpoint. It is advantageous with respect to the river which affords convenient drainage facilities. It is as close to the center of distribution as you can go and still remain on low ground with trackage facilities without being in constant danger of suits because of nuisance.

Q. What do you mean by that?

A. A gas plant located in the midst of the best residential district is always subject to complaint and frequently to legal action because of the smells coming from a gas plant. The plant is located on ground which is lower than the major portion of the district
1046 to be supplied and that is an advantage because it reduces the necessary investment in street mains due to the fact gas is lighter than air. It is also advantageous in view of the fact

that it is not surrounded by industries or residences or mercantile places that would be seriously affected by proximity to a gas plant.

Q. You speak of trackage facilities. What materials that the company uses come in by the carload?

A. Coal, coke, oil, pipe, all the fixtures and appliances, gas consuming appliances, all of the gas making material and practically all the material which the company uses in extending and developing its business come in by rail in carload lots. And the tar which the company ships away is handled the same way.

Mr. GUERNSEY: We offer in evidence Exhibit 20 in connection with Mr. Lea's testimony concerning it.

Mr. BYERS: Exhibit 20 is objected to as incompetent, immaterial not rel/evant to any issue that is involved in this controversy. We make the further objection to all of that part of Exhibit 20 which has to do with the so-called hypothetical plant and the item of going value and all the other items involved in the schedules and tables going to make up this socalled hypothetical plant and going value as entirely irr-levant to any issue in this case, incompetent and immaterial. We make the further objection to all that part of Exhibit 20 which refers to the going plant for the reason that it appears from the testimony of the witness by whom the exhibit is sought to be identified and qualified that the schedules and tables of figures and all the figures contained in that part of Exhibit 20 are mere estimates and nine of them purport to be the facts and figures as shown by the records and books of the company which it appears
1047 from the witness' testimony was in a measure used as a basis for his computations and schedules and tables of figures. We make the further objection to that part of Exhibit 20 in which the computation and tables and schedules of the so called going plant are set out that it appears from the testimony of the witness that the exa/t figures as to all of the problems involved in this part of Exhibit 20 as to the questions of cost and the questions of lineal feet and size of pipe and all other important items entering into the valuation of the property of this complainant is found and can be found in the books and records of the company and were within reach of the witness and are now in reach of this court and for that reason the estimate of the witness is incompetent and immaterial and irrelevant and for this and the reasons heretofore stated in the other objections, the defendant objects to any testimony being received upon the theory of replacement or reproduction. Defendant objects to all that part of Exhibit 20 and to all testimony given by the witness, Mr. Lea, with respect to mains under paving for the reason that the same is incompetent, immaterial, irrelevant, not the best evidence and it already appearing from the testimony of the witness that wh-ever facts are necessary to ascertain the value of this complainant's property with respect to mains and pavements are matters of record in the books of the company. For the further purposes of the record I would like to have the record show the same objections made to the matter in Exhibit 20 as are covered by the preceding objections shall stand as to the items of estimated value given by the witness Lea, in Exhibit 20 and also as to the testimony

as to crossings under railroad tracks and street railway tracks for the same reasons.

1048 Cross-examination by Hon H. W. Byers:

Q. You started your examination several days ago with the suggestion, Mr. Lea, or statement rather, that you were 33 years old and a consulting engineer. Where is your present residence?

A. Chicago.

Q. And your business, Chicago?

A. Consulting Gas Engineer.

Q. I mean you have your headquarters in Chicago, your business headquarters.

A. My office you mean, location of my office?

Q. Yes.

A. In Chicago, corner Adams and Michigan Boulevard.

Q. Is that the People's Gas Building?

A. That is the name of the building.

Q. How long have you been in that building?

A. Since the building was ready for occupancy, about a year and a half ago I judge.

Q. And you have been more or less interested in the gas business since 1896 I believe you said?

A. Yes, sir; continuously.

Q. Always as an employé?

A. No, sir.

Q. Part of the time as owner or interested in the business yourself in a financial way?

A. Well not interested in the ownership to any extend, but I was thinking of salaried positions. I have not been on a salary for nearly five years.

Q. I used the term employé in a general sense.

A. Oh yes, always been working for somebody on some basis.

1049 Q. Never operated a gas plant yourself?

A. Yes, I have done that.

Q. As the owner?

A. As the part owner.

Q. Where was that and when?

A. That was in a town of about 7000 people in Illinois.

Q. How long ago?

A. Well I got the plant about two and one half years ago.

Q. Do you have it now?

A. Yes, sir.

Q. You are operating it right now?

A. Yes, sir.

Q. What kind of a gas plant is it?

A. Coal gas.

Q. What do you say the population of the city is?

A. About 7000 I understand.

Q. What town is it?

A. Duquoin.

Q. How far is that from Chicago?
A. About 280 miles.
Q. South?
A. Yes, sir.
Q. How far from east St. Louis?
A. I would judge about 65 or 70 miles.
Q. Is anybody else interested with you in that gas plant?
A. Yes, sir.
Q. Who?

Mr. GUERNSEY: I don't know of there is any objection to disclosing this, but I think it is not cross examination and wholly immaterial. I don't know whether Mr. Lea has any business rea-
1050 sons for not wishing to disclose it or not.

Mr. BYERS: Perhaps he better suggest it if he has.

A. There is not the slightest objection in the world to telling who is associated with me if it is of any importance in the case. The people are not in the gas business at all aside from this one venture. If there is any importance or any reason why the name should be given, but I don't see that it is of any importance.

Q. Of course you may not see that but it may be possible when you don't see it, that when we know we won't see it, but now we don't know it.

A. There is no other owner of any part of this Duquoin Gas Co., who is in any way connected with any other gas company as owner as part owner or officer or employé.

Q. That is a very proper statement, but if you will just tell us who it is.

Objected to as not proper cross examination, irrelevant and immaterial.

A. Frank M. Elliott, real estate dealer of Chicago, Frederick W. Harnwell, a corporation counsel, in the city of Chicago.

Q. Anybody else?
A. That is all.
Q. Now have you any interest in any other gas property or gas plant anywhere?
A. No, sir.
Q. Have you had?
A. No, sir.
Q. Ever operate any other plant but this one?
A. I have operated other plants but not as owner or part owner.
Q. I mean as owner?
1051 A. No, sir.
Q. What did you say was the population of the city where this plant is located?
A. I have never seen the census figures. I am told it is 7000 and it looks about 7000 to me.
Q. What is the gas rate there per thousand feet?
A. I don't remember.
Q. Don't you know what you get?

A. I know how to find out what I am getting, but I don't remember.

Q. How long have you owned the plant?

A. About two and a half years.

Q. Are these other men gas experts?

A. They have never had any experience before or been in any way connected with gas. They have no connection now with the plant except one is called vice president and one called secretary and the secretary's bookkeeper writes out the vouchers, that is the only connection they have.

Q. What is your title?

A. President.

Q. Manager?

A. No. A local man is manager.

Q. A local man operates the plant?

A. Yes, sir.

Q. To whom does he report.

A. To me.

Q. Don't you know at this moment what price you are selling your gas for there?

A. I do not.

Q. What were you selling it for there last year?

A. I believe it was 1.50, but I am not sure of that.

1052 Q. And the year before?

A. I don't remember.

Q. Do you know what you were selling it for the first of this year?

A. No, sir.

Q. Say the first of January 1911?

A. No, sir.

Q. You don't know what you are selling it at now?

A. No, sir.

Q. From whom did you buy the plant?

A. From the then owners, but I have forgotten their names.

Q. Were they local people in that little city?

A. Yes, sir.

Q. Who did you buy your material, your supplies and material for extensions of?

A. We don't buy it from any one person.

Q. From whom do you buy the larger part of it?

A. If you will specify the material I will try to tell you.

Q. Such as your mains and service pipes and that class of goods?

A. We haven't bought any mains, if we had we would have bought them probably from the U. S. Cast Iron Pipe & Foundry Company.

Q. Where are they?

A. Chicago, one office. I say probably, that is just because they are usually able to name better prices in the vicinity of Chicago than the other pipe people.

Q. Have you bought any new apparatus since you have had it?

A. Mone complete apparatus, we have had some refilling of benches done.

Q. What is the apparatus that is used in the plant, that is whose make is it, give us the name of some of the important parts of the apparatus.

1053 A. The benches were originally built I think by the Laclede-Christy people. I believe they built the first two benches and I believe the Walker-Russell Main manufacturing Company built the third bench. And the refilling which I have just named was done by the Gas United Construction Company of St. Louis.

Q. When did you first become part owner of that plant?

A. About two and a half years ago.

Q. That would be some time in 1908?

A. I believe that is correct yes.

Q. And you have owned as interest in it ever since.

A. Yes, sir.

Q. You began by saying other things you opened your office in Chicago in 1907.

A. Yes, sir.

Q. Now was it, to fix this time of purchase of this plant, a little more definitely, how long was it after you opened your office in Chicago?

A. I don't remember, it was in the neighborhood of two years.

Q. After you located?

A. In the neighborhood of two years, yes.

Q. So it would be perhaps safer to say some time in 1909 then that you became interested in the gas plant.

A. I can get the record if necessary.

Q. It is not so important but I want to get your best judgment about it.

A. It is between two and two and one half years as I remember it since I got the plant.

Q. What was the Daws syndicate you referred to?

A. That is a group of men represented usually by one or more of the Daws Bros. of Chicago.

Q. Is this Charles Daws the man who was formerly at

1054 Lincoln, Nebraska is that one?

A. He is one of the brothers.

Q. What is the practical business of the syndicate?

A. I don't know except in a general way that they operate gas and electric properties.

Q. Throughout Illinois?

A. I don't know where they are now I have not been with them for several years, know nothing about their business.

Q. Were you ever employed by them?

A. Yes, sir.

Q. When?

A. At five or six different places.

Q. When?

A. I don't remember the years. You will find the name of the cities in the record.

Q. I think you said there were two cities that you had made an inventory or was interested in either making an inventory or—one was Buffalo and the other Beatrice, Nebraska.

A. That question referred to work which I done for municipalities recently and those are the only two municipal jobs I have had recently.

Q. How recently were they?

A. Within the past year, past six months you might say, within the past six months I believe both of them.

Q. Were you employed by the Daws Syndicate in 1907 at the time you opened your office in Chicago?

A. No, sir.

Q. Have you been since?

A. No. sir.

1055 Q. Then your employment with that syndicate was all prior to 1907?

A. Oh yes, a long time prior.

Q. You spoke about your having some employment by a committee in Chicago under which you worked or made a partial estimate of the value of the Chicago Gas plant, I have forgotten the name of it.

A. No, I didn't refer to any committee, I said by interests antagonistic to the company.

Q. What do you mean by that?

A. Just that. Interests antagonistic to the gas company.

Q. You mean the community, interests in the community there, or do you mean some gas manufacturing Company?

A. This interest was in the community, yes.

Q. Was it a gas concern?

A. No.

Q. Wasn't the city of Chicago?

A. It was not.

Q. When was that employment, when did it begin?

A. About the first of last year as I remember it.

Q. About the first of January 1910?

A. I believe that is right.

Q. What was the character of that employment, what were you employed to do?

A. Make a complete valuation of all gas property in the city of Chicago used and useful in the manufacture and distribution of gas in Chicago.

Q. Now if you have no objection I wish you would tell us a little more definitely who your employers were?

A. I would like to know whether it is important that I answer these things. This work comes to me in a confidential way. People do not employ consulting engineers to handle work and expect

them to announce that around what they are doing and who
1056 they are working for and all that and if it is not necessary I don't want to answer this. I have objections to answering.

Q. You don't wish to state who your employment was by?

A. I do not wish to violate the understanding or agreement under which the work was given to me. It was not supposed that I would make public matters of that sort when the work was turned over to me.

Q. Of course you understand Mr. Lea I am not asking you for the details of your employment at all or for the result of your investigation, I am simply asking you now is you are not willing to give us the names?

A. I am not.

Q. The name of the individual or corporation or interest that employed you?

A. No, sir; I am not.

Q. How did it come that you did not complete your work for that interest?

A. Two of the men in the board of directors of the company by whom I was engaged to do this work died within a period of thirty days of each other and it happened that these two men between them had controlled the policy of this concern. On the death of the second of these two men the next strongest man came into the control and his policy was directly antagonistic to that of these two men who had died and he was not in favor of continuing this work and it was at that time stopped.

Q. Now up to that time in pursuing your employment had you spent some time in the offices and about the plant of the Chicago Gas Co., that you were investigating?

A. Oh several years before that.

1057 Q. No, as part of that employment. I am referring now to the employment of this company two members of which you say died. I understood in your examination in chief you said that you got about half through with making this valuation of that gas property when your employment ceased. Now this question goes to that employment and not any former employment?

A. While I was making that examination I had naturally to go to the properties of the company and I had completed my examination of several of the plants in Chicago at that time.

Q. And had you gone through any part of the books and accounts of the company?

A. No, sir.

Q. Had you spent any time in the office of the company?

A. No, sir.

Q. Your work then up to that point had been confined to the physical property, that is the plant and the mains and services, etc.?

A. Had been confined exclusively to the plants. There were several plants in Chicago, several manufacturing stations in Chicago.

Q. Of course I am confining myself or trying to to the concern that you were examining ?

A. Well I had examined several of the gas plants in Chicago for that concern before the work was stopped and had reported to them on the plants.

Q. That is several plants owned by the gas company?

A. By plant I mean in this sense, manufacturing stations owned by the people Gaslight & Coke Co. in the City of Chicago.

Q. In doing that had you access to any records or books of that concern?

A. No, sir; I did not try to get any access to records or books.

Q. When you got about half through you then completed the work for gas company.

1058 A. After an interval of time.

Q. How long?

A. Perhaps thirty days, forty days.

Q. Just about when was your employment by the gas company, give us the date as near as you can?

A. I don't remember the date. Perhaps about the middle of last year.

Q. About the middle of 1910?

A. I should judge so.

Q. And when did your work cease?

A. When I finished the job along in the fall some time.

Q. How long before you came here?

A. Oh sixty or ninety days may be.

Q. That then would be some time in October?

A. I don't remember the date. I would have to look it up.

Q. You remember when you came here.

A. It may have been only thirty days.

—. ——.

A. Yes I gave that the other day the first part of January, January 13th I came here.

Q. You did have access to the plants did you?

A. Yes, sir.

Q. And spent considerable time in making up your report?

A. Naturally I had to examine the equipment and buildings myself.

Q. Referring now to the time when you were working for these hostile interests?

A. The same thing applies, I was doing exactly the kind of work for them on exactly the same basis when I finished later for the company.

Q. So you did have access to the plant while making the

1059 fore part of your report?

A. Certainly yes.

Q. And that work was going on as late as October was it?

A. I won't say that, I don't remember. I would have to look it up.

Q. When were you first interviewed with respect to the Des Moines situation?

A. 12th of January of this year.

Q. Was that the first time anything was said to you about it?
A. Yes, sir.
Q. And where was that interview?
A. It was in Chicago and in Des Moines. Mr. Haines was in Des Moines and I was in Chicago.
Q. It was over the telephone?
A. Yes, sir.
Q. Or by correspondence or how?
A. Telephone.
Q. That was the 12th of January?
A. As I remember it.
Q. At that time your work in making the inventory and valuation of the Chicago property had been completed as I understand it?
A. Yes, sir.
Q. So that you had no further employment at that time for the Chicago concern?
A. Not for the Chicago concern.
Q. What other employment do you have or did you have in the way of making valuations or invo-ces on gas properties at the time Mr. Haines first spoke to you?
A. Only valuations you mean?
Q. Valuations or any other information that you were to
1060 give about the cost of gas plants?
A. I had pending at that time the designing of a gas plant for Coshocton, Ohio, the designing for a gas plant for Brazil, Indiana, and there was still some loose ends on the appraisal at Freeport, Illinois. I think that is all I had on at that time.
Q. This appraisal at Freeport, who was that being made for?
A. The company.
Q. What company?
A. The Freeport Gas Light & Coke Co.
Q. Is that a local concern in Freeport?
A. Yes, sir.
Q. No connection with the Chicago plant.
A. Not the slightest or with any other gas company that I know of anywhere.
Q. You made an investigation and you know I suppose as a matter of fact from the examination of their books?
A. I never examined the stock certificates, I don't know who owns the stock but I was told locally that it was held locally. I don't examine the stock certificate record or bond holders in order to determine the value of property.
Q. You don't care anything about that in order to get at value.
A. Not the slightest thing in the world, no sir.
Q. Who were those other examinations being made for
A. The Coshocton was for the firm of James B. Clough & Sons, cast iron pipe manufacturers in Chicago.
Q. No gas concern at all?
A. No, sir. The Linton was being done for a consulting electrical engineer in Chicago who was not familiar with gas prices, he had

not had any experience in it and didn't want to take the
1061 responsibility so I handled the gas part of the work for him.

Q. The gas property at Freeport, was your investigation and examination there made with a view of being a witness in some controversy?

A. No, sir. There was no argument of any kind on at Freeport. The company had been running along for a very great many years with its original capitalization or at least capitalization was many years previous, the city had grown and the business grown to a point where the company wanted to reorganize and my report was made exclusively for the purpose of providing the owners of the company with a correct basis of reorganization as between themselves, not as between themselves and the city or any other opposition. There was no opposition about it.

Q. Is this the first time that you ever made an investigation of a gas plant for the purpose of making an estimate of value as a witness?

A. No, sir.

Q. In what other case do you remember now?

A. Well are you asking whether I appeared as a witness or whether the work was performed with that possibility?

Q. With a view of being a witness.

A. This is not the only one, no.

Q. When was the last case just prior to this present one?

A. The last one prior to this was Taylorville, Illinois.

Q. How large a place is that?

A. I don't remember. I think it is about 12000.

Q. And how long ago?

A. Oh four or five months, this year some time.

Q. By whom were you employed in that case?

A. By the ocmpany.

1062 Q. What is that company?

A. I believe the title is Taylorville Gas—I don't remember the exact title, the only gas company in Taylorville, Illinois.

Q. And is it a local company, the people who own it live there in Taylorville?

A. I don't know where the ownerhsip rests.

Q. You don't know what relation it has if any to the Chicago Company?

A. I have not the slightest reason to think there is any connection between them and the Chicago Company.

Q. Or the United Gas Improvement Company?

A. No, sir. Because the only interests I know of as being concerned there are interests antagonistic to both interests in Chicago and the United Gas Improvement crowd.

Q. Was that in a rate contro-ersy?

A. Yes, sir.

Q. Anywhere else just recently?

A. Well Beatrice, Nebraska was within the last, well say in this year.

Q. Was that a rate controversy?

A. Yes, sir.

Q. You appeared there as I understand it for the city?
A. For the city, yes.
Q. Beatrice is a town of about 15,000 people?
A. About that.
Q. More than one gas plant there?
A. No, sir.
Q. Do you know what that company is there?
A. What the nature of the gas is?
Q. No the company itself, is it a local concern?
1063 A. No, it is not a local concern. A man whose name I have forgotten, but who I remember is pastor of John D. Rockefeller's church in Cleveland is the principal owner. I think it is Eaton, is the principal owner and they have one or two other plants, one of which is in Canada.
Q. One in Canada?
A. Yes, sir.
Q. Now Mr. Lea, how long after you received your telephone communication was it before you came to Des Moines?
A. About ten hours.
Q. And when had you been in Des Moines just prior to that?
A. Severa- years, I have forgotten just when. The last time was at some gas convention here.
Q. Can you give us somewhere near the time?
A. Four, five, six or seven years ago, I don't know, I don't remember. I should say thought not less than four years nor more than seven.
Q. Had you ever lived in Des Moines?
A. No, sir.
Q. I think you said you were at Ottumwa awhile?
A. Yes, sir.
Q. How long?
A. Some few months, until my work there was done, I have forgotten just how many.
Q. Was that the only residence you ever had in the state?
A. Well I didn't claim it was my residence then.
Q. Anywhere else?
A. I was at Keokuk for a short while.
Q. Managing a property for somebody else?
1064 A. No not managing, my work was making changes in the plant so the plant could make coal gas or water gas or both.
Q. You were there as engineer?
A. Yes, sir.
Q. Is that also true of Ottumwa?
A. Yes, sir.
Q. While you were at Ottumwa were you in Des Moines?
A. I don't remember where I came from to attend this gas convention. I would have to learn the year and I don't remember what that was.
Q. If you were here it was just to attend that gas convention?

A. That is all. Just gave a cursory look over the plant while attending the convention.

Q. Then you came here the 13th of January was it?

A. Yes, sir.

Q. Then I suppose you had a personal interview with Mr. Haines?

A. Yes, sir.

Q. And what did he say to you about what he desired to have you do?

A. He told me that there was some question between the city and the company as to the price of gas and that he would like to have me make an appraisal of all of the property of the company used and useful in the manufacture and distribution of gas within the city of Des Moines as it was at that time or as it was on the 1st day of that month.

Q. Did he make a contract with you?

A. Nothing beyond a verbal contract.

Q. I am not asking for the terms but you made a contract did you of some kind?

A. Made a contract in the sense he told me what he wanted me to do and I said all right I will go ahead.

Q. Who did you understand was employing you to do the work?

1065 A. The Des Moines Gas Company.

Q. And are you in their employ now?

A. In the sense that I am being paid for my time here.

Q. Your employment has continued along until this time?

A. No, sir. I am in their employment when I am on their work. If I go on somebody else's work tomorrow and back here next day I am not on their pay in the meantime. I am on my own or some one else's time in the meantime.

Q. I suppose your employment then is perhaps by the day?

A. Yes, sir.

Q. Did Mr. Haines tell you at that time what the controversy was?

A. I don't remember that he did. I don't remember that he did not. I know it was not very long before I understood about where the case stood, but I don't remember exactly what he told me.

Q. He told you didn't he at that time that the controversy was over the charge for gas, that he was selling gas at $1.00 and $1.10 and the city had passed an ordinance reducing the rate to 90 cents, that is the way you understood it?

A. I understood that was what had happened or was about to happen. I don't remember now it was one or the other.

Q. Mr. Haines told you I suppose that he wanted you to place a valuation upon the gas company's property on the theory or at least on his claim that the valuation of the property and the cost of making gas here would not justify making the 90 cent rate.

A. He certainly did not.

Q. Well what did he say about that?

A. He didn't have anything to say about that, he could not have said it to me if he had.

Q. Did he say that the rate fixed by the ordinance was too low, they were not going to yield to it?

1066 A. He didn't say anything to me about the ordinance being too low.

Q. What did he say about it in explaining to you how the controversy arose.

A. I don't remember that he did explain how the controversy arose. I remember very shortly after I got here that the controversy was over a proposed or actual 90 cent ordinance and that the existing price was $1.00 net and I was asked to make an appraisal of the property of the company.

Q. What do you mean by $1.00 net?

A. That is the price of gas after the discount for prompt payment has been deducted.

Q. That is the company got $1.10 if the payment was not made within a certain time after the first of the month?

A. Yes, sir.

Q. And if it was made it would be but a dollar. Now what else did he say.

A. I don't remember anything he said beyond the statement that he would like to have me make a valuation of this property.

Q. Did he tell you what property?

A. Property of the Des Moines Gas Company.

Q. How long after that before you were furnished with the books and records and papers of the concern if you were ever furnished?

A. I was furnished with some material that same day, but I don't remember now just what it was and how much of it.

Q. Now in making up your valuation did you proceed wholly on your own theory or upon the theory suggested by anybody else?

A. I proceeded upon what I considered as the only theory that anybody can consistently proceed on that is formulated there as the only valuation to be reached.

(Question read.)

1067 A. May I ask now you mean theory as to the basis on which the value is to be made?

Q. The manner in which you made it and theory on which you based it.

A. You mean to say I commenced in my valuation by opinions or suggestions of other people, is that what you mean?

Q. No, what I mean Mr. Lea, did you proceed to ascertain first the physical items of this property and then proceed to put a valuation upon it upon your own theory or upon some theory suggested by somebody else?

A. I used no theories obtained from other people in the sense you are speaking of except that I have not evolved any theories out of my own consciousness as to the basis on which the appraisal should be made. I have followed what is recognized as good practice.

Q. After you had accepted your employment I wish you would tell the Master just what was the first thing you did to begin your work?

A. Went to the plant and looked around.

Q. Anything else?

A. Came back and got some details as to equipment and went back to the plant.

Q. What details?

A. I don't remember.

Q. In a general way.

A. Went over portions of what now constitutes the inventory. They were not at that time finished up as I remember it.

Q. You say the inventory was not finished at that time?

A. As I remember it. I may be wrong on that. I know I did not get a complete inventory at that time on my arrival.

Q. After you got through with your looking over the plant as you say you did, what was the next thing you say you did in the way of getting a basis for your valuation?

1068 A. The checking of the items in a portion of the inventory which I had to satisfy myself as to the substantial accuracy of the inventory.

Q. Checking it with what?

A. With the items themselves.

Q. The items themselves?

A. I had gone over the physical property, the plant and tools and apparatus.

Q. What next did you do in the way of ascertaining the necessary information upon which to base your value?

A. Well after I had obtained the balance of the inventory showing the distribution system and balance of the works equipment, I drove over all parts of the city to see if the indications I could locate of gas supply would agree with the extremities of the main system shown on the map.

Q. Who gave you the information upon which you could make your trip about the city, where did you get that?

A. The map itself you mean?

Q. Yes, you might have got it from the map, but who was with you to help you to locate these mains and services and all that sort of thing?

A. Well part of the time I was alone and part of the time Mr. Vinvent was with me.

Mr. GUERNSEY: Who is Mr. Vinvent?

A. Engineer of the gas company, he saved me some time showing me short cuts to the districts I wanted to see.

Q. What did you do next?

A. After satisfying myself that the works equipment, buildings, real estate and distribution system were as indicated in the inventory I set about learning the local factors as to prices of labor and

1069 raw materials entering into construction.

Q. How did you do that?

A. By asking questions.

Q. Yes, I know, and I want to treat you right Mr. Lea, and I hope you *you* will meet me half way on it. Now what I want to know from you about that is just where did you go to get your

information and who directed you to the places you went, who did you see?

A. Nobody directed me to most of the people I asked. I have some figures that were obtained before I came.

Q. Where did you get these figures?

A. These figures I got from the gas company.

Q. Here in Des Moines?

A. They obtained them from the contractors in the city, some of the contractors.

Q. And furnished them to you?

A. Yes. That is not saying those were the figures I used. I admit having received them from the company, but I did not use them as I received them.

Q. I wish you would state in the shortest possible way that it can be fully stated just what you *have* in your mind now after you had accepted this employment it was necessary upon which to fix a valuation of this property, just the items you had in your mind necessary to be ascertained?

A. I had in my mind one thing and that was the determination of that value upon the physical equipment of the property with allowance for working capital and preliminary organization expense and for going value which could be substantiated by the facts in any court and nothing else.

Q. You cared nothing about investment?

A. Nothing.

1070 Q. Cared nothing about original cost?

A. No, sir.

Q. You paid no attention to either of these items?

A. Except in a very indirect way I did not use them.

Q. You cared nothing about capital?

A. No, sir.

Q. You cared nothing about construction cost as it appeared in the books?

A. No, sir.

Q. You made no effort to ascertain any of these facts?

A. No, sir.

Q. And you proceeded entirely upon the theory it was absolutely immaterial as to what any of this property here cost or how much money had been invested in it or what operating expenses may have been?

A. I never said that.

Q. Which item do you cut out?

A. I don't say it is absolutely immaterial as to what these did cost nor as to what labor or other operating charges may have been, I said nothing of that sort. I said only this, I never considered the actual cost of any of the items as shown by the books of the company. In arriving at the present value of the property because I don't know that these records cover the actual present value, but I do know how to arrive at the present value by my own methods.

Q. You made no effort then did you to ascertain what the property cost the company to begin with did you?

A. I was not asked to determine what it cost.
Q. (Question read.)
A. No, sir.
1071 Q. You made no effort to ascertain what the present owners of this property actually invested in it did you?
A. No, sir.
Q. You made no effort to ascertain from the books of the company just what the labor cost that was involved in the plant at the time you began to investigate it did you?
A. No, sir.
Q. In other words, you paid no attention so far as fixing the value is concerned to any fact that could be ascertained from the books of the company except to check up the physical items of the prop'— is that right?
A. That is so, but it is so because I considered it——
Q. I am not asking why it is so, simply asking for the facts?

Mr. GUERNSEY: I think the witness has a right to add the explanation.
COURT: Well it is now adjourning time.
Here the further hearing was adjourned until 9:30 A. M. tomorrow.

1072 Thursday Forenoon Session.

JULY 27, 1911, at 9:30 a. m.

Counsel for the respective parties all present.
Testimony on part of complainant resumed as follows:

HENRY I. LEA, Re-called for further cross examination, examined by Gen. H. W. Byers, testified as follows:
Q. Mr. Lea, I want to clear up one matter I thought about after we adjourned last night. I think you misunderstood one of my questions. Early in the cross examination you were asked, when you came here after a telephone communication, about what Mr. Haines said to you about the character of the controversy that was on, and the purpose of an inventory or a valuation of their property, and you were asked, as I remember it, what Mr. Haines said to you about the valuation of the property as to their wanting the property valued for the purpose of sustaining their position as to rates. Evidently from your answer, as I read it over, you got the impression from that question that I meant to inquire of you if Mr. Haines did not tell you just the kind of valuation he wanted made?
A. I thought that was what you were driving at.
Q. That was not it at all, what I was driving at. I don't want you to think that I would suggest that about Mr. Haines, and I do not want it to appear that way in the record. All I was trying to get at was just what information you had about this controversy when you made up your mind as to what method you would pursue in making the valuation, and what theory you would adopt in arriving at your valuation. Now, another thing I want to ask you a little

further about—did I understand you to say that you had
1073 made or placed a valuation on the gas plant at Beatrice for the city?

A. Yes, sir.

Q. You filed a report?

A. Yes, sir.

Q. When?

A. I don't remember the date; I have a copy of it in my office.

Q. About how long ago?

A. In the past six or eight months.

Q. Who employed you to do that?

A. The city council committee.

Q. Can you tell me the particular individual?

A. The city council committee, I have forgotten the name of the particular member.

Q. Were you at Beatrice?

A. Yes, sir.

Q. For how long?

A. One day.

Q. How long during that day?

A. Between the trains; I have forgotten.

Q. About an hour?

A. Oh, it was longer than that; I got there sometime in the forenoon and left some time in the evening.

Q. What that the first time you had ever been there?

A. Yes, sir.

Q. You went in from the east on the train that leaves Omaha about eleven o'clock?

A. I don't remember that.

Q. Anyway you left on the next train that came east?

A. I don't remember that; I was there something over a half a day.

1074 Q. But you don't remember the name of the individual who made the arrangement with you?

A. No, except he was the chairman of the committee of the city council having the matter in charge.

Q. Do you know that?

A. Yes, sir.

Q. Where did he meet you?

A. In Beatrice.

Q. This day you were there?

A. Yes. I met him in the store in which he was employed; I think it was the furniture store.

Q. Were you ever there since?

A. No.

Q. Were you ever back after that half day?

A. No.

Q. This individual who you say employed you, did he furnish you any of the facts and figures?

A. Yes. The city council committee had agreed with the Gas

Company as to the major portion of the facts concerning the property, and these facts had already been tabulated.

Q. The man furnished you this information?

A. The city council committee gave me a copy of that, and later in the presence of the manager of the Gas Company, I was advised that this was agreed to by both parties.

Q. Was there more than one of the council present when you got that statement?

A. I don't recall that. There were other men there but I don't remember whether one or more of the other two members of the committee were there or not.

Q. And you don't remember their names, any of them?

1075 A. No, sir.

Q. What was the Gas Company manager's name?

A. Rice.

Q. You met him over there?

A. Yes, sir.

Q. Was that the first time you ever met him?

A. Yes.

Q. Was that work going on in January last?

A. I don't remember.

Q. Was it since January?

A. I think so.

Q. Your report was filed since January?

A. Yes, I know it was since January.

Q. You came to Des Moines you said on the 13th of January?

A. Yes.

Q. In response to a telephone message?

A. Yes.

Q. Now, in the telephone message were you told the character of the work that was expected of you, the controversy that was on?

A. Not at all.

Q. You were simply asked to come here?

A. Mr. Haines asked me if I was so fixed that I could come to Des Moines that night for a matter he wanted to go over with me the following day. I asked him if it was urgent, and he said yes, and I came the same night. This telephone message was on the—and I arrived on the morning of the 13th.

Q. And your employment was arranged that day?

A. Yes.

Q. You began your work for the Gas Company then on the 13th?

A. Yes.

1076 Q. Do you remember having some correspondence with the city of Des Moines after that time?

A. I got a letter from somebody, I believe Mr. Brennan, asking me if I was available for work of this sort.

Q. That was some time after the 13th of January?

A. Yes.

Q. You wrote Mr. Brennan, did you?

A. Yes.

Q. Did you advise him you had been employed by the Des Moines Gas Company?

A. No, sir.
Q. Did you say anything about that in your letter?
A. I did not.
Q. Do you remember the date you got the letter first from the city?
A. No, it is in my office though, could be obtained easily.
Q. It was quite a long time after the 13th of January?
A. Oh, perhaps a month or two.
Q. I don't remember whether you stated in your examination whether you were a graduate of any school of engineering?
A. I am not, no.
Q. Your training along that line has been out of school?
A. It has been in school only so far as I could carry on school work in connection with the operation of plants.
Q. When did you come back to Des Moines after the 13th to go to work?
A. I went to work immediately.
Q. You didn't return to Chicago?
A. No, I stayed here something over two weeks before I went back.
Q. Then you were here in Des Moines at the time the city through Mr. Brennan wrote you, were you?
A. I don't know whether I was here at that time or not.
1077 I did not receive the letter here; that came to me while I was in Chicago.
Q. You went to work then on the 13th?
A. Yes.
Q. Did you at that time make any inquiry of the manager of the Gas Company about the property and about the investment in it and about the capital of the company?
A. No, sir.
Q. No questions of that kind were asked?
A. No, sir.
Q. Did you make any investigation of the Company's books or papers or records at that time for the purpose of ascertaining any fact with relations to the company's valuation of its own property?
A. No, I studiously avoided all that. I did not want to have any of the company's figures in my mind in any way concerning the value of the property.
Q. You did not care anything about their figures?
A. I wanted to make my own valuation.
Q. If I understand you, it made no difference to you at all, upon the theory which you pursued to make this valuation, what the company paid for their property or what the company considered it worth; you wouldn't give their valuation any weight whatever in arriving at your conclusion?
A. No, sir.
Q. In other words, you proceeded upon a theory of your own that had no relation whatever to any element or item of value that might appear from the company's books or records?
A. I took particular pains to avoid getting any information from the company——

Q. Please answer the question.

1078 Mr. GUERNSEY: I think the witness is entitled to complete his answer.

Answer continued: as to any value the company might place on its equipment and as to any indicated values of the property that might be taken from the books.

Q. But you proceeded upon a theory of your own that had no relation whatever to any element or item of value that might appear from the company's books or records?

A. I have answered it.

The MASTER: When you can answer a question yes or no, it is always best to do it.

Mr. BYERS: We will take an answer.

A. I cannot answer that by yes or no and make my answer complete.

Q. What part of it are you unable to answer by yes or no?

A. I have no right to claim some one theory under which I am making this valuation; it is not peculiar to me; it is a standard method recognized as being correct. I did follow this method which I recognized as standard and did not try to get from the Company any indication as to its information of the value of the property.

Q. In other words, to put the question to suit your notion, you proceeded to place a valuation upon the property without reference to any element or item showing the value that appeared upon the Company's books or records?

A. Yes, sir.

Q. Did you ever, in any of these other cases, where you have appeared as a witness, proceed in that way?

A. Yes, sir.

Q. In what case?

A. At Taylorville.

1079 Q. Have you been a witness at Taylorville?

A. Yes, sir.

Q. When?

A. Within the past few months.

Q. At Taylorville, Illinois?

A. Yes, sir.

Q. Where else?

A. That is the only place I have appeared as a witness.

Q. Have you ever made a report anywhere that was worked out upon the same theory and basis that your report in this case is worked out?

A. I have made a large number of reports, but never made any on any other basis; they have all been on this basis.

Q. All been on the basis of your report here?

A. Exactly.

Q. Including the going value?

A. I have not in all cases calculated the going value because I did not know how until less than a year ago.

Q. Have you in any case before worked out the going value as you have worked it out here?

A. Yes.
Q. Where?
A. In Chicago.
Q. In this report you made for the Gas Company?
A. It is a part of that report; it is not in the bound volume.
Q. It is not in the bound volume?
A. No.
Q. Is it a separate part of the report?
A. Yes.
Q. Any other place?

A. Not with the same detail as we have here. I have ap-
1080 plied it in other places.

Q. Well, give us the detail or rather the method in which you have applied it in any place where you say you have dealt with going value before.

A. Well, I applied it in a general way at Taylorville. I applied it in a general way at Omaha.

Q. What do you mean by general way at Taylorville?

A. I did not have the particulars required there, as to the records of the company in such detail as you would have to have to enable you to make a calculation in as great a detail.

Q. Then you did have the records of the company to work it out here?

A. That is admitted; of course that is shown by the calculation itself.

Q. You stated on yesterday you did not agree in all respects with the figures furnished you by the company and so in some cases you adopted your own; have you with you the itemized statement or invoice of fact and figures furnished you by the company upon which you base your report?

A. I am not sure. No, I have not; it is a copy of the inventory; the minor differences which are indicated here, is in my room.

Q. What is in your room?

A. The copy of the inventory on which my report is based.

Q. You have it here in Des Moines?

A. Yes, sir.

Q. I wish you would bring it in at the next sitting of the court and have with you all memorandums furnished you by the company, purporting to show the entries in their books with respect to the mains and services and operating expenses and all that class of figures.

A. I have no record purporting to show the entries in their
1081 books. The only figures I have are summaries.

Q. What do you mean by summaries?

A. The only figures I have, for instance, as to the street main system, for instance, would be the total number of miles at the end of a given year. I have not the detail as to the number of feet of each and the size of pipe at the end of that year.

Q. What I want is what was furnished you, if you bring that in that will be all that you can bring in. You stated in your examination in chief that the reproduction method was the accepted method;

who do you have in mind as having accepted that as the proper method of ascertaining the value, and the exclusive method?

A. It is the accepted method among the investing men of this country.

Q. Well, who do you mean by investing men, gas companies?

A. Not only gas people; people investing in utilities of all kinds, banks and bond houses and individuals.

Q. You stated too you had made an inventory and valuations for bond companies heretofore; can you give me the name of a bond company for which you prepared an inventory or valuation of gas property in which you dealt with the going value as you have here?

A. I can give you the name of a bond house in which I dealt*h* with going value, but not in the detail I show here.

Q. Give us the name of the company?

A. I would rather not do that.

Q. Why?

A. Because the business is of a confidential nature.

Q. The name is not confidential?

A. That is a part of the confidential relationship, I am not supposed to divulge.

Q. When was it?

1082 A. Well, several times; perhaps four times.

Q. When was the last one?

A. About a year ago.

Q. Now you say you did not deal with the going value in the same detail; how did you deal with it in that case?

A. It has been customary for a great many years to make an allowance for going value, but nobody has had in the gas industry any specific means to calculate the amount of the going value. It has been customary to take sometimes a year's gross income as the going value; sometimes a fixed sum per meter; like $30 per meter; sometimes a percentage of the reproduction cost of the property; and these methods are all more or less arbitrary and not specific enough to compare favorably in my opinion with the scheme we have followed here.

Q. You don't mean you have any better means or any more convenient way of getting at the facts and figures now than you had in years ago?

A. A very much more conclusive method than ever before.

Q. In what?

A. In that it shows all the elements which make up the total.

Q. You said a moment ago the reason you had not done it before was because you did not have the means; what did you mean by that?

A. The method itself is one which has not been used in the gas industry until within the past year. It has been used in other industries and has only recently been adapted to the gas industry.

Q. Do you know of any other consulting engineer that has dealt with going value as you have within recent months?

A. Oh, yes.

Q. Outside of any of the witnesses in this case?

A. Yes.

1083 Q. Who is one?

A. Leonard Metcalf of Boston.

Q. Who is another one?

A. John Alvord of Chicago.

Q. Those are both water men?

A. Exactly.

Q. Neither have worked out any such method in a gas case as you have here?

A. No, sir.

Q. Can you think of a single engineer dealing in gas other than yourself that has dealt with going value as you have here?

A. Yes, sir.

Q. Who is he?

A. Harry Abel, 40 Wall Street, New York.

Q. Anybody else?

A. Henry L. Doherty.

Q They have both dealt with gas cases and worked out the going value as you have?

A. Yes, sir.

Q. In any cases involving any court proceedings?

A. Not in any case which has yet come into court so far as I know.

Q. Do you know of any rate commission anywhere in the United States that has adopted your method and approved it?

A. I do not believe this method has ever been applied in a rate case before a commission in connection with a gas company; it has been applied on water companies.

Q. Do you know of any commission anywhere which has adopted this method as to water companies?

A. I know of commissions before whom the scheme has been presented.

Q. I am not talking about that. Do you know of any com-

1084 mission anywhere in any of the states that have adopted or approved your method of getting at the going value?

A. Not as a whole.

Q. In referring to your going value in your examination in chief, in trying to illustrate it to the Master you spoke about the grocery business. I wish you would tell the Master now what you understand the term good will means.

A. I understand good will to be that which prompts the individual buyer to go to one source of supply rather than to another when the prices of a given commodity and quality of that commodity are the same in the two cases or two places of sale.

Q. That is to say, take your illustration of the grocery store—if a grocer has spent several years in building up a trade and getting a large number of customers who confine their grocery business to him and buy of him, that is what you would consider the good will of that business?

A. I would consider it good will if there were some competing

grocer there who carried as good a stock as the other stock at the same price and there was some personal element that prompted the buyer to go to the man who sold the larger amount.

Q. What is your notion now of the difference now between good will as you have described it and the volume of business of the grocer?

A. I did not undertake to make any comparison between good will and the volume of business.

Q. Is there any?

A. Not that I know of.

Q. Then you want the Master to understand that there can be no such thing as good will unless there is competition?

A. I didn't say that.

1085 Q. What will you say about that?

A. There is a good will in a public utility, but not in the sense of a grocery store. A grocery store may carry exactly the same kind of a bean that the next grocer carries and may sell at the same price per pound or quart and there may be no one deciding factor as to which store will sell that bean except good will. The gas company is selling a product which has no exact duplicate in the city. It has competition. There is electric light, gasoline, kerosene, wood and coal, but there is no other supply of gas. Coal, wood and kerosene and gasoline may be used in place of gas for certain service, but there is no one other thing which will do all the things gas will do; consequently the competition is not exactly parallel.

Q. You knew, of course, when you came here to make this valuation that there was no other gas concern in the city of Des Moines?

A. Yes, sir.

Q. You knew so far as gas was concerned, for both illuminating and fuel purposes, the Des Moines Gas Company had a complete monopoly of the sale of this article for this purpose?

A. Yes, sir.

Q. So it was your notion then, since there was nobody else selling gas in this territory there could not be any such thing as good will and you would have to call it something else?

A. No, sir; there is a very distinctive element of good will in the Des Moines Gas Company.

Q. What is it?

A. It is not an item which I have tried to calculate or which I have included in any sense in any of my figures.

Q. Why not?

A. Because I don't know how to figure it.

1086 Q. What does it consist of?

A. You might say it is that attitude on the part of the public which prompts the public to use gas for lighting, when it might use electricity, kerosene or gasoline; it is that attitude on the part of the public which prompts the use of gas for cooking when it might use coal or coke, wood, kerosene or gasoline, and some of those things in some cases would do the work for less money than gas.

Q. Right at that point, how does that attitude come about, if it is

good will, who is it that brings about that attitude and how does that do it?

A. The company very largely brings it about through advocating its gas for fuel and educating the people to the use of gas for illuminating purposes and fuel purposes.

Q. Is not that exactly what you tried to work out here as to going value?

A. Not at all.

Q. No part of the education of the public to the use of gas is included in your so-called going value?

A. No, sir; I have very specifically assumed in that calculation that the state of education of the public with respect to the use of gas in the hypothetical plant is exactly as it is today in the city of Des Moines. If I were to assume that that education would have to be developed, I would have to add at least one hundred per cent to the going value shown in that calculation.

Q. Are we to understand that you assumed in your method as a basis of your calculation for going value here that all of that part of the work, of the gas company was already accomplished and existed here and did not belong to anybody?

A. I have assumed that the people in the second city in
1087 which the hypothetical plant is to be built already knew about the advantages of gas and were ready to take on the supply of gas.

Q. I thought you worked it out by saying that only a few used it the first year and then a few more the next year and so on.

A. Exactly so.

Q. Now if the Des Moines Gas Plant had blown up a day or two after you came here and the Des Moines Company had gone out of business and a new gas company started, do you think then it would take three or four or five years to get the people to using gas again?

A. It certainly would if you had to again begin to relay your entire distribution business and take on people who had not been used to gas and had only an education as to the advantages.

Q. That is what you call your going value, the difference between the number of people who use it in your so-called hypothetical plant and the number of people who use it in your going plant?

A. Distinctly not.

Q. Tell us more clearly what factor or weight, if any, the extent of the consumers had to do with your so-called going value.

A. That is shown very clearly in my calculation.

Q. I want to know what if any weight you gave to the question of the number of consumers?

A. What number of consumers; where?

Q. Where were you dealing with consumers?

A. This calculation shows clearly, I have considered the number of consumers in each of the three districts. I have considered the possible rate of development of the business of each of this class of consumers in each district.

Q. Development, who is going to develop them; what do you mean by development?

1088 A. You have got to admit that a consumer who has taken on a supply of gas today for the first time, does not, if he is an average consumer, does not equip his house with all the classes of appliances which he will have later. He first puts in one of the appliances and the meter goes in, and he runs along for a while slowly, and then he finds out it is an economical thing, and after a while he wants another kind, and so from time to time he adds appliances; as he adds appliances he naturally increases the gas consumption per meter per year. But that does not come instantaneously. If you had a community like Des Moines as to intelligence concerning the advantages of gas, but which had not used gas, and you were to suddenly turn on a supply of gas, these people would not immediately use gas at the rate they would ultimately use it. They would take on one appliance at a time. The consumption per meter would grow as they became more familiar. They might have known beforehand the advantages and economies; in a great many cases they might not have had the amount of ready cash; so the growth is gradual.

Q. So, then if I understand you, it is the difference in the earning power, or the actual earnings, if I may put it that way, between your so-called going plant and your so-called hypothetical plant, because of the necessity of this growth and development and this period of time that must elapse before the consumption will in the hypothetical plant equal the consumption in your so-called going plant, that you call going value?

A. It is not.

Q. Tell us what it is?

A. You mentioned one of the items only that enter into the going value.

1089 Q. How much of an element is that?

A. I can perhaps answer that better by showing what effect the rate of development would have if we assumed, instead of being able to catch up with the going plant in this case in seven years, that it would require ten years. Obviously the going plant would have a still larger lead over the hypothetical plant than it now has, and the going value of the existing plant would be correspondingly increased. By reducing the time required in the development of the business of the hypothetical plant you reduce the going value of the going plant. Now that is clearly only one of the elements entering into the calculations.

Q. How much of a figure does that cut in your final conclusion as to the amount of the going values; what part of it do you attribute to that?

A. Well, if we take a plant in which a ten year period is required, we arrive at a going value——

Q. You took seven years, didn't you?

Mr. GUERNSEY: I think the witness ought to be allowed to answer the question.

Answer continued: of say $1,400,000. This is not Des Moines

I am speaking of. If we assume a five year period for that same plant, we get a going value of about one million dollars.

Q. Let us assume a period of one year; let us take Des Moines, where we are, the place that we are talking about: the Des Moines Gas Company, we will say goes out of business, quits, plugs up their mains and quits business, say on the first day of January; now if I understand your testimony the Des Moines Gas Company, the going plant you talk about had some 19,000—we will use that number for illustration—consumers in Des Moines, people who know all
1090 about the advantages of the use of gas and knew all about what could be accomplished with it in their homes—now a new gas company is to take over this field and put in a plant; what would they have to do in order to reach these 19,000 consumers?

A. That is obviously not a fair comparison.

Q. Just answer the question; you are too much inclined to argue.

A. I can't answer it yet; he has not told me whether the new company had taken over the existing mains.

Q. The new company has taken over nothing, is just simply going to start in here to serve 19,000 people already educated to the use of gas, what would they have to do to reach that?

A. The parallel is not yet reached, because you are assuming a house fully equipped with gas appliances.

Q. I am assuming nothing; I am taking the situation just as you found it in Des Moines, with gas appliances in a certain number of homes and with gas being used by a certain number of the people, whatever that number is, as shown in your report and in the figures furnished you: that is all I am assuming; I want to know just what the company would have to do, what expenditures it would have to make before it could serve all of these people other than to just simply put the mains in and put in the services, install the apparatus at the plant, get their fuel, build the fire and start the machines and install their meters.

A. You cannot calculate going value on such assumptions; they are not fair.

The Master: Answer his question.

A. I cannot answer it; he is making assumptions that do not fit each other.

Q. In order to make your theory hold, you have to have a case to fit the theory?

A. No, sir, you have got to have conditions which can be
1091 reasonably and fairly assumed to be found.

Q. Now let us see if there is anything here that can be reasonably assumed. You knew before you got up this so-called hypothetical plant and carried out this comparison between the so-called going plant and the hypothetical plant, you knew you were making figures to be used in this lawsuit?

A. Yes, sir.

Q. You knew you were making your figures with reference to the situation existing in the city of Des Moines in January last?

A. As of the date January 1st.

Q. Now you knew at that time there were about 19,000 people in Des Moines, or 19,000 places where they were using gas?

A. Yes.

Q. So that you knew at least that many people had been educated up to the point where they knew what gas was and what they could do with it, and you knew there were about that many places being served with gas?

A. Yes.

Q. Now, then, there is nothing about any of those things that are assumed and unfair?

A. No, it is your next step that is unfair.

Q. The next step is that the gas company serving these people quits business?

A. Where are you going to allow the credit for the work already done by the Gas Company? You are taking advantage of work done by somebody else without making credit for it, which is unfair.

Q. I want to know now, take the new company, the hypothetical company that is going to start in here now and put in a plant and occupy this field of the Des Moines Gas Company, which it
1092 for some reason or other left; it is not important what the reason was; what would that new gas company have to do to reach those 19,000 consumers.

A. If it were humanely possible to duplicate the conditions which you have outlined, then of course, the going value of the existing plant would be less than it is; but it is not humanely possible to duplicate such conditions.

Q. You don't answer that question at all. What did you start out with in your report as the necessary thing to be done by your so-called going plant and so-called hypothetical plant?

A. I started out with the one purpose, of drawing a comparison between——

Q. I didn't ask you the purpose. I want to know what figures, what work you started with, whether the promotion of the company or whether it was putting in mains; what did you start with?

A. I started with the preliminary organization and expense of the hypothetical plant.

Q. That is what your new company had to do?

A. Certainly.

Q. And that covered the whole period of construction, didn't it?

A. Some of the expenses are spread over a period of three years.

Q. Your new company would have to do that thing and would have to put in those mains and put in the apparatus?

A. Yes.

Q. And make the connections at the houses, and as soon as that was done you would be ready to commence to serve these people.

A. As soon as they had the connections made.

Q. Would there be any going value there?

A. Very clearly.

Q. What would it be?

1093 A. Are you assuming now that each of the consumers at the present lines of the old company are also fully equipped with appliances for the hypothetical plant?

Q. Their houses were already equipped; you stated that you took Des Moines as it existed now, with its education and necessarily you must have taken it with its gas connections.

A. I did not so take it.

Q. You proceeded upon the theory that there were no connections?

A. I spoke specifically that I took Des Moines as it is in all respects, including the present state of education as to the advantages and use of gas, but without gas appliances in the houses; those appliances have got to come gradually; they cannot come instantaneously; they never do.

Q. If I understand you, the method you adopted, you proceeded on the theory that your hypothetical plant was going to be built in a town purely hypothetical, except that it had been educated to the use of gas?

A. I took an adjoining city exactly like Des Moines in all respects, including the education of the public as to the advantages of the use of gas, but omitting the gas plant and gas appliances in the houses of the consumer, what does it cost to reproduce the condition existing in the first city; that is what my calculation shows.

Q. You have been around the world a good deal—do you know of any such city?

A. I have not tried to find one.

Q. Do you think there is any such?

A. No.

Q. A city of that kind don't exist?

A. It is not necessary they should exist for the purposes of
1094 this calculation.

Q. Take your own city, which don't exist, and see where you come out—we will assume Des Moines is the kind of a city you are talking about, without any gas connections, but they are all educated to the use of gas, at least 19,000 of them are educated here; now what other than just the promotion expenses would the new gas company have to go to in order to reach these 19,000 consumers?

A. The promotion expenses are the new business expenses.

Q. I say other than promotion expenses?

A. That is all I have allowed for in addition to physical equipment.

Q. This so-called new plant—if the Des Moines Company would go out of existence, what would it have to do in the way of expenditure of money or time or anything else, other than the expense of installing and purchasing this apparatus, and installing its plant, putting in its mains, putting in the service connections and paying the cost of the expenses of all that work, and connecting up its machinery, or anything else.

A. It would have in addition the promotion or development expense required in bringing these people to the use of all the appliances they now have.

Q. But they are already educated to that?

A. They are educated as to the use of them, but they are not practiced in the use of them.

Q. They never used gas?

A. You may have lived in a city all your life and know all about the use of gas, and if tomorrow you moved into a residence and you begin to use the residence for the first time, you will not begin on a scale which you will finally reach.

Q. You take out somethng else besides the service con-
1095 nections; now you say it must be a city with people in it who have never used gas?

A. I didn't say they had never used gas; I say they must be educated to the use and advantages of gas.

Q. How, what sort of an education?

A. Well, some of them may have lived in other cities where they may have had gas, but the major portion in every city become acquainted with the advantages of gas through the development work of the gas company.

Q. Well, then, to make your theory work out now, give it the credit that it ought to have in the mind of the Master and the people involved in this controversy, you have got to have a hypothetical plant worked out as you worked it out, and you have got to have a hypothetical city where the people are not using gas and where some of them have found out how to use it by living somewhere else?

A. The city as a whole must have the present state of education of the city of Des Moines with respect to the use and advantages of gas.

Q. And those that never have used gas, you have got to have that?

A. That doesn't follow.

Q. If they use gas and know all about it because they use it that ends the proposition to educate them?

A. If you take a city exactly like the city of Des Moines, you will find lots of people fully acquainted with the theoretical advantages and with the costs and use of gas, who have never used gas.

Q. Then none of these people in this hypothetical town have ever used gas?

A. No, I didn't say that.

1096 Q. How many have used it?

A. I don't care how many of them.

Q. You don't care if none of them have used it?

A. All I want them to have is the present state of education in the city of Des Moines as to the advantages and economies of gas. If they have used gas before they are not going to jump in with a full complement of gas appliances right off the bat; most of them haven't money enough to buy it.

Q. Do you know of a single city anywhere in this country now, that in the constructions of its buildings, its new homes and its new business houses those appliances are not all put in with the construction of the house or homes?

A. I don't know of any city anywhere where those appliances are all put into any district, and it is not to be found.

Q. What part don't they put in?

A. There is no city in the world that installs all of its gas appliances when the buildings are put up.

Q. What do you mean by gas appliances?

A. Some new houses are piped for gas.

Q. What do you mean by some new houses?

A. Your question covered the situation in which all the work was done in all the houses.

Q. What proportion of the houses is it not done in?

A. It varies widely with the character of the cities. There are a great many cities in which it is a rare case to see a house piped when it goes up.

Q. Do you know a single modern residence built in Chicago recently which was not all fully piped for gas?

A. It is the exception to find a modern house fully piped for gas and electricity.

1097 Q. Then you have got to have a city with homes in which necessary plumbing for gas has never been made?

A. Have you; I didn't say that. This second city is to be identical with Des Moines in all respects, except that it has no gas plant and has no gas appliances in the houses.

Q. And never had any?

A. Never had any.

Q. What do you mean by gas appliances in the houses, piping?

A. Devices for consuming gas.

Q. You mean stoves and lamps and such things as that?

A. Yes.

Q. The piping is to be there then in your hypothetical plant?

A. If you do not grant the piping is there you are going to involve the period of construction, which would be reasonable.

Q. If the piping is there, the gas company has covered, of course in the laying of the pipes and the making of connections and installing of all its parts, that has all been covered in your construction account?

A. Yes, the account shows exactly what it is.

Q. So that everything up to the very point of turning on the gas, at the wall, if I may use the term, is there in your hypothetical plant?

A. My construction figures go to the outlet of the meter, because that is as far as the company goes. House piping is the work of the house owner and house piping belongs to the owner.

Q. In your hypothetical plant that is all there?

A. Yes, the piping is there. I am trying to arrive at a fair basis and it is necessary in order to be fair to assume that those pipes are in there, because if you do not do that you are going to assume that the gas company are putting in that piping, and you are

1098 going to increase the period of construction and increase the going value.

Q. In order to make your theory work at all you have got to assume just what you now stated, and at the same time assume

these other things that people never use gas in their homes, although they are piped and all that sort of thing?

A. The house piping is omitted from the calculation; it is not a part of the property of the company.

Q. Does the gas company own the gas stoves?

A. No, sir.

Q. You assume that there were no stoves in those homes?

A. There will be before the plant is thoroughly in operation.

Q. Your hypothetical plant would not run at all without appliances in the house?

A. These appliances go in as the work is indicated to progress in the figures.

Q. How do they go in?

A. The gas company puts in the stoves and appliances.

Q. But in your figuring out this so-called plant you assume those things get into the house by request of the owners or does the Gas Company put them in?

A. The Gas Company sells them to the house owners at a price which barely covers the stoves and appliances, whatever they may be.

Q. So you have assumed in your method of arriving at this going value that the supply here in Des Moines would only take these things gradually, covering the period you figured out?

A. I assumed that because that is the history of every Gas Company in the world.

Q. You have to assume that here in order to make your plan work, don't you?

1099 A. This plan will not work unless you stick to conditions humanely possible and in accord with practice.

Q. Please answer the question.

A. You don't assume it in order to make the plan work.

Q. Where is there a typical city, then, such as you have worked out, if you don't have to assume it?

A. I didn't say you don't have to assume it.

Q. If you didn't assume it, the plan wouldn't work?

A. This plan wouldn't work unless the things you assume are reasonable and within the limits of human possibility.

Q. It won't work there unless all those elements we are talking about are assumed to exist?

A. It is a hypothetical plant and you naturally have to assume each of the elements in it.

The MASTER: If you can't answer the question, say so.

Q. In order to cut this short, Mr. Lea, just tell the Master what you have assumed in making up your hypothetical plant, was the condition of the hypothetical town in which the plant was to work with reference to the use of gas; just state it.

A. I have assumed a town of the same size, and kind, and each of the characteristics throughout as the city of Des Moines; that there isn't any gas plant in the town; that there is none of the property which belongs to the company in this city, in this hypothetical town, that none of the gas appliances to be found in Des Moines are in this hypothetical plant, but that in other respects the towns are

identical. The gas ranges and meters and the piping is not the property of the company and is assumed to be in the houses, but the fixtures and stoves and water heaters the company puts in are not there.

Q. Now in making up your figures for the purpose of
1100 finally arriving at your conclusion, that is taking the figures as you worked them out, in a hypothetical plant from the sum total of the going plant to arrive at this so-called going value, you have worked out this scheme by which the hypothetical plant after its installment gradually grows up to the point where it will be furnishing about the same amount of gas and about the same number of consumers as the going plant, is that right?

A. Yes, sir.

Q. And in doing that now, making your figures on your hypothetical plant, you have figured every single item of cost?

A. Not every item.

Q. Every single item of cost, or rather you have placed a value yourself upon every single item of material and labor, and machinery, use of money, that is required to bring the plant up to a point where there is nothing to do on the part of the consumer but to attach his house appliances, is that right?

A. That is not quite right. It goes beyond that necessarily, to the point at which these appliances are connected up and in use to the extend now found in the city of Des Moines.

Q. Last question repeated.

A. That is not right.

Q. What have I left out?

A. You have to develop the business until it will bring about the demand.

Q. Develop business how?

A. You are ready now to supply the gas appliances in the average consumer's house, and the average consumer, we will say, is ready to put in one of the appliances, but the average consumer will not put in any more than one, and a period of development is re-
1101 quired before he will have taken on as many appliances as he will have to-day in the city of Des Moines.

Q. You get at that period of development by a process of reasoning and figuring that must necessarily be based upon a town of the size of Des Moines, without anybody in it?

A. That is not so.

Q. Without anybody in it that has been educated up to the use of gas?

A. No, sir.

Q. What do they have to do in order to get them to use gas other than what is covered when they get the gas piped up ready for the house fixtures?

A. As I understand it that is not what you started out to say.

Q. Well, that is what I tried to say.

A. I will answer the first of these two questions. You do not arrive at the rate of acquisition of business in the hypothetical plant by studying nor making figures concerning the hypothetical plant.

You apply your judgment in the matter through having had experience in smaller towns and larger towns in exactly that kind of work.

Q. That is what I wanted to get at; what do you mean by that kind of work?

A. The development of business.

Q. Well, how?

A. By advertising, soliciting and demonstrating.

Q. Advertising what?

A. The use of gas and gas appliances.

Q. To those people who ought to know all about it?

A. Yes, sir.

Q. You have to go through an additional process of education through advertisement and so on?

1102 A. You have to maintain that work. Even the Des Moines Gas Company, with all its present connections, cannot afford to stop advertising.

Q. The kind of education you are talking about is theoretical and not practical?

A. Distinctly not.

Q. The education you think they already have is a practical education that comes from the use of gas?

A. I am not saying that a person already educated must be again educated to that same stage.

Q. What do you mean?

A. He must be carried along and advised as to the new developments that come on and his neighbors have to be advised about this intelligence.

Q. That is the new population?

A. You have to keep advising them always.

Q. It is for that advice you figure out this $583,000?

A. Distinctly not.

Q. What part?

A. A small part, which you can find by looking at the figures.

Q You find it?

A. I cannot without going through some calculations there.

Q. Give me your best judgment about it, I'll be satisfied without your going through it.

A. By that you mean to ask me what proportion of this $583,00- is required for the additional education of the community?

Q. Not additional education, the education you say is necessary to bring about the sale of gas.

A. The education as such represents a very small fraction, but I should say the total education which you are describing would be covered by five thousand dollars through this period of seven years.

Q. Five thousand dollars, you think that would be about

1103 right?

A. I should judge so for the feature you are describing.

Q. That would be for the advertising?

A. Distinctly not.

Q. How would it be expended?

A. That is for the—as you choose to use it, education of people who already have this education.

Q. What does the company do?

A. The company spends the money for advertising, solicitors, and demonstrators, people to go around from house to house to educate the cooks and housewives to the exact manipulation of these appliances.

Q. When they spend money for advertising what account does that go to?

A. That goes to new business.

Q. How is it charged up on the books, as operating expenses?

A. It is a legitimate operating expense.

Q. The consumer pays that right along?

A. Yes.

Q. Then on top of that he would pay the other five thousand dollars?

A. If he didn't pay that, he would never get the reduced prices in gas.

Q. On top of that you figure he must pay this additional five thousand?

A. That is my rough estimate, what you might possibly squeeze out of this thing in seven years. It is not an item I had thought of at all.

Q. This five thousand dollars—what is involved in the balance of it in a general way?

A. The figures will show a whole lot better than I can say off hand.

Q. We do not really understand your figures.

1104 A. If you ask specific questions, I will explain them.

Q. Question repeated?

A. I can only answer that by referring you to the figures.

Q. I don't want to be referred to the figures, I want you to refer to them and tell me after you refresh your recollection from them, if you have to do that, then give me the information the question asks for.

A. You want to know what makes up the balance of the development expense?

Q. Yes, in a general way.

A. There would be the cost of the salaries in the new business department.

Q. That would be charged to operating expenses?

A. Certainly.

Q. What next?

A. The cost of advertising.

Q. I have just covered that—five thousand dollars.

A. You have not.

Q. That wasn't any part of this five thousand dollars?

A. You might take it out of advertising if you want to. You haven't covered the period of seven years.

Q. What did you intend to cover?

A. I didn't intend to cover any such item as you bring up.

Q. What did you intend to cover?

A. Just advertising.

Q. How much would you say for advertising now?

A. That is spread through a series of years shown in the report under the head of advertising.

Q. What is the sum total?

A. I don't know.

1105 Q. If you don't know, the Master don't know, and neither do the rest of us know.

A. It is not shown that way. The unit cost cer thousand feet of gas sold for the year——

Q. I am talking about the advertising item?

A. That is exactly what I am talking about. I can figure it out but it will take me about an hour to do it.

Q. Well, figure it out.

Witness makes calculations.

A. As I understand you, you want the total figure I have included for advertising by the hypothetical plant during the period covered by this calculation. That total is for the hypothetical plant $67,802, as near as I can calculate it from these units.

Q. Now, if the Master or counsel desire to separate these items they will have to do as you have taken them up and figure it out?

A. In the absence of the figures I have in my office they will have to.

Q. Can you bring them?

A. I used the units wherever it would save time.

Q. Give me those figures again?

A. For the going plant $47,964. In other words, according to my figures the hypothetical plant will spend for advertising through the period under consideration $19,838 more than the going plant will spend for that same item through the same period.

Q. The going plant was how much?

A. $47,964. You will please remember I am working that with four decimal places here, and it might not be absolutely accurate.

1106 Q. That figure is reached by the process of percentages and not by the actual figures from the books?

A. That is reached by an allowance per thousand cubic feet of gas sold.

Q. It is not figured in the books?

A. No.

Q. It is your own estimate of what the advertisement expense of the going plant is?

A. It is based primarily of course on what I would judge the existing company is spending at this time.

Q. But you made no effort to ascertain what the existing plant was paying?

A. Yes, I did, but didn't use those figures.

Q. The figures you got were much less than those used?

A. They were not the same: I don't remember whether they were less or more.

Q. At any rate, you disregarded them?

A. Yes, sir.

Q. Of course, to arrive at the $47,964, you adopted some method of percentages?

A. You might call it percentage. It happens to be based on percentage. My units is so many cents or parts of cents per thousand cubic feet.

Q. In all of your computation wherever the question of rate enters into it at all, you proceed on the theory that the rate was a dollar?

A. Oh, yes.

Q. The hypothetical plant was how much?

A. $67,802. That is the total expenditure I estimate will be necessary for advertising the hypothetical plant throughout the period of seven years.

1107 Q. Now, Mr. Lea, I notice on page 112 of Exhibit 20—operation and maintenance hypothetical plant. I notice the tables there on that page under the head of new business, you say it is based on cost per thousand accounted for; that means these figures rest upon the sale of gas, that is, the gas that is actually received by the consumer at a dollars per thousand?

A. I have explained what gas accounted for means; it is not just what you said, but I presume what you mean. Gas accounted for is the total of gas that passes through the consumers' meters, plus the gas used in the office of the company and works of the company and plus the gas used on the street lamps.

Q. And at a dollar per thousand where the consumer gets it?

A. Yes, sir.

Q. Under that head you have advertising, appliances and demonstration; just what do you mean by that?

A. It is necessary in order to get those appliances in use generally to have people come along who are familiar with them to demonstrate the use of those appliances, either in the show room of the company or specially rented halls. There are demonstrators who make their living going around the country and teaching the people the use of those appliances.

Q. That sort of business is being done by the present Company?

A. Yes, sir.

Q. In its retail office or the room up on Seventh Street?

A. Yes.

Q. They carry a stock of fixtures and stoves and appliances used in connection with the gas heaters and gas lighters, do they not?

A. Yes, sir.

Q. And do a regular retail business?

1108 A. Yes.

Q. Now it is for demonstrating the use of these appliances in the store that this item is applied *to* if it was applied at all to the going plant?

A. Yes, of course in the hypothetical plant we would have to do more demonstration than a plant which is already going through many years. You are taking on a very much larger volume of business per year and you must consequently deal with a very much larger number of prospective consumers in the year.

Q. But however that may be, it is for that same work you have allowed this in your hypothetical plants, this figure of .1499 on page 112?

A. No, that figure is .0177 for 1913.

Q. It is .0177?

A. Yes.

Q. Now, the next thing is expense soliciting; how do you distinguish that from appliances and demonstration?

A. The appliances and demonstration is handled always in the office of the company, or in some other place rented for the purpose, and the demonstrator stays there and the people come and listen to this lecture and demonstration; usually a woman is the demonstrator; the solicitors or canvassers or new business representatives of the company go from house to house throughout *that* various districts of the city explaining and arguing with prospective consumers the merits of the gas and the reason why they should put it in and all that.

Q. I suppose a good deal of this demonstration is done in the homes?

A. Some of it is done in the homes. They have some women who go from house to house and explain even beyond the lectures and demonstration down town, explain in the kitchen to the con-
1109 sumer a great many details and methods.

Q. This expense of soliciting you have in your hypothetical plant for the year 1913, if I read it right, .1499, is that right?

A. That is right.

Q. That I suppose is reached in the same way you reach your advertising figure?

A. By the exercise of my own judgment as to the amount of work required in that department for that year.

Q. Well, now, I would like to stop there long enough to ask you, Mr. Lea, for the basis of that judgment; how do you arrive at those figures—I don't mean how you figure it out here, what information do you have, what experience do you take upon which you rest figures of that kind?

A. I have been connected very directly with the development business of exactly this character in six, seven or eight different cities.

Q. Yes, I know, but you are dealing with Des Moines now, and there was but one gas plant here and you knew that when you came here?

A. Yes.

Q. And you knew too that it had been the only plant here for a good many years?

A. Yes.

Q. Why didn't you, in order to assist you in arriving at the cost or expense of that kind of work in Des Moines, go to the figures of this concern itself and see what is had been paying?

A. Because, before I made any of those figures I had made a study of the town that had satisfied me there were no conditions in Des Moines that were peculiar to Des Moines, that the obstacles and

expenses to be incurred in the development of the gas business in Des Moines were approximately those of other cities of like kind throughout the country, and I had sufficient experience of
1110 my own on which to base an estimate.

Q. Where had you ever operated a gas plant in a city like Des Moines?

A. I didn't say I had.

Q. In what way did you get this experience?

A. I have operated plants in cities larger and smaller than Des Moines and have the expenses for corresponding work.

Q. In other words, you fixed just such a figure as you in your own judgment would have expended if you were operating a plant in the city of Des Moines up to that per cent of efficiency or condition that in your judgment would serve the town or city?

A. I placed such a figure as appeared to me fair and reasonable, covering the point involved; such a figure in other words as I would explain to a prospective buyer of this plant that he might have to provide for in his future operations.

Q. Now, Mr. Lea, you started by saying, or started out to put a value on this property, such a value as in your judgment a purchaser would want to pay for the property of he was going to buy it?

A. Yes, sir.

Q. You also included or had in your mind at that time that the plant if it were bought would be operated in Des Moines?

A. Certainly.

Q. And under Des Moines conditions?

A. Certainly.

Q. Now, then, this plant had been in operation according to your figures and some maps you make here which you furnished to the Master as showing the growth of development of the Gas Company; now during those years that you covered in your maps and in your figures the development and growth of the Des Moines Gas Company was about the usual development and growth of Gas
1111 Companies in towns of this size?

A. In some respects; in other respects it has been abnormal.

Q. Of course you knew, didn't you, that you could go to Mr. Haines, the manager of the Gas Company, or to the bookkeeper and ascertain just what amount the Des Moines Gas Company had been expending or paying in expenses for soliciting to acquire the business that they had acquired in Des Moines?

A. I did not know that at that time. I did not understand the method under which the books were kept, consequently I did not know what they meant by the headings employed.

Q. Did you make any inquiry?

A. Not at that time?

Q. Suppose if you had gone to Mr. Haines or his bookkeeper and inquired of him—take the last five or six years growth of the Des Moines Gas Company business has been quite large in the last five or six years?

A. Yes.

Q. Now, if you had gone to Mr. Haines or his bookkeeper and they had advised you that their total expense for soliciting the business for these years was about one twentieth of what you figure——

A. For what years?

Q. For these four or five years growth?

A. You are assuming that?

Q. If they had said to you that the expense of soliciting this business in Des Moines, the money they had acqually paid out was one twentieth of what you figure in your hypothetical plant, would you have accepted their figures, or would you have gone on in the way you did?

A. I would certainly have accepted their figures if they
1112 could have shown me they were correct.

Q. What do you mean by that?

A. I would have to admit my judgment had been very erroneous.

Q. If as a matter of fact—take the last year for instance—let us assume it was an average of the five recent years—suppose their books had shown that for this item of expense they had only paid out one-twentieth of what you figure would be necessary in your hypothetical proposition, which figure would be correct and which figure ought the Master to take, your figure here or what they actually paid, as being the measure?

A. If the books had been accurately kept covering all the elements of this item and the books did show the total cost of this work to have been one-twentieth of what I said, then the Master should take the figures from the books and so should I.

Q. You made no attempt to get at that as I understand it?

A. I didn't consider that necessary.

Q. You made no attempt to get at the actual figures?

A. I did not at that time, no sir.

Q. Going back just a minute to your advertising, you have assumed here, and I want to go into this to test your so-called comparisons, you have assumed that the poing plant which is the existing plant, the Des Moines Gas Company, spent $47,964. for advertising for the first five years?

A. No, sir; I have not.

Q. Well, how is that?

A. I have assumed that during the years 1911, 1912, 1913, 1914, 1915, 1916 and 1917, seven years immediately following the *the* date of this inventory, the Des Moines Gas Company will have spent in the exercise of good business judgment a total of $47,964. for advertising.

Q. As I read the figures the hypothetical plant you begin
1113 with in 1913?

A. No, there is an advertising expense prior to that.

Q. Do you count seven years for the going plant and five years for the hypothetical plant?

A. Certainly, because seven years is the figures of the hypothetical plant in catching up with the going plant.

Q. The hypothetical plant according to your information, not

what the experience of the Des Moines Gas Company shows in its past history in Des Moines, or any other gas company in Des Moines, you base simply upon your judgment as to what would be a proper business management, and you say the hypothetical plant ought to spend $67,822. in these five years?

A. That total is based on my judgment.

Q. Without reference at all to the experience of the gas company that is the subject of inquiry here, or any other gas company in Des Moines?

A. I can't say that.

Q. Without any reference to the actual amount that has been used for that purpose?

A. Of course, before I made my figures I familiarized myself with the operation here.

Q. How long have you spent altogether in Des Moines?

A. I suppose five or six weeks.

Q. In that time you acquired sufficient information and knowledge of the value of real estate and buildings and the value and cost of labor, laying brick, excavating in sand and clay and all that sort of thing?

A. With the qualification I have given in the record that I did not state my valuation of the real estate was an expert valuation.

Q. What kind of valuation was it?

1114 A. It was based on the investigation I could make in the time I had.

Q. Was it a mere guess?

A. No, it was my estimate. I don't claim any specific value for my estimate on real estate.

Q. If you will pardon me for going off on real estate for a minute, you knew how much ground they had?

A. Yes.

Q. Now if you had wanted to be entirely fair to both sides, don't you think you would have made some inquiry of the company as to how much they paid for the land, and how much money they actually had invested in it, in order to help you in arriving at a fair judgment as to its value?

A. I made such inquiry.

Q. What did they tell you they paid for it?

A. I don't remember.

Q. You have it in your figures?

A. I have some data of what they paid certain individuals, and perhaps seven, eight or nine men I consulted around town as to the value of real estate.

Q. Who were they?

A. I would have to look into the record; I don't remember the names.

Q. I wish you would bring in with you in addition to the figures and records I have asked for, the names, if you can get them?

A. They are in Chicago.

Q. Of the parties you consulted about the value of real estate,

and also bring us the figures of the company given you as to what they paid for the real estate?

A. If I can find them.

Q. You have all those figures yet?

1115 A. I did have them.

Q. You don't want the Master to understand that any data now, upon which Exhibit 20 is based, is not where it can be promptly produced?

A. It might be that some of the notes I had on real estate cannot be found; I may have thrown them away, because I found some real estate down there was valued higher than I thought this property was worth. I put it in at a dollar a square foot and I thought that would meet all the requirements. I found the property worth a great deal more than that from the reports.

Q. Who gave you a report of any property down there?

A. The owners of property located almost identically to some of the property of the Gas Company, except it is on the west side of the river.

At this time an adjournment was taken until 1:30 P. M.

1116 1:30 P. M. THURSDAY, *July* 27, 1911.

HENRY I. LEA, being continued on cross examination by Hon. H. M. Byers, testified as follows:

Q. What I was inquiring about at the time of the adjournment was the information that the company gave you with respect to the original cost of this real estate?

A. Your questions I understood it was concerning property which I stated I found to be more valuable than the figure I had used and this figure covering property located under practically under same conditions as that of the company.

Q. That particular question, of course I remember your answer was that the property that you found was more valuable was somewhere in west Des Moines?

A. It was that piece of ground which is most nearly identical with that of the company of all of the property in the city of Des Moines.

Q. Now where was that?

A. It was on the west side of the river directly opposite the company's property and between the same tracks that Block "C" lies between.

Q. Where did you get your information about that?

A. That is Block 36 between southwest First street and southwest Second street and between Vine street and Market street, lot No. 6 in that block is the Kratzer property.

Q. Kratzer Carriage Co.?

A. Kratzer Carriage Co., and I was informed by an officer of that company that that piece of ground 66 feet by 132 feet was

1117 worth $20,000. That is $2.29 per square foot. I asked Mr. Mills, of the White Line Transfer Storage Company

what that particular lot was worth and he said it was worth $25,000 or $2.86 per square foot.

Q. Just as it stood?

A. The property with no buildings.

Q. Just as it stood?

A. I have forgotten whether there are buildings on it or not, but my price is based on the ground alone. The lot adjoining No. 6 is No. 7, the same size as No. 6, which was held by Mr. Walker of the Kratzer Carriage Co. at $15,000 or $1.72 per square foot.

Q. That is what he asked for it?

A. That is what he said it was worth. Mr. Mills said that same Lot was worth $20,000 or $2.29 per square foot. Across the alley is Lot No. 8 which the Kratzer people through Mr. Walker said was worth $15,000 and which Mr. Mills said was worth $20,000. Lot No. 9 Mr. Walker said is worth $20,000 and Mr. Mills says is worth $25,000 $2.29 and $2.86 respectively per square foot. Then I learned that the government had paid $150,000 for the post office site. That is all the information I had on that, I didn't get the area.

Q. So then you were anxious so far as the real estate examination anyhow you did make a- effort to find out something about local conditions and local valuations?

A. Oh yes, but I did not make enough of a study of it to qualify.

Q. Now did anybody tell you—I presume after you got these figures you consulted with Mr. Haines and the other managing officers here of the the gas company about these values?

A. I asked them concerning some values and asked them whether they knew of any sales in that neighborhood. I asked each of the men with whom I talked things of that kind and the general
1118 impression I got was that this property should be worth certainly at least as much as correspondingly located property in other cities which I knew to be worth a dollar a square foot as the minimum.

Q. Did any of these people tell you, the managing officers of the gas company or anybody else for that matter that values in West Des Moines were no criterion whatever as to values in East Des Moines?

A. I did not ask them as to that.

Q. Did you find out while you were making your inquiries that the values in west Des Moines were from three to twenty times as high as similarly situated property in east Des Moines?

A. I was making a study of the values of the property used by the gas company in view of its use and the next most attractive piece of ground that I could find in the study I made was this piece directly across the river and I took particular pains to find out who owned that property. I think the gas company told me who owned it, or perhaps they didn't I don't remember that. I know I went down there personally and seen Mr. Walker.

Q. Did you make any inquiry as to the holding value or selling value or selling price of property around the gas company?

A. Yes, sir.

Q. Were you furnished with the information that the property that the Letcher-Jaeger Manufacturing Company—that is not the correct name, but a manufacturing concern just east and north of the gas plant, what that sold at recently?

A. I don't remember that name, but I did go to each of the surrounding establishments and did get what I could in the way of information on real estate values from these people. Each
1119 of the surrounding industries I went to.

Q. You found it very much lower, the asking price over there than on the west side?

A. I found the asking price lower but found some asking prices more than I have used on the east side.

Q. Where?

A. I would have to get the records from my office, I just remember I found some values higher than I used on the east side of the river.

Q. And so you finally, from what information you have stated to the Master, you came to the final decision that $215,000 was a fair price is that the amount?

A. A dollar a square foot whatever the area is, is what I consider a fair price for the real estate, fair value.

Q. You figured it $215,993?

A. $1.00 a square foot is the price I put on the real estate. I have forgotten what the area is. There was $1.00 per square foot makes $196,358 and to that I have added ten per cent for the difficulty of obtaining contiguous lots at this time, $19,635. Then I have added for sinking test holes, grading and filling $5,000 more making $220,993 for the real estate, with- the addition of taxes during construction nor the loss of interest during construction.

Q. You have told now how you arrived at that value?

A. Yes, sir.

Q. Did you have anything else at all that you considered as an important element in arriving at that value than what you have already stated?

A. Nothing more than I have covered in a general way.

Q. What did the company tell you they paid for the property?

1120 A. The company didn't tell me what they paid for this property.

Q. They furnished you with figures?

A. I got from the officers of the company some records or at least some figures as to what some pieces in this neighborhood have sold for.

Q. You told me before dinner they furnished you figures, showing what this property had cost them?

A. No, I didn't mean to say that. There may be in the list they gave me a record of one or more of the pieces, the prices the present property of the gas company, but I did not receive from the company any statement showing the total cost of its real estate or the cost of each of its pieces of real estate.

Q. Didn't the company at some time earlier in the period of your

investigation furnish you an itemized list of all their property, that is all of their physical property if I may use that term?

A. Yes; they gave me this list.

Q. I hadn't quite finished the question. Or such other information with respect to its cost as they had as you understood it?

A. No, sir.

Q. I thought you stated in your examination here the other day, you did state it I am sure two or three times that in the list of property that was furnished to you that the figures furnished by the company there were several items that you did not agree with the figures

A. There were.

Q. And prices and values and that you disregarded them and took your own?

A. That is correct.

Q. That is the list that I should like to have. Have you got that with you?

1121 A. That is this list, the inventory.

Q. Is that the only list they furnished you?

A. That is. This inventory and here are some additions to it covering works tools, distribution tools and office furniture and stable equipment. These separate additions were given me later.

Q. I know, but I am getting at the list of property which was furnished you first. Not this completed book you have now because as I understand it you didn't get that until a long time after you had been at work?

A. I got first a book about the same as this but in which it was discovered some errors had been made in the calculation of the amount of brick in some of the buildings and that book was taken back and this one substituted and this is the book on which my report is based as to the dimension of buildings and characteristics of machinery and holders, etc.

Q. What else was it. Some time before dinner you remember I was inquiring about figures and the list that was furnished you by the company and you said you didn't have it here, but you would get it?

A. Yes, sir.

Q. Well that was here wasn't it?

A. That was not here.

Q. Copies of it were here?

A. No, sir.

Q. That is different from any list we have here is it?

A. This is the same as you have with the exception of some of these items we found upon going over where the number of brick were in one case figured on the wall measure and in another figured on cubic contents and where these differences have not been checked.

1122 Q. That book which you have there from which you made the valuations then is not like Exhibit No. 15 in all respects.

A. This is the book having the differences as compared with the copy of the inventory given the Master, the net result of these differ-nces being a sum of $14.00 approximately against the company.

The items are all very small and inconsequential, not enough to affect any figure that I have submitted.

Q. Then if I understand you, and this is a diversion due to that particular answer, if I understand you then after a complete checking up of both items of property and quantity of property and the figures that were made to represent items and quantities you found a difference of $14.00?

A. That is the net result of the differences, some of these differences were against the company and some were for it, but the net result was $14 against the company.

Q. The net result of a careful painstaking checking up of all these things I have mentioned finally resulted in a net difference of $14.00.

A. Yes, and I can show you what these differences are in detail if you want them.

Q. In that connection I do not quite understand your former answer in which you said you had made an over estimate in some matter of $10,000 or such a matter?

A. An over estimate?

Q. Yes.

A. What was that?

Q. Well I don't remember. Mr. Brennan suggests it.

A. I don't remember either.

Q. Didn't you say in one of your answers this forenoon or on direct examination you had originally estimated the cost of
1123 construction something like $10,000?

A. This morning?

Q. No in your direct examination.

A. If you might recall the item it was maybe I could remember.

Q. I don't remember it, Mr. Brennan called attention to it. Anyhow after a thorough and complete checking up you found the result you have just stated?

A. Yes, sir.

Q. Then if I have your testimony right in my mind *yp* to this point on this question the list of items of property, the quantity and so forth that was furnished to you by the gas company?

A. Yes, sir.

Q. And was not taken by personal examination of these items and the personal making of the inventory.

A. I did not personally make the inventory. I did personally check all of the prinsipal items.

Q. Not for the purpose of making it personally?

A. No, sir; for the purpose of seeing there was nothing in the inventory that could not be shown on the ground.

Q. And it was all furnished by the company or somebody for the company in the first instance?

A. Yes, sir.

Q. Then if I understand you you did at some time take time to at leasr make a careful and painstaking examination in so far as it was possible to be done to satisfy yourself that there had been no padding of the inventory either inadvertantly or any other way.

A. I made an examination which did satisfy me there had been no padding, but it was not made for that purpose.

Q. But you made the examination and for the purpose of satisfying your mind now as an impartial expert in engineering
1124 matters that the measurements that were furnished to you were generally correct.

A. I checked enough of the measurements to make me believe that the balance were correct.

Q. And you pursued that method as to practically every bit of this property that you placed a value on didn't you?

A. I could not follow the same method in detail on the distribution system.

Q. No, but as far as you could.

A. Yes, as far as I could.

Q. And it is your personal judgment isn't it and you are *so* willing to go on record here that the list as furnished you was correct?

A. Substantially correct yes.

Q. Now just at this point to satisfy my curiosity than to have a connected cross examination here. I wish you would turn for me to page 95, the second chart in Exhibit 20. Now if I understand this chart—you call it a chart?

A. Yes, you might call it a chart.

Q. What would be the correct term for it if there is any?

A. Probably more often call it a curve sheet.

Q. Then I will use that term, the second surve sheet as my book is pages on page 95. Now if I understand that sheet as it has been worked out here by you it purports to show the development and growth of the Des Moines Gas Company up to 1910?

A. Yes, sir.

Mr. GUERNSEY: What part of 1910.

A. The end of 1910.

Q. And it shows it in all of the plant's relation to population, mains, meters, and sales per meter and sales per mile of main
1125 and sales per capita and total sales.

A. It gives some information concerning each of these items.

Q. You exhibit the growth and development of the plant by these curve lines and represent population and years and so on by figures at the margin of the sheet?

A. Yes, sir.

Q. Now did you make that chart or that sheet after a personal examinarion of the records of the company upon which a truthful sheet showing the development and growth of the company—now I mean truth in the sense it would represent actual figures and facts—did you make it from an examination of the books and records that show these facts?

A. I didn't make any of the original cur*b*es shown leading up to 1910, up to the line showing 1910. I may say that these particular curves which were photographed to reproduce these sheets were made in my office and under my direction but they were taken from material supplied to me by the gas company. The curves beyond the line 1910 are my curves, all of the extensions.

Q. Now to get what I want before you—in order to make up a curved sheet such as this one to represent a real gas plant, one of the things that would be necessary for you to have would be the annual construction account wouldn't it?

A. No, sir.

Q. Another of the things necessary for you to have would be the annual operating expenses wouldn't it?

A. If I were making the lower curve on the third sheet I would have to have the operating expenses.

Q. There is nothing of operating expenses on the second sheet. I want to confine myself now to the second sheet. The second sheet purports to show the total sales and the sales per meter and

1126 sales per mile of main.

A. Yes, sir.

Q. Now in order to reproduce by the curve sheet method the growth of the sales of the Des Moines Gas Company from 1888 to the latter part of the year 1910, it would be necessary for you to have the gross annual sales.

A. Yes, sir.

Q. Did you have them?

A. I didn't have them as a separate statement. I didn't have the—I am not sure that I had all of the figures back to 1888, but I had them back for quite a ways, fifteen years or more I am pretty sure.

Q. How could you make a truthful representation upon a sheet of this kind by the curve sheet method of the growth of the sales of a plant covering a period of years without having the annual sales?

A. I didn't say I made the curves for years preceding 1910. I checked them with such material as I was able to get and found on every point I checked they were correct.

Q. They were made in your office were they not?

A. These particular curves which were photographed in making this sheet or any of the sheets in the these reports were made in my office, but they were copied from curves submitted to me and a great deal of the data from which curves were made I had previously in checking the curves established my own confidence in them.

Q. Do you mean you didn't make any of these sheets at all?

A. I mean I made everything on these sheets beyond the line of 1910.

Q. But nothing before 1910.

A. And that I checked the material befo-e 1910 with such data as I had and in a sufficient number of times to satisfy myself that the curves were correct.

1127 Q. Let's take sales, since this sheet was made by somebody else, and therefore if you testify about it at all, it must be upon the correctness of your checking. Now you are going to check the total sales say from 1880 to 1891 because that seems to be about the point where there is a substantial rise in the line.

A. You are looking at the population line?

Q. I want the sales line, that begins with 1880 doesn't it?

A. 1888.

Q. Begins at 1888?

A. Yes, sir.

Q. I suppose in order to check this you had the gas company's statement of their gross sales for the year- 1889, 1890 and 1891.

A. Yes, I believe I did.

Q. Do you still have those?

A. I believe so.

Q. Then to check further you of course had the statement *ff* the company showing their annual sales for 1891, 1892, '93 and '94 did you not?

A. I believe so.

Q. Then it is true isn't it, that you had the company's statement of the annual sales for each of the years from 1888 down to 1910?

A. I am not sure I had them back as far as 1888. I am not sure how far back they did go, but it seems to me I did have them back to 1888.

Q. Where is this material?

A. Chicago.

Q. Didn't you consider that as an important part of your exhibit here No. 20 that you produce as being the result?

A. No. I considered that as matter that might easily be proven on the ground at any time.

Q. But suppose what we should develop on the ground was
1128 not w*ah*t you had. Then would it be important to have it here?

A. Not at all in this respect because this curve back here is no portion of the curve that is used in determining the extension. These lower portions of the curve are not portions used *in* determining extensions. What we need for extensions is a history say of the last ten years.

Q. Well did you have the figures for ten years?

A. Yes, sir.

Q. Will you produce them too?

A. I can get them from Chicago I believe.

Q. The figures you used are what we want. You will have those brought in will you?

A. If I can locate them yes.

Q. I don't know just what you mean, if you can locate them. You don't mean that they have been destroyed at all do you?

A. They are in Chicago in my files, but I don't know whether I can get my stenographer or either of the men in the office to find them, whether they can know exactly what they are getting or what I want or not, but I believe they can.

Q. I suppose it would be equally within the truth for me to say that in your office you regard it as highly important to preserve all of the memorandum or figures and facts upon which you base this kind of a report do you not?

A. Yes, sir.

Q. And they are all properly filed and preserved?

A. There is an attempt made always to properly file them but

they are not always properly filed, we slip up on some of these things, get them in the wrong place.

Q. Do you think you slipped up on any of this, is that what you have in mind?

1129 A. No, I don't thi-k so.

Q. So you didn't being with you and haven't with you now the memorandum that would have to be used to check the correctness of the matter that appears in this Exhibit 20?

A. Not of the matter back of the line *on* the year 1910. All of the matter from which the curves following the year 1910 are made will be found in my report.

Q. All of the matter following 1910 is speculative is it not?

A. It is speculative but based on history.

Q. There are no facts or figures anywhere except as you take them from your mind upon which any of the information in Exhibit 20 after 1910 was made.

A. There certainly are no facts on future developments.

Q. That is all purely speculative. The memorandum back of 1910 none of it is here as I understand you.

A. I presume all of it is in the office of the companny but I don't know that.

Q. What you used yourself, I am not talking about what may be found in the company office, but what you had.

A. No, what I used is not here.

Q. None of it?

A. No.

Q. I wish you would see it is all forwarded here, the memorandum you used in preparing Exhibit 20. Now going to the next page which is paged in my book as 96, and is a curve sheet I suppose the same name applies to it that applies to the other?

A. Yes, sir.

Q. Now I notice on this curved sheet among other things gross revenue beginning somewhere at a point near midway between the year- 1886 and 1887 and proceeding by years with an upward

1130 tendency on your curve line until it strikes or intersects the line upon the margin of which is found the year 1910?

A. Yes, sir.

Q. Now that is supposed to represent—that line between these points was intended by you to represent to the Master and counsel here the actual annual gross revenue of the Des Moines Company, isn't it?

A. Yes, sir; as applied to the city of Des Moines.

Q. *Q*ell the Des Moines Gas Co. don't have a gas plant anywhere else do they?

A. I understand they supply gas in Valley Junction.

Q. When you say applied to Des Moines you simply mean you do not take in Valley Junction, that is what you mean?

A. Yes, sir.

Q. Who made this curve sheet?

A. It was prepared from the record of the company by some of the company's engineers, I don't know which ones.

Q. Some of what company's?
A. Des Moines Gas Co. And I likewise checked these curves with information given me.
Q. Where was this made do you know?
A. You mean the original curve I presume?
Q. Yes, I mean the original curve?
A. I believe it was made in Des Moines.
Q. Or was it made in Philadelphia?
A. I don't know.
Q. I have got a wrong impression of your original testimony. These curve sheets are not yours?
A. Only as I have said repeatedly the extensions beyond the year 1910. The historical matter is obviously not mine, it
1131 is from the records of the company.
Q. You didn't make them from 1910 did you, you simply furnished the information for somebody else.
A. I didn't make the marks myself, but I had men in the office who made them, I gave them the figures and they made them. Figures upon which these various dots were to be located and then a line run from them.
Q. Let's see if I get this right. Of course this sheet was not prepared by any person until after all of the necessary basic facts and information had been gathered up?
A. No, sir.
Q. You made up the information that was to be used beginning with the end of the year 1910?
A. Yes, sir.
Q. That is the beginning of 1910 here as it appears on this chart where the figures 1910 are is the beginning of your work, that is what I speak of rather than 1910?
A. Yes, but it represents the end of the year 1910.
Q. The information you got begins on this curve?
A. Yes, begins on the 1910 line.
Q. That information you m-de up?
A. Yes, sir.
Q. Then the information with reference to all of these lines back of the year 1910, using the word back in connection with the sheet itself, was prepared by somebody else?
A. Yes, those curves are the result of figures taken from the -ecords of the company.
Q. Now what I want to get at is this. This Exhibit 20, the business of making this up was turned over to you was it not, I don't mean the mechanical work.

—. ——.

1132 Q. Putting it together and making the report.
A. My work covered the making of the report in which it was incidentally that I should include some of the detail. I have not included all of the detail of the inventory for instance.
Q. In other words we are not to understand are we that one part of this Exhibit 2- is your report and part is somebody else's?
A. You are to understand that wha-ver appears in this report is

what I believe to be correct after my own investigation and calculation, but obviously what is taken from the records of the company I cannot say is my own work.

Q. Either you don't understand me Mr. Lea, or we don't get along very fast. Here are some sheets, curve sheets made up by somebody and cresented here by you for the purpose of being used by the Master in this case and from which inferences may be drawn and conclusions reached. You presented them.

A. Yes, sir.

Q. Now I want to know how much you had to do with this Exhibit 20 in its preparation, whether you had the entire supervision of it or whether you just made part of it and somebody else made part of it and you finally at the end concluded it was right and presented it as your report?

A. It is in every sense my report but the material from which the curves shown on these *plates* were made comes to me just exactly as blue prints describing a building company and I used them in that same way. They are not my curves any more than blue prints are my blue prints but they represent what is there and from that I build on these following years.

Q. Whose plan is this that appears on these three sheets, yours or some engineer's?

A. This was made in my office.

1133 Q. No, that is not the question. Now whose plan is it to work this out, who proposed having this sort of a representation made here in the first place?

A. I don't know whether anybody else proposed having anything else like this in his report or not. I know — proposed putting it into my report.

Q. Then you originated it?

A. Certainly.

Q. It originated with you so far as this lawsuit is concerned?

A. Certainly.

Q. If that is true then you did have furnished you by this gas company a statement of the annual gross sales of the company beginning with the year or about the year between 1886 and '87 up to the year 1910?

A. I am not sure that the figures I have of gross revenue run back to 1887. I am sure that they run back far enough to satisfy me as to the accuracy of the curves during the past ten years and that was all I wanted in making my extensions.

Q. That is to say if you just had the material or figures that cover any ten year period——

A. On such an item as gross revenue.

Q. On such an item as gross revenue you would then through some percentage method be able to continue a showing up to the point you wanted carried out whether you had the real figures or not.

A. Not if all I had was gross revenue figures. I would want additional figures.

Q. But you would want gross revenue figures?

A. If I gave my gross revenue on such items I would want for the past ten years I would be perfectly safe in making my estimates of next succeeding several years.

1134 Q. What would be some of these other things you would want in addition in order to make up these three curve sheets so that they would represent the true development and growth of this plant. You would want the annual extension of mains with the annual cost or expenditure for mains would you not?

A. No, sir.

Q. And you would also want the annual per capita information upon which you could figure out per capita sales?

A. Would want information on which you could figure per capita sales yes.

Q. But you would not need mains?

A. I would not need to know the number of feet of each kind and size of main laid each year.

Q. Would you want any information about the mains or what was done about them?

A. I would not need for example some of the figures which are not of the greatest importance here for instance, revenue per mile of main. That is not really an important figure.

Q. Well but it is here?

A. It is here.

Q. You have undertaken to figure it out for me?

A. Yes, sir.

Q. How could you do that without knowing all about it?

A. You don't need to know all about the mains, all you need to know is the total mines of mains in use at the end of any year. That information I have.

Q. Does that simply state the number of miles of mai- without anything in the way of discriminating between large or small?

A. It does.

Q. Was that information furnished you by the company?

1135 A. It was.

Q. Before these sheets were made up?

A. It was furnished to me before I checked these curves. I don't remember whether the information was given to me before I saw the curves or not. It was certainly made up or compiled before the curve was made because the curve could only be made from such data.

Q. Don't the development and growth of an industry of this kind depend to some extent on the net annual income of the company?

A. Does growth depend on the net annual income?

Q. Yes.

A. In what way?

Q. Every way. Could it grow if it did not have a net annual income?

A. I am afraid you will have to try that again, I don't get it.

Q. That is too cloudy for you?

A. Yes that is too cloudy.

Q. Well does it cut any figure at all in making up a sheet of this kind where you are attempting to show the growth and development of a manufacturing plant as to what the net annual receipts of the company out of the business are?

A. This does not purport to show the net annual receipts.

Q. I didn't ask you that. (Question read)

A. That is not one of the things considered or shown here.

Q. (Question read)

A. No, it is not necessary.

Q. Now beginning with the line on page 96, that is the second sheet where the year 1910 appears on each of these sheets, I want to ask you if you made them up on the theory of dollar gas?

A. You are speaking now of the second chart?

Q. All three of them.

1136 A. Well some of the figures on these charts were made while gas was being sold at a dollar net. The charts show which years I think.

Q. Well tell us.

A. The third chart shows that the price of gas in Des Moines went to a dollar.

Q. (Question read)

A. Not on the theory but on the fact of dollar gas.

Q. That is from 1910 to 1918?

A. Yes; from 1910 to 1918 I naturally worked on the theory the price would be a dollar or assumption. 1910 is on the fact of dollar gas.

Q. Now you stated as I remember it that these charts would work out or show about a 40 per cent increase in the growth and development of this company as measured by these items which you show on here from 1910 to 1918.

A. Approximately.

Q. Now will you figure out for the master what it would be at say 90 cent gas?

A. What what would be at 90 cents? What do you want to know?

Q. I want to know where these lines would probably strike if gas were sold at 90 cents?

A. The line showing gas sales you mean?

Q. This line showing gross sales and the line showing total revenue?

A. I can figure it out to show what I believe to be the result.

COURT: How long will it take to do that?

A. About three hours.

Q. Is it necessary to take three hours?

A. Yes, sir.

Q. You can figure out the sales within these years within a

1137 minute or two?

A. What time?

Q. Within these years, what the sales would be at 90 cents instead of the figure here?

A. No I can't figure that in a few minutes.

Q How long will it take approximately?

A. I haven't got the figures on it, to figure the changes of all things entering into the price change?

Q. Consider all the things there that affects the rise of gas.

A. It will take a great deal of time to get it for you if you want to know.

Q. Take three hours to get the sales?

A. I believe so and have it in such shape as I could testify to it.

Q. This is part of the information from all this memorandum and you work out this curve sheet from 1910 to 1918 yourself.

A. Yes, sir.

Q. And it would take you three hours to tell us from your own sheet.

A. To tell you in a way I want it to appear in the record to stand on.

Q. To take your own method of approximating what the difference would be in 90 cent gas and dollar gas?

A. Yes, sir.

Q. All right you figure that out for us any time you will and have it for us tomorrow and we will be obliged to you if the Master does not want to stop now and have it figured out.

COURT: No it consumes too much time.

A. In figuring this 90 cent consumption you want to begin at the end of the year 1910 as I understand it. Assume that the price went into effect at the end of 1910?

Q. Yes, January 1, 1911.

1138 A. Yes, sir.

Q. Now Mr. Lea Mr. Brennan has called my attention here to your statement of over estimate and it is as he suggested, it is on page 772 of the transcript?

A. In connection with the working capital.

Q. Yes. You stated there, those figures as to working capital with the one exception of the item of $142,000 which I used instead of the $141,770, I obtained from the company. I had made my own estimate of the amount of working capital required in a case like this and had arrived at $160,000 but when the company's books were shown me I found I was too high and I put it back to exactly what I have here. Then you did examine the company's books for the purpose of ascertaining whatever facts were necessary for you to know to begin your work of fixing the value of this property?

A. I did on some such things as this for instance. That is the only thing like this of course. Here is money which has no appreciation or depreciation and is fixed by the books of the company and nothing else.

Q. Do you mean to have us understand here that you are testifying that from an examination of the company's books you found that it actually had a working capital of $150,000?

A. I am testifying the records of the company shown to me contain those amounts.

Q. That is not the question. (Question read)

A. Yes, sir. That is $150,000 after you have substracted the ad-

ditions I charged there in the taxes during construction and loss of interest during construction, and the difference between $142,000 and $141,770.

Q. Then if I understand you now, you are testifying that from an examination of the company's books you found aside from
1139 interest and taxes that it had an actual working capital of $141,000.

A. I am not testifying that the gas sales for instance, the gas sales item was obtained by me through study of the ledgers and addition of the individual items outstanding on that account. The summary which I have shown here is a copy of the summary which I received from the company and which I have reason to believe is correct.

Q. Why did you change your estimate?

A. Because on a question like working capital the money actually used is subject to neither appreciation or depreciation if you can get the actual figures they are what the actual present value is obviously, the present requirements.

Q. You had then got the actual figures?

A. Really I considered it was the actual figure that should be used.

Q. And it showed the working capital aside from these items interest and taxes you have referred to of $141,000?

A. Yes, sir.

Q. So you changed your figures from $160,000 to $150,000?

A. Yes, sir.

Q. That is the reason you did it?

A. Yes, sir.

Q. Now this morning, Mr. Lea, you said in explaining your hypothetical p-ant theory that the town in which your hypothetical plant is to operate would be piped, that is that piping to the houses and in the houses would be there, you assumed it was all there?

A. Yes, sir.

Q. Now why didn't you assume too that the gas fixtures, stoves and heaters were all there?

A. Because these are ordinarily put in by the gas company.

Q. But the gas fixtures are owned by the consumer?
1140 A. Yes sir.

Q. Gas stoves are owned by the consumer?

A. Usually they are but the work involved installing -hem, selling them putting them up and connecting them is ordinarily done by the company

Q. The consumer buys those things where he pleases?

A. He does but ordinarily he buys them from the company.

Q. Is that true?

A. That certainly is true.

Q. Where do you know of another gas company that is operating a retail gas fixture store such as they are here?

A. I don't know of any gas company that does not sell retail fixtures.

Q. I know they may have them——

A. And they sell them and they connect them up.
Q. Is that the only place that consumers get them?
A. Certainly not.
Q. So that a consumer owns the gas fixtures?
A. Yes, sir.
Q. In 95 out of 100 cases?
A. I presume they own them in a hundred out of a hundred cases.
Q. The consumer owns the heaters and stoves?
A. Yes, sir.
Q. And buys them where he pleases?
A. Certainly but ordinarily he buys them from the company because the company sells them for less than other people will sell them.
Q. You know that?
A. I know that.
Q. Did you make any inquiry here as to how gas fixtures sold?
A. No, I am saying ordinarily that is the case.
1141 Q. You have to find out ordinarily by inquiry for specific cases?
A. I don't know whether in this particular time the plumbers sell stoves or not.
Q. You really don't know anything about the local situation regarding the sale of stoves?
A. Not in that -espect no sir.
Q. I did ask you Mr. Lea and I want you to rep*ate* so there will be no misunderstanding about it to supply for us at the next session if you can or at as early a time as you can the tables and figures and lists from which you made up these diagrams and curved sheets and other memorandum here that works out this going plant up to the latter end of the year 1910. Now in Exhibit "I" at page- 90 and 91 will you please give me the amount that you have allowed for paving over street mains and services, it is Exhibit "I" of Exhibit 20?
A. These items are shown separately for mains and services.
Q. Just give me the total amount as you have them figured?
A. The total net construction cost of tearing up and replacing pavement over mains and services in use the 1st of January 1911, is $330,558. This is shown by my report.
Q. That is to say now if it should be determined or if it should so happen that within the next few weeks or months all of the present mains that are beneath paved streets as you describe them in your report should be found to be work out and it should become necessary to lay them now it would cost $330,558 to go through the pavement.
A. To tear up and replace existing pavement over existing mains and services, yes.
Q. Now that as I understand you, would be simply the cost of the labor and material in taking pavement up and replacing
1142 it after the pipes were laid?
A. That represents the net construction cost which is the cost of labor and material of taking up and replacing these pave-

ments after having credited to such cost the material recovered from the old pavement when it is taken up in such cases as it is possible to us- the old material over.

Q. Now to make it free from any complications of that kind——

A. It is the net construction cost.

Q. The net construction cost is $330,558?

A. Yes, sir.

Q. In arriving at that figure of course and in giving these figures at all in your report you have assumed that these pipes will be laid under the pavement that is between the curb lines?

A. Where they are so laid now.

Q. Is there any reason why they could not be laid between the curb and the parking?

A. There is so far as this calculation goes because we are reproducing the existing property, not some other property.

Q. Reproducing it exactly the same place?

A. As it is today.

Q. Whether it is the most economical place?

A. Certainly.

Q. I thought you were starting out to make a plant here that would be built upon the most economic plan and of the highest efficiency which could be built?

A. If you read my testimony you find I start out to build a plant as quickly and efficiently as possible and exactly of this type size and characteristics.

Q. You could lay these mains a great deal quicker by putting them und- a part of the street where there were no pavements?

1143 A. But I have no right to figure on reproducing anything except what is here.

Q. Do you build the identical plant, is that the theory?

A. Certainly.

Q. Put your pipes at the most expensive place?

A. No, I put them where they are.

Q. Why do you do that?

A. To reproduce the system where it is.

Q. You are making a new system.

A. It is a duplicate of this.

Q. A duplicate of this in everything except earnings?

A. Everything except what?

Q. Earnings?

A. And it will be a duplicate of earnings if you follow the calculation up there to 1918.

Q. Any way you don't take into consideration the fact that these mains could be laid just as well outside of the curbs as between them?

A. Certainly I consider that just as I have considered that a plant of this capacity which would be possibly built today in view of the modern developments, it would be possible to build a plant having the capacity of this one at less money than this one cost.

Q. That is important, I am glad to have that suggestion. As an expert on gas and you present yourself here as one, you don't want to be understood as saying that these gas mains cannot be just as

serviceable and laid with much less expense and trouble outside of the curbing than they can in the street between the curb.

A. I don't say that.

Q. It is a fact isn't it that they can be laid for much less money?

A. It is a fact sometimes they can be so laid for much less money.

1144 Q. In your hypothetical plat and in your estimate of values of the so-called going plant if I understand you now, you proceeded upon the theory that both your going plant and your hypothetical plant were constructed upon exactly the same lines and in the same way no matter what changes or modern methods might have come in since the organization of your going plant, is that your idea?

A. I made this calculation with the view of determining the present value of the existing property on a reproduction basis which precludes the taking of the reproduction cost of some other kind of property.

Q. (Question read.)

A. In my conclusions covering the hypothetical plant I assume the reproduction of the property as it is.

Q. You can answer that question by yes or no.

Mr. GUERNSEY: He has answered it completely and concisely.

Mr. BYERS: That is your judgment but it is not mine. I prefer to have an answer to the question with the qualification the witness puts on the answer.

COURT: I do not consider that he has answered the question.

Mr. GUERNSEY: I object to the witness being required — just yes or no, because the question carries with it an assumption that there is out of date old fashioned stuff here and the witness by answ-ring yes or no would be compelled to admit that assumption which he should not be required to do, but he ought to be permitted to answer and tell just what he did.

Mr. BYERS: This question simply goes as to whether he proceeded as I asked him, that can be answered yes or no.

COURT: If you can answer yes or no do so.

A. I can't answer yes or no.

Q. If you were building a new plant in Des Moines for the
1145 purpose of serving the gas consumers of this city, in other words, if you had been employed to furnish plans and specifications for a new gas plant with your estimates of cost, would you have furnished to your employer the plans and specifications and figures that you set out here in your hypothetical plant?

A. Do you mean if I had to design a plant to supply the present demand in the city of Des Moines?

Q. The present and the future demands?

A. No, I would not.

Q. Then if I understand you, you don't pretend now or claim that this hypothetical plant that you have worked out here on paper would be the kind of a plant that ought to be construct- and operated to serve the people of Des Moines?

A. To answer that I would have to say first that all gas plants as

old as this have passed through several periods of necessary extensions and there comes a time when they contain units which are not of the size which would best be installed at a later date. If I were desig-ing today a plant to supply the city of Des Moines for instance I would not put in a six foot six water gas sets. Now there are two such sets here. I would put in larger sets. These sets today have a value but they have not the value in their producing capacity as larger units would have. On such items as that the plant which I would design would differ from this. I would have for instance instead of one three hundred thousand foot holder and a million foot holder both for storage I would have one of more than a million and which would be more effective than the two. The million foot holder now in this plan is the natural result of the growth of the plant but if it had been installed at the time of the building of the 300,000 it would have been an unwarranted expense in the maintenance of the property and the price of gas would neces-
1145 sarily have been affected.

Q. Then if I understand you, you do not consider the present plant of the Des Moines Gas Co. as it is now organized as a proper and economic plant for the furnishing of gas in Des Moines at this time and for the future?

A. I don't believe it is quite as economic as a new plant built for this capacity would be.

Q. Now which plant would be the most expensive, or let me put it a little different way. Which of these two plants now, your so-called hypothetical plant that you have worked out or the plant you think we ought to have here would cost the most money?

A. I have made no estimates on the——

Q. Oh, well you can give us that in a general way?

A. No, sir.

Q. You won't even venture a guess?

A. I will not without calculation.

Q. If you come within a million dollars we will be satisfied.

A. No, I can't give any answers on that.

Q. Can't you give the slightest opinion?

A. No, sir. I want to figure these things, I don't want to guess at them.

Q. How long would it take you to figure that out in your mind.

A. Oh I might get it for you in a day or so.

Q. You would have to get some figures you haven't here?

A. I have a lot of records in my bag which I would use.

Q. You can't even approximate what the proper gas plant would be worth as compared with the hypothetical plant?

A. No, sir; I have not even laid the thing out in my mind, I don't know what I would put in.

1147 Q. Then we reach this point don't we that the only purpose you had in your mind when you worked out this so called hypothetical plant and the express purpose for which it was worked out was simply to get at this so called going value that you have estimated at over $600,000?

A. No, sir.

Q. What other purpose.

A. Well the purpose of figuring on the property as it stands so that I might obtain a reproduction value of the property as it stands, not on some other property. You are not valuing the hypothetical plant, valuing the actual plant.

Q. You have given the reproduction value of this going plant. Now what was the purpose of having this hypothetical plant worked out when you already had the reproduction?

A. Perhaps you misunderstand. I have not made two calculations of reproduction value. The reproduction value made of the going plant is the same as used in the going value calculation. There is no separate calculation for the hypothetical plant.

Q. Aside from this one item of going value when you had worked out your reproduction value of the going plant, you could have stopped so far as your report was concerned?

A. Without any allowance for going value you mean?

Q. Yes.

A. Why certainly not. The going value is an attribute of the physical property.

Q. The way you got at it so far as your report is concerned is by working out this hypothetical plant and figuring out a per centage of expenses and cost and growth and making certain credits which you figure out and the so called returns or earnings from the hypothetical plant and the going plant and the difference between
1148 the two finally makes your going value.

A. The reason I used this calculation is that it is the only method I know of for specifically arriving at the accurate amount of going value.

Q. Yes, you told us that this morning several times. We will go back to these figures for paving. That was $330,558. Now does that cover any streets in which the pavement was down before the mains were laid?

A. I presume it covers some, I don't know about that.

COURT: You give $330,558 for tearing up pavements and laying mains including the services, where do you get that?

A. The grand total given here is $277,574 for mains and then you add to that the total net construction cost of house services plus lamp post services and it will give the figure I gave you.

—. There was no trouble to you to ascertain whether or not any of these streets that are included in these figures were paved before the pipes were laid was there?

A. Would not have been any great amount of trouble I presume.

Q. You proceeded on the theory that they were not, that is that these pavements were laid substantially all of them after the pipes were originally put down?

A. I did not. I went on the theory that it was of absolutely no consequence so far as my calculations are concerned whether these pavements were laid before or after the laying of the main.

Q. Can you give us any idea how many were laid before or after?

A. I don't know.

COURT: If I understand you correctly you made your calculation as though the streets were in the condition they were on the 1st day of January?

1149 A. As to paving and the reason back of it was this——

COURT: I understand the reason. I only wanted to know what the fact was?

A. Yes, I took the streets which were paved the 1st of January in which were gas mains and services and have estimated what in my opinion would be the net construction cost of tearing up and replacing the pavement in so far as it would be necessary in reproducing these mains and services.

Q. Now another word or two about the pavements. Do you know about the condition of the alleys that run parallel to these streets that are now paved and for which you have figured the cost of tearing up and replacing?

A. No, I don't know anything in particular about them, I have seen a lot of them but I have not examined them.

Q. Any reason you know of why the mains could not be in the alleys.

A. I know cities that are using it where the cost to run mains in the alleys will be more expensive than running them in the street except where paving is expensive.

Q. Why?

A. Because the risers ordinarily are in the front of the building and you have got to run that much additional if you run from the back in addition to running through the back yard.

Q. That all depends on the character of the building and the occupancy?

A. I have not considered replacing the alleys because they are not in the alleys.

Q. If the Des Moines Gas Co. were required in the carrying on of its business to lay down a main between 7th and 8th street here on Wanut street and that work should be carried on say this week the pavement torn up, the ditch dug and the main laid and

1150 the pavement replaced, all of your expense, so far as the pavement is concerned, and so far as labor is concerned and cost of new material, if any had to be used in the pavement all of that is charged to operating expenses is it not?

A. Certainly not.

Q. What part of it is not?

A. None of it.

Q. What is it charged to, the construction expense?

A. The new work charged to construction.

Q. Suppose it is repair work, where did it go?

A. If repair work charged to repairs.

Q. Finally what general account is repair work?

A. Such portion of the work as is repairs goes to repair account.

Q. In making up the balance sheet for the year don't all of these items go into the operating expenses of the plant?

A. Either as maintenance or as depreciation.

Q. And they all enter into the item of operating expenses when the balance sheet is struck?

A. None of this portion of the cost referring to new construction do.

Q. I am talking about repairs now.

A. Yes, all repairs go in either as maintenance or as depreciation.

Q. New construction like expending a line into some new territory, where is the cost of that carried to on the books of the company?

A. Capital.

COURT: Suppose they have to relay one pipe.

A. Have to take up a four inch and replace it with an eight inch?

COURT: No replace it with the same kind?

A. Then you would have to replace a four inch pipe be-
1151 cause it was worn out or something like that. If you take up one pipe and replace it with another pipe the same size and kind all of the cost of the new pipe plus cost of taking out the old pipe and putting in the new pipe, minus what you may recover from the old pipe if anything, is a legitimate charge against repairs or depreciation. It would go into one account or the other.

Q. That is part of the general item of operating expenses?

A. Whether it goes to repairs maintenance or depreciation it gets back into operation ultimately.

Q. In your Exhibit "E" of Exhibit 20 at page 13, you give the cost of the construction of the distribution system including paving as $1,549,871 do you not?

A. Yes, sir.

Q. Now if you deduct—I wish you would work that out for me if you will—if you deduct the paving from your distribution system as you make it, and give me then the value now as you figure it out of the distribution system without paving.

A. Well I can't arrive at the reproduction value of the distribution system without including paving.

Q. I want to get at it without paving, take that amount of paving out?

A. If I subtract $330,558 from $1,549,871 you will obtain $1,219,313.

Q. That would represent the amount now that you have carried into your figures showing the value of the distribution system less the $330,558 for paving.

A. I have carried the figure in for paving because paving is a legitimate part of the cost.

Q. I say if you take the paving out that is what the fig-
1152 ures would show with paving out, $1,219,213.

A. That would not be the reproduction cost of the distribution system.

Q. What would it be?

A. It would be the reproduction cost of the distribution system minus $330,558.

Q. What would the remainder be?

A. I don't know. I- would not be the reproduction of the distribution system, net construction cost.

COURT: Would it not be the reproduction if there were no pavements in the city?

A If no pavements in the city of Des Moines at all at the 1st of January, that might then represent the reproduction cost of the distribution system.

Q. Now then on this same page 13, of Exhibit "E" you find the cost only now without overhead charges real estate, $215,993. That is correct isn't it?

A. Yes, sir.

Q. Buildings $85,723. That is correct.

A. $85,723 correct yes.

Q. Works equipment, $420,428. That is correct?

A. Yes, sir.

Q. And distribution $1,549,871. That is correct?

A. Those are the net construction costs I have shown in my report.

Q. These figures are correct according to your judgment?

A. Yes, sir.

Q. Now if you add to these figures your item of working capital $150,896 you would get a total of $2,422,911 would you not?

A. I have not added it.

Q. Will you please do so so as to verify my statement
1153 about it?

A. These two figures added make $2,422,911.

Q. Now that represents does it not your estimate of the cost of duplication of this plant today without overhead charges?

A. You can't duplicate without overhead charges,

Q. I know you can't but I am getting at these figures, they would represent the amount you have worked out that it would cost to duplicate this plant less the overhead charges.

A. These figures $2,422,911 are only the total of the sum of the net construction cost plus working capital used in my report.

Q. And less overhead charges?

A. Only what I said.

Q. If you take from that total the $330,558 which you have allowed for paving you would have the sum of $2,092,353, would you not?

A. You would.

Q. As your value when new without paving or overhead charges?

A. Certainly not.

Q. Certainly not. Well why not.

A. You can't value the property of a gas company having the characteristics of the Des Moines Gas Company without including going value because it is an attribute of the physical equipment.

Q. I am not asking you to testify now with respect to going value.

A. You are asking me to state what is the value of the property without going value.

Q. You misunderstood me, I don't blame you much for that, because perhaps I have not used the right term but I think you know

what I am trying to get at. I am taking your own figures just as you gave them in court.

A. I am willing to stand on them.

Q. I may not be entirely clear, in the method I am trying
1154 to work this out, but I am trying to get at — so I will understand it as well as you do if I can. I take your figure of $215,993 for real estate without any of these overhead charges, the buildings $83,723, works equipment, $420,428 the distribution system $1,549,871 and your working capital $15,896, now these figures are correct are they not?

A. They are.

Q. They appear in your report?

A. Yes, sir.

Q. And they represent your value?

A. They do not represent the value.

Q. They represent the reproduction cost, you are playing on the word value.

A. No, not playing on it, it has a direct meaning.

Q. They represent the reproduction cost of these items read to you making a total of $2,422,911. Is that right?

A. The addition of the net construction cost to the working capital used in my report makes a total of $2,442,911.

Q. If you deduct from $2,422,911 the reconstruction cost of paving $330,558, you will have remaining as the reconstruction cost less the pavement $2,092,353.

A. No, sir.

Q. How much would you have left?

A. I would have to figure it out to see. I can't arrive at it from these figures.

Q. Well take $330,558 from $2,422,911 and what would you have?

A. I am not disputing the substraction at all. The figure you have stated is the result of the substraction of $330,558 from the $2,422,911.

Q. What does that represent?

1155 A. I don't know how to express it. Certainly has nothing to do with the present value of the property.

Q. Don't it represent the figures that work out from your report that would represent the reproduction cost less the paving?

A. No, sir.

Q. And these items that I have read to you, real estate, buildings works equipment, distribution and working capital?

A. All right now then, you are specifying the items. I am talking about the plant.

Q. That is your opinion of the right way?

A. That is not the right way.

W. Well take then your way?

A. What is the figure you want arrived at?

Q. I want to arrive at the remainder of these items I have read to you after taking paving out as you have figured it in your report.

A. That is not clear to me.

Q. Give me the figures shown as you work it out in your report of the reproduction cost of this property less paving and overhead charges, what is the amount?

A. I can't give that to you without a lot of calculation because that is a sort of item that is not carried through separately arrived at through taxes during construction and loss of interest during construction, it would have to be separately calculated to get that.

Q. What does $215,993 represent with respect to the real estate?

A. $215,993?

Q. Yes what does that represent?

A. That is net construction cost of real estate.

Q. All right now, we have got net construction cost of real
1156 estate.

Q. Now what does building $85,723, what does that represent?

A. That is the total net construction cost of buildings.

Q. That is net construction cost of buildings, all right that is $85,723. Now the item works equipment $420,428 what does that represent?

A. That is the summary of the net construction cost of works equipment.

Q. Now what does the item distribution, $1,549,871 represent?

A. That is the net construction cost of the items entering into distribution system.

Q. I wish you would put that item down also. The item $150,896 what does that represent?

A. Total working capital.

Q. Now will you please give the Master the sum total of those several items?

A. $2,412,911.

Q. You have made a mistake have you not of $10,000, $2,422,911?

A. $2,412,911, is what I get.

COURT: That would be the new plant throughout?

A. No, sir; that would be only the net construction cost plus working capital.

COURT: That is the new plant.

A. That is only part of the cost of course.

COURT: I am asking if that net construction cost would be a new plant?

A. Oh yes.

Q. Now will you please let me check up the items with you there?

A. $205,933 for real estate.

Q. No, $215,993. Now what is your total?

A. $2,422,911.

1157 Q. Now what does that represent?

A. That represents the total of the net construction cost of physical equipment alone plus working capital.

Q. Now then how much if anything is included in those figures for paving?

A. The sum we had before here.

Q. What was that?

A. $330,558.

Q. Now if you will please, deduct that from the other sum and tell us how much is left?

A. $2,092,353.

Q. Now what do these figures represent?

A. The total net construction cost of physical equipment alone plus working capital less net construction cost of paving alone?

Q. Now if you will turn to your letter to Mr. Haines on the introductory of Exhibit 20 and note down there and give to the Master the total cost new of the plant with all overhead charges and paving and going value?

A. That is you want the total reproduction cost?

Q. Yes, the total reproduction cost including all these items you work into it.

A. You don't mean that to be parallel do you to what you are getting here?

Q. No, just give me the amount there.

A. $3,641,714.

Q. That is your estimate of the reproduction cost with all of these overhead charges, paving and going value included.

A. Yes, sir.

Q. Now will you please deduct your value when new without paving or overhead charges from that item, the $2,092,253 from your—That is no such item———

1158 Q. Well deduct that item?

A. Can't do it, no sense in that.

Q. Deduct it from your total in your introductory letter to Mr. Haines and tell me what you have left?

A. Subtracting from $3,641,714 the sum of $2,092,353 leaves the sum of $1,549,361.

Q. That would represent would it not, that $1,549,461 would represent your estimate of the reproduction cost of this property—leaving out the paving—would represent the reproduction value including paving would it not?

A. No, sir.

Q. What would it represent.

A. I don't know sir. It represents nothing in my opinion.

Q. It don't represent anything.

A. Not in my opinion. It is not a fair method in arriving at anything.

Q. We had an item of $2,092,353 on your paper. Now what did it represent when you had it there?

A. That represents the total of net construction costs of physical equipment alone plus working capital minus net construction cost of paving alone.

Q. Now if you take that sum representing these items from your total what do you have left and what does it represent?

A. I don't know.

Q. Have you figures it to see?

A. I have figured it right here.

Q. What do you have left?

A. I don't know as to what the dollars are, I don't know what they mean. They mean nothing to me.

1159 Q. Well let's see if I can't brighten you up a little on that. How much does your report show you allowed for paving?

A. A net construction cost of $330,558.

Q. Put that down please?

A. I have it.

Q. How much do you allow for going value?

A. $583,000.

Q. How much did you include in these overhead charges?

A. I have not separated them.

Q. I wish you would do so?

A. Let me see if I understand the question.

Q. What I asked you is the amount that you have included into this general sum that is contained in your letter to Mr. Haines in what might be termed intangible values over and above the item of paving which you have already given as $33,558.

A. I understood you asked for the overhead covering loss of interest during construction and taxes during construction.

Q. Here is what I mean exactly, you have already given me the sum of $2,092,353 as the reproduction cost.

A. That is your figure, that is not mine.

Q. I got them from your figures, you figured them out yourself. Now there are three items, paving, and going value, these two you have given me, $583,000 and the paving you have given me. Now I want to know what is the sum total of all of the other items that you have included in this grand total here over and above the $2,092,333, call it overcharges or whatever you please, but what is that total?

A. I don't call it over charges.

Q. Overhead charges.

A. That is what I am working on now.

1160 Q. Do you have to go back through the book to find out?

A. Yes, sir.

Q. The only way you can do it?

A. Yes, sir.

Q. I think we can shorten this up, if you will take $2,092,353 add the paving $330,558 add your going value $583,000 and give us the sum total?

A. $3,005,911.

Q. Now if you will subtract that sum from the grand total which you gave Mr. Haines you will get the item I want which includes everything else which I term overhead charges?

A. You understand I am not telling you what this figure represents.

Q. I want you to answer the questions, I don't care what you tell me so that you tell me the truth.

A. Subtracting from $3,641,714 the sum of $3,005,911, gives you $635,803.

Q. Now then if you will take these three items I started to give you a little while ago, the paving?

A. $330,558.

Q. Now the going value?

A. $583,000.

Q. Now the balance between the grand total, $635,803, add those items together and tell me what you have?

A. I have the sum of $1,549,361.

Q. Now from your report, basing this question wholly on your report, that sum which you have just found, $1,549,361 represents the amount that you have added to the item of reconstruction cost and working capital for paving and these other intangible items like going value and taxes and interest, etc.

1161 A. I don't know that it does.

Q. Will you please ascertain whether it does or not?

A. I have got to continue this calculation if you want to tell me what my figures show. Those are your figures, they are not mine.

Q. These figures are all taken from your report.

A. But they are not construed properly in my opinion. I can't answer it without going over the calculation.

Q. Haven't you just gone through?

A. I don't think your method of calculating is correct. I know one correct way and that is the way I am following here.

Q. There is no doubt about the item $330,558 for paving?

A. If you will tell me the figure you want I will get it for you.

Q. No doubt about that figure?

A. No doubt about the figure $330,558 showing the net construction cost of paving, shown in my report.

Q. No doubt about $583,000 as showing your estimate of going value is there?

A. No, sir.

Q. Now is there any doubt about this $635,803 representing everything else?

A. That is the figure which you gave me and in which I have no confidence. I want to calculate it in my own way. I don't know how you figured it.

Q. How long will it take you to verify that?

A. I don't know. I will do it as quickly as I can.

Q. What do you mean by that, do it now or do it tonight or do it some other time.

A. Well I will do it as soon as I conveniently can or make an effort to.

1162 Q. I wish you would just give the Master and I know you can give it in five minutes if you wish, the amount that you include in your $3,641,714 over and above the amount that you set over as reconstruction cost of the physical property?

A. I have not worked that figure out separately and it can't be obtained from my report or my data except on this calculation on which I am engaged.

Q. In other words no one can work out from your report that item except yourself, is that it?

A. I didn't say that. I say except by going through the calculation like this.

Q. Suppose the Master desires to know that, how is he going to find it out?

A. He can make the same kind of calculation I am making here.
Q. What kind of a calculation are you making?
A. You may follow it if you wish?
Q. Do you use these total figures?
A. Use nothing but figures out of the report, the figure asked for does not show in the report as a separate figure and you must arrive at it from details.
Q. Taking $3,641,714, that is the grand total?
A. Yes, sir.
Q. Now take out the reproduction cost of the physical property, $2,092,353 and what have you got left? Don't that give you the sum of those three items?
A. I don't know, I don't see that figure.
Q. Well just figure it out there and see.
A. $1,549,361.

1163 Q. The sum of these three items, the paving, the going value and this $635,803 make the total of $1,549,361. Now does not that represent the difference in your figures as shown in your report between the grand total of $3,641,714 and the $2,092,353?

A. I will have to complete my calculation before I can answer.
Q. You can't even accede to that?
A. No, sir.
Q. I would like to have you furnish for the Master and the rest of us at the coming of court tomorrow morning in separate items the amount that you have allowed and have worked out in your report in value or in cost over and above the amount that you have figured for the reproduction cost of the actual physical property.

Here the further hearing was adjourned until 9:30 A. M. tomorrow.

1164 Friday Afternoon Session.

JULY 28, 1911—at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of Complainant resumed as follows:

HENRY I. LEA, re-called for further cross examination, examined by Mr. Byers, testified as follows:

Q. One of the things I asked you for last night was to figure out for us your prospective business on the basis of ninety cent gas, did you do that?
A. No, sir.
Q. Why didn't you?
A. I didn't get time.
Q. Who paid you for your services in the Beatrice case?
A. I was paid through the council committee by the Gas Company.
Q. How much?
A. I have forgotten.

Q. The name of that company was the Gage County Gas Company?

A. I believe so.

Q. The Gas Company offered to pay you three hundred dollars?

A. Through the committee, yes.

Q. The money was from the Gas Company?

A. I suppose so; I don't know whether it was money that was due the city or not; but I was engaged by the council and through the council was paid by the Gas Company, as I understood it.

Q. You filed your report there about March 1st of this year?

A. I don't remember.

Q. You made it at the same time you made this report?

A. It was since I came here in January.

Q. You made it up at the same time you made up this report. worked on it at the same time?

1165 A. No, not at the same time.

Q. Then during the same period?

A. Yes.

Q. It was done in your office?

A. Yes, sir.

Q. Just as you may have been doing other jobs at the time?

A. Since I first came here.

Q. There was nothing paid by the city of Beatrice?

A. I understood the city was paying me.

Q. How did you understand that?

A. By being retained by them.

Q. How did you assume that when the Gas Company paid you?

A. When the Gas Company sent the money I assumed it was money owing the city.

Q. Have you got the Gas Company's letter in which they sent you the money?

A. No.

Q. What did you do with it?

A. It is in my office, if they sent a letter; I don't know that they did.

Q. They didn't pay you out there?

A. I have forgotten.

Q. Have you got a copy of your Beatrice report with you?

A. No.

Q. You have a copy in Chicago?

A. Yes.

Q. Do you remember the name of the city official you claim you dealt with out there?

A. No.

1166 Q. Do you have that in your office?

A. Yes.

Q. Now, Mr. Lea, yesterday we were dealing to some extent with your so-called value. What year did you begin in your computation with your going plant to get the basis for that end of your compitation as to going value?

Q. What year did I begin with the going plant—the date of the inventory is the first of January.

Q. I mean of the life and history of the plant, what year in the history of the plant did you take as the beginning from which you worked out this $600,000 going value?

Mr. GUERNSEY: It is $583,000.

A. The going value of the existing plant was calculated as the first of January, 1911.

Q. You don't understand my question. You don't mean $583,000 going value was all at once put into your plant on the first day of January?

A. I said $583,000 was in my opinion——

Last question repeated.

A. You mean the period covering the comparisons of the two plants?

Q. Yes, sir.

A. Well there was a period of seven years required.

Q. I am not talking about the seven years. I suppose you want us to understand that there was something, some service or expenditure represented by this $583,000?

A. My report shows clearly what is represented by that.

Q. What is represented by that?

A. If you will look at the report and follow me I can tell you.

Q. You can tell me in a general way?

A. I can't tell you as completely as I can by reading the report.

Q. Well, go ahead and read the report.

1167 Q. You want me to read all of the report?

Q. I don't think you understand the question, Mr. Lea, because I don't think it is necessary to read your report to answer what period was any part of this going value first earned or attached to this plant.

A. You are trying to ask me when was this going value accumulated?

Q. Yes.

A. It began when it began business.

Q. What year did you start with as the beginning of that business, to work it up?

A. The original company I think was started in 1864.

Q. What year did you begin with, the first figures you used?

A. You are not asking the question so that it can be answered by yes or no, certainly.

Q. No certainly that couldn't be answered by yes or no.

A. I am afraid you don't understand the calculation.

Q. What period did you begin to take this going concern—you accepted the situation up to some particular point?

A. Yes, sir.

Q. What was that point?

A. I came on this job to make the appraisal as of the first of

January, 1911. At that time the Des Moines Gas Company had acquired a certain going value; what that was I didn't know at that time. To find out what that going value might fairly be, I had to calculate what the other company would have to spend to equal the going company, what it would cost to duplicate the property and business of the going plant.

Q. When was the Des Moines Gas Company organized?

A. I don't know those dates.

1168 Q. I mean the present company?

A. I don't know.

Q. Didn't you inquire about that?

A. I heard some dates given, but they were of no interest to me; I didn't try to make note of it; the corporate title of the property has no interest to me at all.

Q. It didn't make any difference to you even in a rate case?

A. Doesn't affect rates.

Q. The organization of the company don't affect the rate either?

A. No, sir.

Q. If it should turn out to be true that this company was organized in 1906 and commenced to do business for the first time in Des Moines in the year 1906, would that make any difference?

A. Not the least.

Q. That wouldn't make a bit of difference with the question of going value?

A. No, sir.

Q. Now, if that be true, from your standpoint, on your theory, if it should so happen that the Des Moines Gas Company took over this entire plant in 1906 at less than the value of the physical property as fixed by you, and less than the reconstruction cost of it with the proper reduction, and then commenced its present business in the year 1906, would that make any difference to you?

A. No, sir; it wouldn't make any difference to me.

Q. Take the case we are trying and not a fictitious, hypothetical one, based purely upon theory, if it should turn out that the Des Moines Gas Company, when it was organized in 1906, took over the present gas plant at a valuation say of $1,750,000, and we will assume now for the purpose of this question, that according to your judgment and your valuation the physical, actual physical property which includes everything as you figured out the reproduction cost, leaving out all these items of going value and promotion expenses, and so on, just actual reconstruction cost of the physical property, and that amounts now to the figure you have there—will you give it to me again?

1169

A. What figure?

Q. The actual reconstruction cost of the physical property, the net construction cost?

A. The net construction cost of real estate plus buildings, works, equipment, plus distribution system I find to be $2,272,015.

Q. Now, in that item $2,272,015 there is no item of working capital is there?

A. No.

Q. And that item you figured at $150,896.00?

A. Yes.

Q. And the sum of these two items would be, as I make it, $2,422,911—is that right?

A. I haven't made those figures. I don't know.

Q. I wish you would; I want you to agree to those as we go along.

A. Are you trying to arrive at the total net construction plus working capital?

Q. Yes, sir.

A. Then you don't want to use the figure you have; you want to take $142,000.

Q. I don't care about that little addition—let it stand at $150,000 for the purpose of my question.

A. The total is $2,272,015.

Q. Now that would represent the net reproduction cost of the present plant on the first day of January, 1911, with $150,896. capital added?

1170 A. It would represent in addition $150,896 for working capital, to the total net construction cost to the physical equipment alone.

Q. The addition is in my saying reproduction instead of net construction?

A. Yes, sir.

Q. We call it net construction then; that in your judgment is what the physical equipment, the actual physical property, with this item of working capital added was fairly worth, leaving out these other factors, on the first of January?

A. No, sir, not on a net construction basis.

Q. Well, what was it; I don't want any of those additions; what I want is just the figures, the amount; I am trying to verify what you have given as the net construction cost of the first of January 1911.

A. You will get that if you stick to the books. According to my report the total net construction cost, acquisition of physical equipment alone, plus a corresponding allowance for working capital is $2,414,415.

Q. What did you add there?

A. I didn't add there.

Q. What did you take out of the $2,422,911.

A. I am giving you the net construction cost.

Q. What did you take out on those figures?

A. I say, instead of $150,000 $142,000.

Q. I told you that I wanted to use $150,000; you have taken out $6,000. the difference in working capital.

A. I have omitted lost interest during construction and taxes during construction on working capital.

Q. So you make then the amount $2,414,015.

1171 A. Yes, sir.

Q. Does that sum represent what in your judgment was the fair and reasonable value or reproduction cost whichever way you

want it of the actual physical property of this company on the first of January, 1911.

A. No, sir.

Q. What does it represent?

A. It represents only the total net construction cost of the physical equipment alone, plus the net construction cost of working capital.

Q. All right, have it that way. Now, then, assuming that that is the cost—you discriminate between cost and value?

A. Very distinctly.

Q. Assuming that was the actual net construction cost to this Des Moines Gas Company, what do you say the company has ever given to the community or anybody else, for this $583,000 of going value, if this statement now is correct, that the Des Moines Gas Company took over this property in 1906 for less money than what you have worked out here in reaching the net construction cost and the total net cost to them for the property, the total net construction cost did not exceed $2,414,015; you have worked out, what would this company give to this community or to its consumers in return for this $583,000 of going value?

A. What did it give?

Q. What would it give?

A. Haven't the community had a supply of gas all this time, satisfactory service?

Q. Has not the Des Moines Gas Company been paid for it?

A. I presume in part at least.

Q. What particular service would this company have given to this community for this extra $583,000 if my statement as
1172 to those figures is true?

A. It has performed all the work and made all the investment necessary in building up this business which cost money.

Q. What was it it has not been repaid for, what particular work?

A. I didn't say it had done the work it had not been repaid for.

Q. Now, Mr. Lea, if the Master should finally decide, the court should finally decide to accept your figures of going value, of $583,000 and add them to the construction cost, then it is your understanding, isn't it, that the company will be permitted to earn a rate or make a charge based upon that valuation, with the $583,000 added to it?

A. It is my understanding the company should be allowed a rate——

The MASTER: Please answer that question.

A. I can't answer it.

Mr. GUERNSEY: You mean you can't answer it yes or no?

A. I can't answer it yes or no.

Q. I will put the question in another way: you have included in your figures $583,000 as the so-called going value of this plant, and in your final summing up you add those figures $583,000 to the reproduction cost of this property, do you not?

A. Certainly, as a part of the reproduction cost of the physical equipment.

Q. And you understand when you do that that item of $583,000 is to be considered in fixing what would be a reasonable charge for furnishing gas in the city of Des Moines?

A. Yes, sir.

Q. And you made the figures with that in your mind?

A. Not with the fixing of rates in my mind.

Q. You knew it was a rate case?

A. I made it solely with the view of determining the
1173 present value of the property.

Q. You knew it was a rate case?

A. Yes, but that had no bearing on my valuation.

Q. You knew these figures you were furnishing to Mr. Haines were to be used for the purpose of convincing the Master that the rate fixed by the city in this ordinance was too low?

A. I did not know the rate was too low.

Question repeated.

A. No, sir, I did not.

Q. Now, then I would like to have you tell the Master just in your own way, just what service this Des Moines Gas Company, as it is now organized, has given to this community in return for the privilege of basing at least a part of the rate that they shall be allowed to charge for gas upon this $583,000, for all time to come; what have they given to this community for that in your judgment?

A. They have gone through a good many periods of uncertainty; they have sustained material losses in real cash; they have risked their investment in a business which is certainly not guaranteed by the community in the slightest degree; they have been under no protection whatever as to competing franchises, nor as to adverse action of the city council, nor as to competition from other sources; they have had no assurance as to the growth of the city; they have had net returns which certainly have not been excessive; they have maintained a satisfactory supply of gas and good service at all times.

Q. Anything else?

A. There doubtless are other things.

Q. It is your idea now that all these things enter into this going value?

1174 A. I didn't say that.

Q. What are you giving these things for?

A. They don't enter into my calculation of going value; I have shown you that.

Q. Now, this $583,000, what has this company given the community for it?

Mr. GUERNSEY: This question is objected to as argumentative, irrelevant and imaterial, because it is not contended here that the community has given the company or the company given the community anything on account of any property which the company owns. This question asks the witness what the company has given to the community on account of the element of the value of the property in the company's plant. The company did not buy the

plant from the community and did not give it anything for it; it is a mere matter of argument.

The MASTER: Let him answer the question.

A. This going value is not predicated on what the company has given the city nor what the city has given the company.

The MASTER: That don't answer the question.

A. I can't answer such a question.

Q. Let us see if you can answer it this way: You have already told me that you understand this rate controversy, the question to be determined here is the question of a reasonable rate to be charged this community for furnishing gas?

A. Yes.

Q. You also told me that that rate must be based to some extent at least upon the fair value of the property of the company?

A. Yes, sir, certainly.

Q. So that this so-called going value now is to be a part
1175 and is to — considered a part, on your theory, of the value of the property upon which the rate is to be fixed?

A. Necessarily so.

Q. You understand too, do you not, that that rate should be based wholly on the actual value of the property used in the business, don't you?

A. It should be based solely on the actual present value of the property used and useful.

Q. Now, then, if that be true, what I want to know from you, is just where this company is using in the business of making gas here now, and furnishing gas to the people, this item of $583,000 that you allow for going value?

A. I can't answer that without an argument.

Q. I wish you would tell us then—we will have to go back to your original proposition, it seems to be a little cloudy to me anyway—I wish you would tell us again in as brief a time as you can just how you arrived at your going value?

A. By finding out what a willing buyer would pay for that going value.

Q. How did you find that out?

A. By considering each of the items that make up the going value; the time required to reproduce the plant of the same kind of capacity in the same kind of a community; the expense required for the physical equipment, the purpose of the individual portions making up the total investment, the building up the business.

Q. Anything else?

A. That is enough.

Q. What part of that has this Des Moines Gas Company performed here in this community?

A. I can't answer that without argument.

1176 Q. Can you answer it at all?

A. Yes, sir.

Q. What have they done to earn this value?

A. I have answered that.

The MASTER: Suppose this plant, this new plant you are speaking

of was reproduced instantly on the first day of January, and the whole business had been developed, would that make any difference in your estimate of going value?

A. Oh, yes, that would reduce the going value, because the time required for building the plant would have been wiped out and you have only left the period required to develop the business.

Q. Then if it turns out that the correct theory is that the reproduction shall be instantly, then that would make a difference in the going value?

A. You mean the reproduction of the manufacturing plant on street mains and services but not the business.

Q. Yes, sir.

A. Such an assumption would reduce the going value. The fundamental method of calculating is that everything you assume must be humanely possible.

The MASTER: Suppose the correct theory of the law is that it shall be deemed reproduced instantly?

A. If the law were to hold that it would certainly reduce the going value.

Q. Have you given me every element you considered in arriving at the going value?

A. No, sir.

Q. What other element?

A. I haven't had time to think of them; I can't tell you off-
1177 hand; the calculation is before you and you can see it there.

Q. You don't consider anything except what appears in there?

A. All I consider are in there.

Q. I wish you would examine what the reporter has marked Exhibit 6 and state whether that is a copy of your Beatrice report?

A. I don't know, sir.

Q. Look it over and see?

A. I can't tell by looking it over. This is on the paper of an attorney and is not signed by me. I know nothing whatever about it.

Q. You can't tell whether it is your report?

A. I certainly cannot.

Q. Or whether it is one you have made in your office?

A. I don't know anything about the original of that copy.

Q. You don't know anything about it?

A. No, sir.

Q. Will you say to the Master that is not a copy?

A. I will say that is not a copy made under any authority of mine; nor have I ever seen this copy nor have I ever seen such a copy in existence. I will not say it is a copy of my report; it may be.

Q. You won't even tell us whether those figures are copies of figures you made?

A. Do you suppose I try to keep them in my mind?

Q. How did you work out the going value in Beatrice, Nebraska?

A. I would have to see my own report to tell you.

Q. Your report was filed out there, was it not, in February, 1911?

A. I don't know.

Q. And you say now you can't remember what plan or method you worked out?

1178 A. I wouldn't pretend to.

Q. It wasn't the same method you worked out here?

A. It was not; I did not know this method at that time.

Q. When did you first learn this method?

A. Early this spring, in this year, we discovered that this method had been used by water works companies in several cases.

Q. How did you discover that?

A. Through the fact that John W. Alvord of Chicago, consulting hydraulic engineer, had been using this system and used it in the Des Moines Water case.

Q. This was all worked out after you came to Des Moines?

A. No, sir; this has been in use for twelve years.

Q. I mean as far as you are concerned?

A. I never used this method of calculating before the spring of this year; I have determined going value before, but always by methods much more open to argument than this.

Q. About what time was it in the spring you found out about this?

A. I don't know.

Q. Can't you give us any idea except that it was some time in the spring; was it before June?

A. I don't remember.

Q. Before July?

A. I don't remember; it was before I made this calculation; that is all I can tell you.

Q. Are you acquainted with Mr. E. O. Kretzinger of Beatrice, Nebraska?

A. I don't remember the name.

Q. Is he the man you dealt with out there?

A. I don't remember.

Q. Do you remember the name of the manager of the gas company?

A. Yes, Thomas Rice.

1179 Q. But you can't remember any member of the committee of the city?

A. No, sir.

Q. I want to put another question to you, Mr. Lea, a hypothetical question in a sense—suppose that the Des Moines Gas Company, the complainant here in this case, had bought and paid for this plant, complete as it was in all its parts in 1906, and paid one million dollars cash, and then they had added in the five years since, five and a fraction years, the extensions and services and additions to the property generally that their books show has been added as a matter of fact, and the reproduction or construction cost of all that was added, I mean the net construction cost without any of those other matters, like going value, up to two million dollars, on the first day of last January, now would you still say that you would work out, or it would be fair to work out this going value in just the way you have

and add the $583,000 to that two million dollars, for the purpose now of arriving at a reasonable and just rate for gas in Des Moines?

A. I don't know that $583,000 would be the going value under the conditions you name; I couldn't tell you without working it out.

Q. How do the conditions I name affect it?

A. You are using different amounts.

Q. I have assumed now that the property had just the position of the property, just as it has been, the same business, the same town, everything in that respect the same, and the Des Moines Gas Company buys the business in 1906 for a million dollars cash; that is all they had to pay. Now since 1906 they have added just the equipment that their books show and which this onvoice shows,
1180 and we will say for the purpose now of the illustration—I simply want to test your notion or theory about it—that the construction cost, reconstruction cost would be just as you had figured it out, but for the purpose of the illustration we will say it was two million dollars, the company would have to pay for the property in 1906 and what they paid for additions and extensions since, and all of that amounted to exactly two million dollars; now would you say it would be fair to add a going value of $583,000 to that for the purpose of fixing rates in this community?

A. Are you assuming on the first of January, the property and business of the company and the characteristics of the city were as they were at that time?

Q. Exactly.

A. Then the same amount of going value would certainly be allowed in my report.

Q. So that then it is your notion and this would be the result of your theory, would it not, that if the condition existed just as I have supposed it and you add $583,000 for going value, then this community would be paying a return upon that $583,000 in the rates that were charged for gas for all time to come?

A. Not for all time to come, they would until further adjustments might be made.

Q. As long as there were no adjustments made that rate would have to be carried on?

A. Yes.

Q. So that I was right when I say they would be paying a rate upon this $583,000 for all future time?

A. They should pay a fair rate on the actual value of the property used and useful.

1181 Q. Even though this intangible thing of going value——

A. It is not intangible.

Q. Even though this going value was an item for which this company had never contributed a single dollar or single day's time to anybody in accumulating or creating it?

A. You are assuming a physically impossible condition. I have no answer to make to it beyond that.

Q. It would be physically impossible?

A. To reproduce the business without the expenditure of time and money.

Q. Your theory is, it don't make any difference what the property of the Gas Company, you would add it?

A. I don't care what it cost, if it cost money to develop the business and cost money to develop the plant, or time, then these elements would be considered.

Q. So far as your going value is concerned, you don't care anything about what the complainant, the Des Moines Gas Company invested in this property or what he paid for it?

A. No.

Q. You get at this going value and credit it to them just the same?

A. I arrive at the same reproduction of the present values of this property regardless of what the company paid for it.

The MASTER: Turn to the letter there of June 26, 1911; you figure the buildings $82,445.

A. Yes, sir.

The MASTER: And the works equipment is what?

A. $384,700.

Q. Now, omitting the real estate, is that what you estimate the present value of the equipments, including the distribution system works and equipment and the building of this plant?

A. No.

1182 The MASTER: I am talking about the physical equipment.

A. But the going value is an attribute of physical equipment.

The MASTER: I am not talking about that now. What I want to know is what is the actual present value of the physical equipment without considering the going value.

A. Do you went the total of those three items?

The MASTER: Yes, minus real estate.

A. $2,200,131.

The MASTER: You have it the same as I have except the going value there is a difference of one dollar.

A. Yes, I dropped it there.

The MASTER: Then you do not take into consideration in this the organization and legal expenses, real estate or going value?

A. No.

Mr. BYERS: I have been trying to get this for a day and a half, except that I was dealing with the reproduction cost. It simply shows that the witness will respond to the Master when he won't to me.

Q. Now, Mr. Lea, I think I have your notion of going value, and now just a little while on pavement. That $300,000 is that included in this $2,200,000?

A. Is that the total paving?

Q. Yes.

A. That is a part of the distribution system, present value.

Q. Now, you worked that out and included it in here, understanding that it also is to be considered as a part of the value of this property for rate making purposes?

A. I put it in there with the understanding it was an
1183 essential part of the reproduction value of the property for rate making purposes or any other purpose.

Q. What did you say was the life of the ordinary gas pipe?

A. I didn't say.

Q. Will you say?

A. If you name the size I will tell you.

Q. Well, beginning down with the small sizes, say 4 inch or 6 inch?

A. Cast iron?

Q. Yes.

A. Four inch cast iron I estimate the life fifty years.

Q. Six inch?

A. Seventy-five years.

Q. Eight inch?

A. Seventy-five years.

Q. Ten inch?

A. Seventy-five years.

Q. Twelve inch?

A. Seventy-five years.

Q. Sixteen inch?

A. Seventy-five years.

Q. Fourteen inch?

A. Seventy-five years.

Q. Twenty inch?

A. Seventy-five years.

Q. Twenty-four inch?

A. Seventy-five years.

Q. Now, what is the life of the ordinary asphalt pavement?

A. I don't know.

Q. What is the life of the kind of pavement you figured?

A. I didn't care what the life of the pavement was.

1184 The MASTER: If you know, say so.

A. I don't know.

Q. You didn't make any inquiry about that?

A. No.

Q. If it should turn out then, Mr. Lea, that upon these streets where you have figured out this $300,000—just assume for the purpose of this question one of those streets is Walnut, from the river on the east to say Thirteenth on the west, now if it should turn out that about the time that this gas — compelled to relay its pipes on Walnut street, and the pavement is ready to be relaid and the city is tearing it up for the purpose of relaying, and the Gas Company lays its pipe during the time that work is being done without having to tear up or replace the pavement, this complainant company then would have added to the value of its property and upon which the people of this community would be paying for that much pavement for which this company never would have to pay out a cent?

A. No, sir; if the truth were as you stated, there would be no allowance in the reproduction value. It is physically impossible to

relay mains as required if you only relay them when the streets happen to be torn open for repavement.

Q. If it should turn out that was done, as I stated, and the company had the advantage of laying the pipe during the time the city was relaying the pavement, then under your method of figuring this community would be paying upon a valuation enlarged by the amount you figured?

A. It would not. The reproduction value would be correspondingly reduced, the present value would be.

Q. How would the people get it back?

A. They would get it back right there in the reproduction cost.

1185 Q. Get what?

A. If you can show that it is going to be so, I will willingly make a reduction.

Q. But suppose it turned out to be the case, all the time between now and then the people have been paying upon this added value; how are they going to get that back?

A. If that were true, I would reduce my value.

Q. That is not a fair answer. I am assuming that Walnut street between the points I have stated, one of the streets now included in your $330,000, I am assuming that when the pipe that is now laid there must be relaid, the streets are torn up and the Gas Company—say it is twenty-five years from now—and the Gas Company lays its pipe while the pavement is torn up, under your theory and figures, if they are adopted by the Master and the rate is fixed on them with this pavement added, the people of this community will have been paying upon that added value for a full twenty-five years?

A. You are assuming a condition you are willing to say is existing?

Q. If it does exist?

A. If I have assumed this street is not to be open at the time of relaying this particular main, and have therefore included paving over that main as a part of the reproduction cost, and then when the time comes for the actual relaying, and the expense of tearing up and replacing the pavement is not borne by the company, then obviously my rate would be too high to that extent.

Q. Now, just one more question, and then I will pass that. Assuming the facts as I did in the former question, and it was twenty-five years hence, and the Master had accepted your theory and your figures, then the people of this community would have been paying for twenty-five years to this Gas Company upon that added

1186 value?

A. On that insignificant fraction of the value of the pavement.

Q. On that much of it anyway?

A. Yes.

Q. How do they get that back?

A. It would be so small, you couldn't find it in a cent.

Q. All Walnut from the river to Thirteenth street would be so small that you couldn't find it in a cent?

A. Certainly; figure it out and see how it would affect the price of gas.

The MASTER: You figure two per cent under this ordinance?

A. Yes.

The MASTER: You figure two per cent and the other taxes besides?

A. Yes, two per cent is on the revenue from the sales of gas, and the other is county, state and school. It is shown in the calculation.

Q. Now, Mr. Lea, you have made no deduction of any kind in your figures or in your report for any such contingency as I suggest with respect to the pavement, have you?

A. No, sir; because I don't expect it to occur.

Q. But you did add eight per cent to this enormous total value of this property for the company for any little omissions or contingencies that might be found?

A. Yes, sir.

Q. What amount did you figure that eight per cent on, what total?

A. It wasn't figured on real estate at all.

Q. Just tell me what total it was figured on?

A. I don't know the total amount; I could get it. Wouldn't you rather have the total of engineering and which includes the eight per cent, or do you want the eight per cent separately.

Q. Well, take the fifteen per cent?

1187 A. Well fifteen per cent on the entire plant, I used it on buildings, works equipment and distribution system only, on real estate $5,000 and total for engineering, casualty liability, etc., is $313,411.

Q. I want to get the figures you multiply by fifteen?

A. I haven't the total; I have the result which is $313,411.

Q. Now, if you take $5,000 out of that it will give what you allowed on everything except real estate?

A. Yes, sir; buildings, works, equipment and distribution system.

The MASTER: Right there, would it apply to the present value?

A. It would not because the reproduction cost has been depreciated on everything except real estate. I have that worked out I think in the form you would want it here.

The MASTER: If this eight per cent should be eliminated then I would have to go over all these items?

A. Yes, then you would have to take it out of such items as the eight per cent has entered, buildings, works, equipment and distribution system and deduct it from the total of each of those heads.

Q. You say the eight per cent is figured in what?

A. As a part of the fifteen, which is added to the net construction cost of the buildings, works, equipment and distribution system.

The MASTER: What effect does that have upon the present value?

A. That increases the present value, because it of course brings your reproduction cost up, but this reproduction cost is depreciated because of the present condition of the property. To bring you back to the present value. Here is the difference between the total of the amounts included in my report; engineering, casualty liability, omis-

sions, contingencies, tax during construction, loss of interest
1188 —there is a total of $582,699 in the reproduction cost. In the present value there is a corresponding allowance of $507,-141. Of the amount I have shown as the present value of the property $507,141 covers the items of engineering, casualty liability, omissions, contingencies, tax during construction, loss of interest during construction on the assumption that none of the going value has been credited to the physical equipment.

The MASTER: What is the present value of that?

A. That is the present value. The reproduction value of that corresponding item is $582,699. In other words, there is something over $75,000 less in the present value than in the reproduction cost for these overhead charges I have named.

The MASTER: I don't want to be understood as indicating any view on that eight per cent, the two per cent and five per cent that he has figured to get the exact amount of net construction cost, then he adds fifteen per cent to get the reproduction cost; that includes five per cent engineering, two per cent casualty liability, eight per cent for things forgotten. I recognize the fact there may be some dispute over these propositions and I want to get the figures, if I should hold one way or the other, I would know something about these figures.

The WITNESS: To these totals net construction cost, plus fifteen per cent, are added taxes during construction and loss of interest during construction in arriving at the total reproduction cost. You take out the item of taxes during construction and add it to these other items you have $72,759, my allowance for taxes during construction.

Q. That is new, you mean?

1189 A. That is the whole amount of taxes during construction on the reproduction of the plant.

Q. Of the new plant?

A. Yes.

Q. What was the amount of interest?

A. $196,529.

Q. Was that depreciated any?

A. No, that is on the reproduction. Taking engineering which amounts to $313,411. The tax during construction of $72,759.; and the lost interest dueing construction, of $196,529. and you have a total of $582,699. which is included in my total figures of the reproduction cost shown in the letter to Mr. Haines. Now then the amount covered in the allowance for present value, of course is less because overhead charged depreciate as the buildings and equipments depreciate; depreciating each in these amounts by the composite per cent condition instead of $582,699. or $507,144 which is the corresponding overhead charge included in my present value make a figure of $3,261,705.

Q. Now, while you are right there, will you give us the figures please, the full amount of the three items, first the amount that was added for paving?

A. $330,558.

Q. And your going value?

A. $583,000.

Q. Now, then what is the sum total of these so-called charges?

A. The overhead charges I have given you on the reproduction basis, $582,699. or $507,144. on the present value basis.

Q. On the reproduction basis it is $582,699.

A. Yes.

1190 Q. Organization and legal expenses was what?

A. The net construction cost $62,000.

Q. Even?

A. Yes. The corresponding amount for working capital is $142,000.

The MASTER: I don't think his calculations are correct. I wish you would go over them again. I think when you come to figure it down you will find they are not.

Q. Now, I have those items, paving $330,558.

A. That is the net construction cost.

Q. Going value $583,000.

A. That is the reproduction cost.

Q. Taxes, interest and overhead charges $582,699.

A. Yes.

The MASTER: Here is what I am interested in. To each of the items you add fifteen per cent?

A. To each of the items, buildings, machinery and distribution.

The MASTER: Now, then you calculate on that the present value?

A. The present condition and then the present value.

The MASTER: You can't get at how much that is or reduce it to an analysis unless you go to the items?

A. No; unless you go to the items to which it was applied.

Q. Now, I had $582,699 for taxes, interest and overhead charges.

A. That is the total of the allowance on reproduction cost basis for engineering, casualty liability, omissions, contingencies, taxes during construction and lost interest during construction.

Q. Then I have an item here of $62,000. That is for promotion and legal expenses, and so on?

A. That is parallel of what we call the net construction cost of the balance of the stuff. It is the cost of legal organization,

1191 expenses without any addition for engineering or taxes or lost interest.

Q. What is the sum total of these four items, leaving out the capital—the paving, the going value, overhead charges and the $62,000 organization and legal expenses?

A. The total net construction cost included for paving, plus the corresponding amount for organization and legal expenses, plus the corresponding amount for working capital, plus the total amounts allowed for engineering, casualty liability, omissions, contingencies, tax during construction and lost interest during construction is $1,117,257.

Q. Now give me those items, first the net construction cost of paving?

A. $330,558. Organization and legal expenses $62,000; work-

ing capital equipment $142,000; the balance of these items overhead charges $582,699. that makes a total of $1,117,257.

The MASTER: How do you make that $142,000 instead of $150,000?

A. If you refer to the second page B you will find I think $142,000 as the net construction, and the tax appears as overhead and the loss of interest appears as overhead.

Q. Now, the item of paving is $330,558.; the going value $583,000; the overhead $582,699.; organization and legal $62,000. What is the total of those items?

A. The total of the net construction cost for paving $330,558, plus going value $583,000. plus overhead as previously defined $582,699. plus organization and legal expenses $62,000, equals $1,558,257.

Q. Now, Mr. Lea, please state what that total represents as a total in the record?

1192 A. I don't know.

Q. If you take that total now and subtract that from your total reproduction cost, what have you then?

A. Substracting the sum of $1,558,257. from the sum of $3,641,714 will leave the sum of $2,083,457.

Q. Will you tell the Master what those figures represent?

A. I don't know what they represent.

Q. You don't know?

A. No, sir, I can't give that amount a name.

Q. How would it do to say that represented the net construction cost less these four items you just footed up?

A. That would be incorrect.

Q. In what respect?

A. Suppose you try it, and see if that is true. Subtract those four amounts from the net construction.

Q. The reproduction cost I mean?

A. Subtracting from the total reproduction cost the total of the four items leaves $2,083,457.

Q. Then that $2,083,457. represents your judgment and the valuations as made by you in your report of the reproduction cost of the property of this plant, outside from those four items?

A. That figure is not my figure and doesn't mean anything to me.

Q. Don't mean anything to you?

A. No.

Q. Is my statement correct?

A. It is not.

Q. What is the matter with it?

A. You are making me say something I am not saying.

Q. You are not willing to say what $2,083,457 represents worked out from the report that you furnished us?

1193 A. I am not willing to say what you mean by such a combination of figures that you make when I don't see that they mean anything.

Q. Is there anything wrong with the four items I gave you?

A. They are correct as items.

Q. What I want to arrive at is the amount or value or cost or

whatever you may term it that you arrived at for the physical property of this company, free from any of these four items?

A. I cannot arrive at the reproduction cost of the physical equipment in this property without considering those others.

Q. Well, give us the net construction cost then?

A. Net construction cost of what?

Q. Of the physical equipment of this property without any of these figures in them.

A. The total net construction cost of the physical equipment is shown in Exhibit E to be $2,272,015.

Q. Now then give me the reproduction cost as you worked it out, give it to the Master and state it in the record less these items.

A. The sum of the four items I gave you is $1,558,557. I can only speak of those amounts as figures; they represent nothing.

Question repeated.

A. You have no reproduction cost until you have allowed these other items.

Mr. BYERS: I do not like to appeal to the court with respect to a witness, especially not as intelligent a man as this is, but I think we have reached about the limit. I have tried to get along with this man for a day and a half. I don't want anything from him that he cannot figure out from his report. Here is a report that he has offered and he has a theory that he has worked out. It is
1194 entirely proper that we ought to fully understand it. It seems to me the witness is not trying to either assist the Master or counsel.

The MASTER: That is the only trouble with the witness; he is all the time trying to sustain his theory instead of answering the question. I say again, answer his question; if you can not answer the question, say so. Don't enter into any argument.

Q. Now, I will put that question again. I wish you would give to the Master the difference between the total, as you have used it in your letter to Mr. Haines, of the reproduction cost of this plant, and the sum total of the four items which you have figured up there to be $1,558,257?

A. The difference between the sum of $3,641,714, which I give as the total reproduction cost of this property, and the total of the amounts comprising the net construction cost of paving, plus going value, plus the amount corresponding of the net construction cost of organization and legal expenses, plus the amount called overhead, which covers engineering, casualty liability, omissions, contingencies, taxes during construction, loss of interest during construction, is $2,083,457.

Q. Now the amount of $3,641,714, is the amount that you give in your letter to Mr. Haines as the reproduction cost?

A. It is.

Q. You gave us the taxes Mr. Lea as $72,759. What would it be depreciated if you worked it out that way?

A. I can't tell you off-hand.

Q. Can you give us the lost interest depreciated off-hand?

A. Not off-hand.

Q. How long would it take you?

1195 A. I don't know.

Q. Can you do it in time for this afternoon?

A. I can't do it during lunch hour.

Q. How about those other figures I asked you for last night, on the prospective growth of business under the ninety cent rate?

A. I haven't them.

Q. When will you get them?

A. I can't say when they will be done.

Q. Have you worked at them?

A. I am not yet working on them.

Q. I wish you would remember these two items of taxes and the item of lost interest and work them out for us so that we can have them some time during the hearing?

A. You want to show the amounts included for taxes during construction and lost interest during construction, as they might be properly extracted from the present value shown in the letter to Mr. Haines.

Q. Yes, sir. Now, Mr. Lea, in attaching your values to the separate items in the invoice Exhibit 15, you, as I understood you yesterday, took the figures just as Mr. Broadnax and his men had made them, except in a very few instances where you either ignored them or found some little errors?

A. The figures in the inventory you are speaking of—perhaps I have made you misunderstand what I emeant when I said there were figures in that inventory which I have not accepted. There were figures as to the quantity of paving necessary to take up; I have my own ideas about that and took my figures.

Q. Was yours larger than theirs?

A. I did not make any comparison between the results. I noticed they had some amounts there, which didn't mean anything to me.

1196 Q. You didn't agree with whoever worked out the inventory?

A. I didn't see any reason for taking their practice, I had my own practice for that.

Q. I notice in your report for instance in some places where you are dealing with the laying of brick you credit $17 a thousand and in other places $16 a thousand and one or two places maybe as low as $15. Take your $17 item, what does that cover?

A. That covers the labor and material entering into the laying of brick.

Q. Anything else?

A. It covers the brick laid in the wall with all the charges incident thereto the same as you would pay the contractor.

Q. It would include the contractor's profit?

A. Oh, yes, the net construction cost throughout includes the contractor's profit.

Q. Where did you get your information about the costs of contractor's prices in laying brick in the city of Des Moines?

A. I got some information here, and I compared it with information I had from other parts of the country.

Q. Who gave you the information here?

A. I got some from the company in a statement made up by three *three* contractors.

Q. Do you know their names?

A. Yes, I think so. Mardis was one.

Q. J. C. Mardis?

A. Yes. I don't remember the other two.

Q. Did they give you $17 a thousand as the going price in Des Moines for laying brick?

A. I would have to look up that record.

1197 Q. Did it make any difference what kind of brick were used?

A. Oh, yes.

Q. You were dealing with the kind of brick in these buildings down here?

A. Exactly, except there might be some little odd size brick there; there is a slight variation in different yards in the same locality. I have not tried to distinguish between brick that were for instance 2¼ or 2½ inch by 4½ etc.

Q. I am talking about the expenses of the cost of brick?

A. I have used the prices that appeared to me fair for the kind of brick used, and the number of brick in the given building I have taken from the inventory.

Q. You paid no attention to the number of brick except as you found it in the inventory?

A. Yes.

Q. What is the price of brick in Des Moines?

A. The price varies with the kind of brick; I would have to look up my records.

Q. I mean the kind of brick used?

A. I would have to look up my records; I never carry those figures in my mind.

Q. You got prices in other places?

A. Yes, sir.

Q. Of the kind of brick used here?

A. Yes, sir; common brick, pressed brick and paving brick.

Q. In the matter of excavations I notice, without calling for particular items or pages, that your valuation on excavation runs from sixty cents to $1.30; I think you made some higher than that; where did you get your information about the cost of excavation in Des Moines?

A. I made some inquiries and used the information from

1198 other parts of the country.

Q. If it should turn out, Mr. Lea, that the usual price for excavation, say take the excavation where these two south tanks are or holders, whatever you call them, that the ordinary usual and and every day price of that kind of excavation was from fifteen to eighteen cents per cubic yard, would you still think the Master ought to take your prices from sixty cents to $1.30?

A. My prices from 60 to $-.30 is based upon the particular kind of work and the volume of work.

Q. You know where these two oil tanks are?

A. Yes.

Q. You saw the character of the excavation there?

A. Yes.

Q. If it should turn out that you could get all the men you wanted to make that kind of excavation here in Des Moines and could at the time that work was done, and could every day since, for from 15 to 18 cents, you would not still insist that your value from sixty cents to $1.30 should be taken?

A. Not on that particular item, if I have used that.

Q. You haven't anything under sixty?

A. I have in some places. I don't remember where they are. I do not suppose my detailed items will be found to agree throughout with what you can actually do here, and a variation like the one you speak of would not affect my judgment of the value of the properties, because I know there are other items, I must have been on the other side of it. The figures I used is what I knew to be fair for that kind of work throughout the country.

Q. So your idea is, in all cases where you have valuations too high, there must be corresponding cases where they are too low, so that what you furnish is an average and not a real value?

1199 A. I furnished you what in my opinion was a fair rate.

Q. You got at it by the process of averages?

A. Averaging results which I find around the country in corresponding work.

Q. I thought you added fifteen per cent to cover your mistakes?

A. That is a different item altogether.

Q. That hasn't anything to do with those valuations?

A. Not in that sense.

Q. That is supposed to cover things the Gas Company did not know they got, or the Gas Company hasen't furnished you the items?

A. Eight per cent is to cover just exactly what I intended to.

Q. That was omissions?

A. Omissions, for instance, ordering material by various parties for the duplicate plant the cause of delay and consequent expense together with all such contingencies as all big construction work is exposed to.

Q. I thought you told us yesterday you checked those things carefully and you gave your judgment on every item of property that was in here?

A. I didn't say that. I said I had checked the inventory sufficiently to satisfy myself as to the substantial accuracy of the items given.

Q. Do you think some are not in there?

A. I know there are.

Q. Of enough importance to be considered?

A. Yes, of enough importance to be considered. I suppose the

items omitted will amount to several thousand dollars; it is physically impossible to include everything.

Q. You think you have got that high enough?

A. That is one of the things I have to include in my omissions.

Q. Then there ought to be several thousand dollars more
1200 added to your inventory?

A. No, not in my judgment.

Q. In this report of yours I notice in figuring going value you get in advertising and soliciting?

A. As operating expenses, yes.

Q. You worked that in your going value proposition?

A. Yes, on both sides of it.

Q. You never did that before, work in advertising and soliciting in going value before?

A. Yes.

Q. You did not do it at Beatrice?

A. I did not know this method then.

Q. You advised the people out there it should not be used?

A. I did not.

Q. It would be wrong to use it?

A. I certainly did not.

Q. Isn't this what you advised the Beatrice people—I will read it to you: "There must also be added to the physical equipment certain amounts which make up the difference between the value of the physical equipment alone and the value of that same equipment when actually connected up with the consumers' appliances and in actual use as a going concern." Do you remember that statement?

A. I do not; I may have made it, I certainly don't remember.

Q. You go on: "This difference is known as going value and is made up as follows: 1907 meters, $22.; $24,134. Estimated losses for three years $9,000; total $33,134." Do you remember that?

A. I don't remember it.

Q. You say you did not advise that?

1201 A. I do not say I did advise it.

Q. Do you say what I have read is a part of your report?

A. I don't know that it is not; I don't say it is not; I know where to go to find the facts if I want them.

The MASTER: Now, I see here the purifying house A and B the total net construction $9,507.

A. Yes.

The MASTER: Now figure what you added to it?

A. Each of the buildings is shown in Exhibit G, with the details making up the total net construction cost for each of those buildings. Now I take all of this total net construction cost for buildings and add them together, and that gives a total $85,723.

The MASTER: I am asking about a particular one; how do you get this sum here for building A and B?

A. By adding to the net construction cost of the building fifteen per cent and then add to it its percentage of tax during construction and the percentage loss of interest; those percentages I have in my office.

The MASTER: That is just what I wanted to know. Then as I understand it you get $11,860 the total reproduction cost, you add fifteen per cent of the net construction cost which is $9,507. and then you add a percentage of taxes whatever that may be and that gives $11,860.

A. Yes, sir. I can go right through with the building if you wish.

Q. The MASTER: Well do that now.

A. I get $10,933. Now we take the total net construction cost of all the buildings to arrive at the percentage of the total construction cost, which is $85,723; that is the total net construction cost of all the buildings, and add fifteen per cent to that which
1202 gives $98,581. the total which I have included for taxes during construction cost of the building is $2,264. We will divide $2,264 by $98,581. to find the percentage of taxation to be added to the individual building.

The MASTER: What is your percentage?

A. It is 2.29 per cent; almost two and three-tenth per cent.

Q. Of what?

A. Percentage added to the net construction cost plus engineering, to arrive at the amount of taxes. I start out with the net construction cost for building one, A and B, $9,507, and add to that fifteen per cent covering casualty liability, omissions and contingencies you have $10,933. Your next step to determine the amount of tax during construction on that amount, which is determined from the chart and each of the steps shown, and the total amount of tax allowed because of building is $2,264. The total of the net construction cost plus fifteen per cent for engineering, etc., is $98,581; that is, for taxes during construction there has been added to the net construction, plus the fifteen per cent and another percentage of 2.296, which is the average percentage to be added to each of the building units because of tax during construction. Multiply the net construction cost, plus fifteen per cent by this percentage, 2.296 gives $251. which is the amount of tax to be paid during the period of construction upon this particular building one A and B. The tax that you pay during this period of construction, must be added to the other costs of the building and they represent an outlay of cash, consequently you are losing interest on that money. But it is assumed the money spent during the given year is spent at a uniform rate. Therefore the loss of interest on that amount is only one half as much as though the amount had been placed at
1203 the beginning of the year. Then you have to add the net construction cost plus fifteen per cent the amount of tax divided by two, because his interest in only paid on half of the property, and that means you are paying $251 taxes; add that to $10,933 gives you $11,059. Your loss of interest is based on the

latter figure, $11,059. The total amount allowed for loss of interest in my report on account of buildings is $6,089 or a percentage on the net total reproduction cost of $98,581. of 6.176 per cent. That percentage has to be added to the money you have accounted for up here. That percentage worked out gives you $683. In other words, you have your net construction $9,507. to which you have added fifteen per cent, giving $10,933. Then you have added your taxes, $251 and to that you add $683 for lost interest during construction; the total amount of taxes paid on this building is $251, that is the total amount of tax paid after you made this assumption that the money going into the building throughout the year is charged at the rate of a half a year. So $251 is the amount to add here on that account. Now, then, you go back to the net construction cost beginning with building 1-A and B net construction cost $9,507. add fifteen per cent for engineering, etc., which makes $10,933. add to that the tax $251 and the lost interest during construction, $691. and you have a total reproduction cost for that building $11,875.

The MASTER: Did you figure the distribution system the same way?

A. Exactly.

The MASTER: What is the total amount of taxes you figure?

A. $72,759 is the total.

Q. Right at that point, Mr. Lea, what is the final figure that that *that that* building goes into this valuation for?

1204 A. $9,106. present value.

Q. Now, what was its reproduction cost?

A. $11,860.

Q. I mean without overhead, tax and interest, net construction?

A. Its net construction was $9,507.

Q. The amount it finally went in at?

A. $9,106.

Q. It goes into the valuation after depreciation at nearly one hundred dollars more than the net reconstruction cost, is that it?

A. No.

Q. Oh, $9,100 it goes in at?

A. It goes in $9,106 present value, the net construction cost being $9,507. It goes in at less than the net construction cost before any of the overheads have been added.

Q. How old is that building?

A. Nineteen years.

At this time an adjournment was taken until 1:30 p. m.

1205 1:30 p. m., FRIDAY, *July* 28, 1911.

HENRY I. LEA being continued on cross examination by Hon. H. W. Byers, testified as follows:

Q. What the reporter now has marked defendant's Exhibit "A" is the computation that you worked out for the master just before dinner as it affects Building 1, A and B, is that right?

A. Yes, sir.

Q. Now this computation was worked out by you by using tables and figures that appear in your report that has been marked Exhibit 20, is that right?

A. The figures were all taken from Exhibit 20. I don't know just what you mean by tables unless you refer to the columns of figures as tables.

Q. Tables or figures?

A. Yes, sir.

Q. In other words the information necessary to make this computation in the first place and to clear them up if that seems to be necessary will be found in your Exhibit 20?

A. Yes, sir.

Q. On the same method of arriving at the different items that are finally included by you in the total with respect to buildings, all the other buildings can be ascertained the same way?

A. Yes, sir.

Q. And must be ascertained the same way from your exhibit 20?

A. Yes, sir.

Q. Now you say you figured six months as the time necessary to construct this building?

A. This particular building I estimate will have been com-
1206 pleted at the end of the year 1912?

Q. At the end of the year 1912?

A. Yes, sir.

Q. Then you gave to that building as the period for construction two years?

A. No, sir.

Q. When does your period begin?

A. The building is not started until the spring of 1912, but it is completed during that year.

Q. The erection of the building is not commenced until the spring of 1912?

A. No.

Q. But it is completed what time in 1912, about according to your figures?

A. Well before the end of the year. The dates I would have to get from my office I have not got detail here.

Q. Then there would be no way we could figure out that detail from your report?

A. Yes, sir.

Q. Then you must be able to get it without getting detail from your office?

A. You have it right here. If you will look at the end of that column under the year 1912 showing reproduction expenditures you will find that all of the buildings are completed during the year 1912.

Q. I know but that does not answer my question. You have already said it was completed during that year but what I want to know is just the number of months, weeks or days you have used in your computation and in your percentages for the construction of these siveral buildings.

1207 A. I don't recall the dates of the several buildings, all I have here is the fact they were begun after the first of January and completed before the first of the following year, all of the buildings.

Q. Then there is no way we can find from the report as it is made up just exactly the period that you have used in arriving at these percentages and these figures.

A. Yes, I show here that that construction is assumed to proceed at a practically uniform rate throughout the year, consequently the taxes on the construction of that series of buildings during that one year will be the equivalent of the ordinary rate on the total amount for one half a year.

Q. Well, in other words then, you have figured on a period of six months.

A. I have assumed that the rate of investment for the purposes of arriving at taxation would be most fairly taken as running uniformly throughout the year. As a matter of fact I believe you would have a little more than half the money invested before half of the year and that would bring taxes up some but it is safe to take a uniform rate of construction there that would be fair.

Q. Then you assume the process of building would continue through the year?

A. Through the building construction portion of the year.

Q. Well how much time would that be, that is what I am getting at.

A. That is as soon as frost is out of the ground in the spring here you begin and before the frost is in again you are through.

Q. That would be about the 1st of April, is that your idea?

A. I would have to get my notes to see what date I began on definitely.

1208 Q. Could not give that information without your notes?

A. Not all that is needed for this purpose right here.

Q. For this particular building you have added in $251 taxes?

A. Whatever I worked out there this morning, I don't remember the details.

Q. That is what seems to be here, $251. What rate did you figure the taxes here?

A. At 2 and one fourth per cent per year.

Q. And what valuation of the property?

A. Full valuation.

Q. Did you know that that was not the Iowa rule or Iowa method?

A. I was told it was, I considered there that was the rule here at the time.

Q. Isn't this what you were told the rule was, you took the full valuation, say a piece of property was worth $10,000 then for taxation purposes that is divided by four so that the value for taxation purposes would be just one fourth of that, didn't you understand that was so?

A. You have not made a complete statement. I understood that the basis of assessment was 25 per cent of the value of the property and that on that 25 per cent the tax rate was 90 mills which is the

equivalent of two and one fourth per cent on the full value. I used two and one fourth per cent on the full value which I was told by the assessor was the correct rate.

Q. That is the way you got at it, you figure on a basis of 25 per cent of the value of the property?

A. No, sir; I figured on a basis of two and one fourth per cent of the full value of the property.

Q. I know, but you figured that would be equal to taking the full value of the property and putting your tax rate upon one
1209 fourth of it.

A. At the rate of 90 mills certainly.

Q. You knew of course taxes were payable but once a year here?

A. I did understand so yes.

Q. And that there is no interest or penalty or charge upon the tax until they are due and delinquent, you knew that didn't you?

A. I made no allowance for any delinquency at all, nor excess charges of any kind.

Q. In getting at your interest what rate of interest did you allow?

A. Six per cent.

Q. Is that the rate you have charged all through your computations.

A. That is the rate I have used wherever loss of interest is considered.

Q. How about your sinking fund, what rate did you allow there?

A. On the depreciation annuity?

Q. Yes.

A. Oh various rates depending on the life of the -quipment.

Q. What was your sinking fund basis, you proceed to start and how did you work it out, what rate of interest is the sinking fund supposed to bear?

A. The sinking fund I have, the sinking method I used in arriving at the depreciation annuity and only that.

Q. Isn't that supposed to b-ar a certain rate of interest?

A. What?

Q. This sinking fund.

A. Supposed to bear a certain rate of interest for certain kinds of equipment.

Q. Give us one for an illustration.

A. If the equipment has a life of fifty years and you want to determine the annuity which will necessarily be laid aside
1210 each year annually compounded at a given rate of interest to give you at the end of the fifty period that amount which you are to recover, then you would have one rate of interest. For another period to which you are to compound annually will be another rate because the life of the equipment which you are providing for will determine the rate which you can net on this fund.

Q. In this rather extended explanation when you use the term given rate of interest what do you mean?

A. Specific rate of interest.

Q. What was it, how much?

A. For what life?

Q. The life you had in mind when you gave the illustration.

A. I said fifty years.

Q. Well fifty years.

A. You want the rate I have used on the fifty year life is that it?

Q. Yes.

A. Three per cent.

Q. Now taking your building there for instance, the first building and what is the sinking fund there, the amount you say should be set aside?

A. Building No. 1 "A" and "B" depreciation annuity on sinking fund basis is $105.

Q. Now then what rate of interest should that amount bear to work out your proposition.

A. Three per cent compounded annually.

Q. Now the next building there?

A. The next building is thirty years.

Q. What per cent would that sinking fund draw in order
1211 to work out your proposition?

A. Three and one fourth per cent.

Q. Didn't you understand that was what I was trying to get at in the first place?

A. I was trying to answer your question as yo- gave it.

Q. And in all other places where you have tried to account for the loss of interest in arriving at your reproduction value you used the rate of six per cent.

A. No, sir. I used 6 per cent where I arrive at the amount of loss of interest during construction, but that is a radically different character from this, from a depreciation annuity, cannot be treated the same way.

Q. (Question read.) I am not asking whether it would be the same thing or whether the same rate would be used?

A. You said all other places. There are no other places. This is not parallel to the six per cent case referred to, this is not another of the same kind.

Q. In what instances have you figured interest at six per cent in your report?

A. In this report you are speaking of?

Q. Yes.

A. Wherever there has been loss of interest during construction it has been figured at the rate of sic per cent per year on such amounts as have been invested for the full year. If an amount has been invested for less than a full year, it has been treated proportionately.

Q. What was the reconstruction cost of that second building.

A. The total reproduction cost of building No. 1 C is $155.

Q. What is its present value according to your report?

A. $127.

1212 Q. Take the buildings altogether to sho-ten this up, what was the reproduction cost of all the buildings?

A. The total reproduction cost of all buildings $106,934.

Q. And what have you made their present value according to your figures?

A. Present value of all buildings, $82,445.

Q. And some of these buildings were constructed as early as 1876 as I remember it?

A. The oldest building is thityy five years old.

Q. The large holder down there, when -as it put up do you know?

A. It was erected in 1903.

Q. That is the largest one?

A. That is the million foot holder.

Q. Do you know what it cost the company when it was put in?

A. No, sir.

Q. Did you make any effort to see?

A. No, sir.

Q. You didn't care anything about that in arriving at your valuation.

A. No.

Q. What is your reconstruction cost?

A. The tota- reproduction cost of storage holder No. 20 is $137,988.

Q. That is the total reproduction cost?

A. Total reproduction cost.

Q. In that is all these so-called overhead charges and the interest and taxes?

A. All of the items that I have indicated are included here.

Q. That includes taxes and interest?

A. That includes taxes during construction, loss of interest during construction and the 15 per cent for engineering, casualty liability omissions and contingencies.

1213 Q. If the company had purchased—and I ask this for the purpose of bringing your theory out clearly,—if the company had purchased that holder new for say $50,000 and you had had that information would that make any difference with your valuation.

A. It would not unless $50,000 happened to be the average price of holders of that kind which I know is not the case.

Q. You were not paying any attention to what was actually paid fo- property here upon any of these items were you?

A. No, sir.

Q. You didn't regard that as a necessary element at all in arriv- in- at the value?

A. No, sir; I never use it.

Q. That is the notion I got from your theory. That is to say now your valuation rests upon your judgment as to what it would cost now to reproduce all this property without reference to what it might sell or what the company bought it for or what they could buy it for?

A. I can't answer that without an explanation.

Q. Well I will take your explanation this time.

A. My estimate of the reproduction cost of the physical property of the company is not based upon the cost to the company as shown by the books. It refers to my own estimate of what it would cost

at this time to reproduce property of this kind and quantity as shown in my table of total reproduction costs.

Q. Is there a market value for that kind of a holder?

A. As it stands down here you mean?

Q. Yes.

A. There might possibly be someone else who would be willing to take it and handle it for you.

1214 Q. Is there a market value to that holder?

Mr. GUERNSEY: Probably he don't just understand what you mean by market value.

Q. Is there a market value for that kind of a holder?

A. Certainly.

Q. What is the market value of that kind of a holder?

A. Erected in Des Moines $137,988.

Q. I am not asking your reproduction cost, I want to know what the market value is.

A. Is what I base my cost on.

Q. Do you know of another one like it?

A. Perhaps not like it, I don't know *whether* another holder having 1,132,000 cubic feet capacity perhaps.

Q. Then it does not have a fixed market value?

A. It certainly does.

Q. Who fixes it?

A. I don't know who fixes it.

Q. You don't know of any market value put on that except the one you put on?

A. Not talking of this specific holder I understand.

Q. Or any holder like it?

A. Now what you mean to ask is was there a market value of holders?

Q. To establish the market value or how was it established on this holder?

A. The only way any market value is which I presume to be the operation of the laws of supply and demand.

Q. Was there any other market value other than what you gave?

A. What do you mean by the question, I don't get it.

Q. You don't understand the question?

A. No.

1215 Q. If you were to be asked tomorrow by some client what holders like that were seeling for on the market what would you say to him?

A. I would not say this amount of course. That is not the sale *pr* price, that is not the contractor's price.

Q. What would you say?

A. I would say if you want to know what that holder costs when erected——

Q. No if he asked you what the market price was?

A. Go figure up the construction cost and give it.

Q. Tell him it would be worth the construction cost?

A. No tell him if he wanted a holder like that under conditions similar to Des Moines that would be the net construction cost.

Q. Then it has to be worked out here in Des Moines and apply to conditions and prices here?

A. Obviously.

Q. And is that the way you work this out?

A. It is.

Q. Now then if this gas company purchased that holder here in Des Moines, been bought and set here for a fixed price wouldn't that have something to do with the market price of such a holder here in Des Moines?

A. Make that a little more clear.

Q. (Question read.)

A. Are you asking whether the price paid by the Des Moines Gas Co.——

COURT: Just answer the question.

A. I can't answer his question Judge.

Q. If it should appear that the Des Moines Gas Co. went into the open market, bought the material, whatever is necessary to
1216 go into that holder, paid for the labor that was necessary to construct it, and paid for every item that was necessary to make a complete holder and then the sum total of all these expenditures was 50 per cent less than you had in your figures and you had known that in advance of making up your statement here, would it have made any difference with the valuation?

A. No, sir.

Q. You would not have paid any attention to that?

A. I would not.

Q. That would not have affected the value as far as you are concerned?

A. That would have been an abnormal condition, I would not have considered it.

Q. I wish you would give us the tables you used in determining the average investment age?

A. You will find them in the report.

Q. Tell us where we can find them?

A. Immediately following the double sheets in Exhibit "D." The sheets labeled average of mains, average services, average age meters, the three sheets immediately preceding the blank sheet with the letter "E" fastened to it.

Q. Turning to your meter table, on page 12. You have figures out there the average age of meters to be 8.27. The figures from which you got finally that result appear in this table do they not? You take the life of each meter in years as you determine it or fraction of years as the case may be, and then you take the total number of meters in use each year from 1886 to 1910 and then you add the sum total of the figures in the last column and the sum total of the figures in the third column, and divided the larger num-
1217 ber by the smaller and got 8.27. That is the way you arrive at that?

A. That is the average of meters on the installation basis.

Q. Now then below that you say average of meters on investment basis, 7.7. Now how do you get that?

A. Same scheme.
Q. Well give us the figures. Where could you find the figures?
A. They are not here.
Q. I asked you for them yesterday or day before. Have you made any effort to get them for me?
A. No, sir.
Q. Where are they?
A. I don't know.
Q. Are they at Chicago?
A. I can tell you how I arrived at that result if that is what you want.
Q. Where are the figures?
A. I don't know.
Q. Do you have the memorandum in Chicago?
A. I believe I had it there once.
Q. Is it there now?
A. I don't know.
Q. Which of these average ages did you use in the final computation?
A. The only one you could consistently use which is the investment basis figure.
Q. The one we don't have the figures here for so that we can check.
A. That happens to be so but you can easily check it.
Q. Will you furnish us the figures from which you worked this item 7.7.
1218 A. I will if I can find them.
Q. You stated a moment ago we could easily check it?
A. Very readily.
Q. How do we do that without the figures?
A. By using your own unit numbers on meters if you know those units to be correct. Get the unit prices and they work out from that
Q. I want to get Mr. Lea, you furnished this table here and I would like to have you furnish the figures by which you worked out this 7.7, and you will be expected to furnish them before we are through with you as a witness. How did you get at the age of these meters?
A. From the records of the company.
Q. Who furnished you the memorandum?
A. I don't remember.
Q. Where is that memorandum?
A. I don't know.
Q. Do you have it in your office at Chicago?
A. I think so.
Q. You used the memorandum as the basis of these tables didn't you.
A. This total was made from these figures, I don't know whether in my office or not.
Q. If we wanted to determine the accuracy of your figures from the memorandum you used to make them we would have to have that memorandum wouldn't we?
A. No, indeed you would not. All you would have to have would be one of the books that was in court a few days ago.

Q. That would show the whole business?

A. That would show you all the material from which these tables are built.

Q. So you assume to state that the memorandum that was
1219 sent to you is exactly the same as the memorandum we would find with the book here in court?

A. I didn't say that.

Q. Did you ever examine the book, check it up with the memorandum you had?

A. No.

Q. So you don't know anything abo-t that you just assume the book will show exactly what the memorandum was?

A. I know exactly what I said, it was that in that book you will find all the material needed in building up this table as to the numbers of meters.

Q. Would we know how to figure it out?

A. I didn't say you would know how.

Q. The memorandum with respect to these meters was a part of the memorandum and data that was furnished by the gas company?

A. Yes, sir.

Q. For your purposes and from that memorandum and data as far as it was available, as far as you had it, you made up these tables of figures?

A. Which tables are you referring to now?

Q. All of them that appear in your Exhibit 20.

A. You will have to be more specific, I can't answer that broadcast.

Q. All of them on page 12?

A. That is the page age of meters?

Q. Yes.

A. The data on the sheet labeled average of meters showing years, total number of meters end of year, number of meters installed during year and years in service, all these figures were obtained from the records of the gas company.

1220 COURT: You didn't examine the records of that?

A. No, sir.

COURT: You don't know whether they have them or not?

A. No, I don't know whether they had 1970 meters but I took it for granted they did.

COURT: Just assumed that?

A. Yes, sir.

Q. There was a memorandum furnished you, I don't care whether it was the records of the company whether they got it from the books or where they got it, but the memorandum from which you worked out these tables especially the one on page one of Exhibit 20 and the one on page 11 of the same exhibit and the one on page *of* ten of the same exhibit were furnished you by the Des Moines Gas Co?

A. They were.

Q. Now turning to page 11, I notice there that you have used a little different method in arriving at the average age and the fourth column instead of being total service years as the other is total meter

years, you say total dollar years. Now just how did you — at this total dollar years?

A. Multiplying dollars shown in the second column by the years shown in the third.

Q. That is you took first the item there, 1910, that is in the first column, in the second column is the item 18,579. Now what does that represent?

A. That represents the estimate made by somebody of the cost of putting those services in the ground.

Q. And furnished to you in the form of a memorandum?

A. Just as you see it here.

Q. Somebody furnished it to you just as it is here?

1221 A. Yes, sir.

Q. Originally?

A. Yes, sir.

Q. They didn't furnish you this sheet?

A. Not that particular sheet.

Q. Nor these figures?

Q. Not this particular piece of paper no.

Q. But did furnish you another piece of paper upon which these figures appear?

A. Yes, sir. These are not my figures, I have not been governed by these figures in any extent.

Q. You understood the company was furnishing these figures to you as figures that could be found on their book records?

A. No, sir.

Q. What did you understand?

A. I understood these figures were not made from anything on the books but they were arrived at by using certain units which one of the engineers of the company had selected.

Q. What units do you mean?

A. Units as to price. I don't know what units we used nor anything about that and I didn't accept them. The calculation is correct for the purpose——

Q. Why did you offer them here if you didn't accept them?

A. Because this is not a table used for valuation, this is a table used in arriving at age of the services. It shows that even with any number of dollars in this column so long as the ratio between the units for different sizes be correct, that ratio may be made up with figures twice too high or fifty per cent of what it should be.

As long as the ratio is maintained you get correct figure in

1222 years.

Q. Then this table don't represent anything in the way of existing facts or figures as it appears here?

A. Not to my knowledge it don't represent anything concerning value as far as I know.

Q. They are of no importance?

A. I never so considered it. That table is but a method of arrivin- at the age.

Q. You didn't arrive at the age, investment age of the services on

page 11 in the same way you arrived at the investment age on page 12 did you?

A. The same way, yes.

Q. Exactly the same way?

A. Exactly the same way.

Q. You had figures furnished by somebody else?

A. I didn't use the figures. I used figures for the method of calculating the composite age all I wanted was the composite age.

Q. Page 12, these figures and that computation was made upon figures that were taken off here as I understand?

A. They have been here but they are not *n*ere now I believe. They may be in some of these records now, I am not sure.

Q. Turning to page 10 is another table somewhat similar to the tables we have just been using. In this table you proceed on the installation basis alone do you?

A. The conclusion shown here is on the installation basis but the investment basis calculation wa- made also.

Q. And that was worked out at the time this report was made was it?

A. I don't remember the time at which it was made.

Q. Well during the time this report was in preparation.

1223 A. It was before I came to work out the depreciation in my report I know.

Q. Now where are the figures and memorandum from which you made the table that appears here on page 10 with respect to the investment age.

A. I don't know.

Q. You filed them with your other memoranda and paper at Chicago?

A. I presume they are in my office.

Q. Anyway they are not here?

A. They are not here.

Mr. BYERS: We would like to have the witness directed to produce the memoranda and figures upon which the table as it appears here on page 10 or rather the average investment age was figured out and -rrived at as shown here on page 10 and also on page 12, so that we can have them before the witness is excused.

COURT: If you can produce them I wish you would do it. If the compilation made was incorrect, that of course would bring incorrect results.

Mr. GUERNSEY: I may say in this connection we expect to prove the correctness of it before we get through.

COURT: If you can do so I would like to have you produce them. I mean the memoranda that was furnished you.

A. This is a copy of the memoranda that was furnished me. The one I got is the original from which I copied this showing how the age was arrived at.

COURT: Well get it if possible because figures are like logic you know, if you start wrong you will be wrong yourself.

Q. You stated this morning or yesterday, at least some time during

several days that you have been with us that it would require a million dollars to cover new construction during the next
1224 seven years. I wish you would itemize that for us.

A. I arrived at that figure by using units, we consider large portions of the plant as a whole and I can't itemize that without a great deal of time. I will have to detail that if you want it itemized.

Q. What was your idea in stating it?

A. I know the figure carried as a full capacity unit.

Q. But how are we going to know?

A. I don't know how you are going to know.

Q. Not even the Master could know that?

A. Yes, we can provide him with all details.

Q. But you have not done that?

A. No.

Q. Well I wish you would — that too before you are excused. There is no way that can be done now is there?

A. No.

COURT: Where did you get this?

A. I have the lump sums which I used.

COURT: Have you got the details of this?

A. Oh no, I would have to work it out in detail, work up this machine and work up that, what the additional would be and sized building you would have to have. Aside from that we know from experience the grand total figure per thousand feet of gas made, what that would be. This is extensions necessary to take care of the business which this company will doubtless take in addition to what it now has within the next seven years. Seven years from now this plant will have to be bigger than now. Mr. Byers is asking now how much money will this company have to put into additions to the plant in the next seven years. I can give you lump sums on that which are based on unit cost per thousand feet *feet*
1225 of gas making capacity but can't give it to you in detail witho-t an awful lot of work.

Q. You worked that out to some extent in your mind?

A. Why yes.

Q. Give us as near as you can in a general way the principal items that have to be used.

A. I seem to have left that in my room. I thought I had it here, but it is not here. I did work it out some days ago and arrived at something over a million dollars. I can find it in my room.

Q. We will take it up at some other time. In reaching your average of meters on page 12, Exhibit "D" of Exhibit 20, you give 1261 meters as having seen 29.1 years of service. Is that the actual years of service of that many of the meters or is that simply an arbitrary number that was used to work out your age basis.

A. That is not the average number of years. That 29.1 you will notice gives 1261 meters which were in use at the end of the year 1886. Prior to the year 1886 the records do not show the number of meters used per year. Consequently from the records as they did exist back to 1886 a curve was plotted and then the curve was

extended back to 1864 as the most correct method of determining how many meters had been installed at the end of each of the several years covered and it was found of course that there were more meters added per year during the end of the period than at the beginning the result being that the composite age of the whole 1261 was as shown here but not one of these meters that had been in use 29 years.

Q. What I want to know is whether there figures are to be taken as representing 1261 meters that had been in service for 29.1 years?

A. Certainly not, and I just was explaining it to you.

1226 Q. What you do claim is that they had been in service an average of 29.1 years?

A. That is not what I claim.

Q. Neither of these things are true?

A. No, sir.

Q. What do you claim?

A. Just as I have expressed it. This is the composite average.

COURT: Composite is what you call true average?

A. That is the true average. Of course that don't mean 1261 meters have been in 29 years each. Meters don't last 29 years.

Q. That is what I was trying to get at.

A. A much simpler way of getting it.

Q. The same is true as to 1304 meters there that you use the term 23 years, is that right?

A. It is not.

Q. Well does it mean that they have been in service 23 years?

A. It does not. It does not mean 1304 individual meters have been in use 23 years.

Q. What does it mean?

A. Means at the end of 1887 there were in use 1304 meters. Of course these meters have been replaced from time to time as individual meters.

Q. Well then haven't you instead of getting the age of the meters there haven't you got the age of the service and connections?

A. No.

Q. Isn't that — you have done?

A. No, sir.

Q. How did you get the basis for these figures for this composite average you tell about?

A. I have explained as fully as I can.

1227 Q. Wasn't that done as you said here a few days ago by examining the record showing the meters that were in service?

A. It was obtained exactly as I said it was obtained and in no other way.

Q. And how was that?

A. The record will show, I have forgotten the wording.

Q. Who furnished the information to you?

A. The gas company.

Q. And in what form did they furnish it?

A. The form you have it there.

Q. What do you mean by the form I have it?

A. Just that.

Q. I haven't it in any form?

A. The report is in your hand isn't it?

Q. I will put that question in another way. Was this information furnished to you by the gas company in the form of a memorandum other than the memorandum you have set out here in your report.

A. It was furnished to me on a piece of paper which is not the pi-ce of paper in my report, but the form in which the information was arranged and the facts stated in the information given me are as shown in my report.

Q. Im other words this is what you claim to be a copy of what somebody else furnished you?

A. Copy of the record taken from the books of the company.

Q. Did you see it taken from the books of the company?

A. I did not.

Q. How do you know it was taken from the books of the company?

A. I believe the man that told me it was from the records.

Q. How do you know it was?

A. I don't know it.

1228 Q. All you know is it was furnished by some individual. Who furnished it?

A. I don't know what individual furnished it to me.

Q. Doesn't this table show the average age of the installation meters rather than the average age of the meters?

A. It does not.

Q. Turn to page 12 Mr. Witness of your exhibit 20 in the third column near the bottom under the heading No. of meters installed during the year, the figure 17 appears opposite the year 1889, and opposite the figure- No. 2338. Now were there 17 meters now in use, installed and in use that were installed and in use in 1889?

A. That sheet does not say they were.

Q. That is not the question I asked you?

A. I don't know.

Q. Did you assume that?

A. I assumed this table to be correct.

Q. Then you assume there were seventeen m-ters in use now that were in use in 1889?

A. I did not.

Q. Well what did you asume to be correct with respect to that?

A. That of the total number of meters now in use it is fair to say that a p-oportion represented by seventeen meters has been in use for a period of twenty one years and nothing else.

Q. You mean then seventeen of the present m-ters?

A. I didn't say that.

Q. Did you mean by that that any one of these meters have been in use for twenty one years?

A. It is possible some one of these meters has been in use
1229 for twenty one years.

Q. How many do you assume have been in use?

A. Of no interest to me how many had been in use. I want to know the composite age, not the individual age of each meter.

Q. You have to have something to start with?

A. I have it right here.

Q. You didn't start with this only, this is only a memorandum.

A. No, this table was made from the records, but this is all I need.

Q. Take the one above where it says number of meters installed, third column, 200 opposite the year 1890 and total number of meters, 1538. Does that represent or intend to represent that there were 200 of the meters that had been installed during that year and now in use, hadve been in use since 1890?

A. Certainly not.

Q. You have the same answer for that, as you had to the seventeen?

A. Exactly.

Q. And the same as to all of these?

A. To all the others.

Q. I wish you would explain just a little further for me—I don't seem to get that through my head very clearly,—just the ourpose of this table and what was accomplished by it, how it can be used to test and check up any part of your report?

A. The meters used by this company are of various sizes. Each year there is installation of a number of meters, but in that number there is a varying proportion of the different sizes of meters. A compilation and record showing the actual number of five light meters installed during the year 1886, together with the number of three light meters that same year and all the other sizes tahat may have been installed that year and maintain a record of each
1230 individual meter up to the present time showing how often it has been repaired or renewed or replaced entirely would involve an amount of work that is beyond all reason. The practical way of arriving at the composite life of the meters in any plant is to make a table like this having as a foundation the total number of meters in use. Now the number put in in a given year as I said before has always various sizes and the best you can do is to strike an average for all of these years as to the ratio of one size of meter to the other sizes installed in a given year. That is fair to all concerned and it is found to be correct in practice. Now then having determined the total number of meters gained during each of a given number of years and having assumed that you are taking an average size of meter which you have to do as I have explained then this table does show that with the number of meters installed in a given year may be found the percentage of the total number which the meters installed that year represent. That is all that table shows as far as that second column is concerned.

Q. I know, but now after you have done all that what have you accomplished?

A. When you get through with the rest of the calculations you have determined the composite age.

Q. To come back to the seventeen, you are trying to figure out the socalled installation age of the meters and you start in that column with the year 1889 and the number 1338 and then 17. Now that number 17 is the basic number for your computation as to the years to go into your year column isn't it?

A. Yes, sir.

Q. Now you get it into your year column by multiplying 17 which is in the meter column by 21?

1231 A. Yes, sir.

Q. Which is the years in service and you get a result of 357. In other words the years of the seventeen meters that have been in service as this service would indicate at least to a novice for twenty one years made the total of years to go into your years column of 357 and the same is true of your 200 just above seventeen; you take the year 1890 and take the number of meters 1538, the total number of meters and then you take 200 as designating the number to count in your years and multiply it by twenty do you not and you get four thousand?

A. Yes, sir.

Q. And then that column you continue that way until you get the total number of meter years and then divide it by the total number of meters installed, that is the way you get your installment age?

A. No, sir.

Q. I mean the average age?

A. No, sir. Divide it by the total number of meters installed.

Q. That is what I said isn't it?

A. Beg your pardon, I thought you said in stock.

Q. Supposing during these periods one third of these meters had gone into the scrap heap and other meters taken their places would that make any difference in your table?

A. This table is based on the record shown on the number of meters installed, this has nothing to do with the determination of the rate of depreciation to meters, I show the number of years as a composite age of the whole number of meters.

Q. It has little to do with any part of the real bases of your valuation here?

1232 A. It has a very important bearing — the number of years composite age of the meters is a very important item, but this table has nothing to do with the rate of depreciation to be allowed because of the scrappage of meters.

COURT: On page 9 you give the average age 7.7 of the meters?

A. Yes, sir.

COURT: Life twenty five years.

A. Yes, si-.

COURT: And per cent condition 80 per cent.

A. Per cent condition, that is the condition a meter of that average would be in.

COURT: You add the same taxes and per cent of interest to that

A. Not the same per cent of interest while constructing that part of the system.

COURT: You add the 15 per cent to that.

A. Yes, have to add 15 per cent.

Q. How much of a meter aside from the shell can be used without removing for more than ten years?

A. Very often all of it except the diaphragm.

Q. How much of it can be used for more than fifteen years?

A. Same answer.

Q. Nearly all of it except the diaphragm?

A. Very often that is the case I said.

Q. What would you say is the avarage age?

A. Can you make that more specific. The average time that elapses before the meter needs repairing of any kind?

Q. No, before any part of it cannot be used except the shell without renewal.

A. I would have to refer to detail records to give you the average life before each of the many kinds of repairs become necessary. The figure used here is only my indication as twenty five years'
1233 life for a meter as a whole?

Q. You can't answer the question as put to you?

A. Not without further details in my office.

Q. What is the value of the shell of a five light meter?

A. The shell alone?

Q. Put a value on it.

A. I don't know.

Q. What is the value of a ten lighter meter, the shell alone?

A. I don't try to keep those prices in my head.

Q. You don't know?

A. I have records, but I don't keep them in my mind.

Q. Have you got it here?

A. I am not sure that I have*m* I will see. I have not the detail here as to the cost of the shell alone.

Q. After the completion of your report as to the value of this property, the physical property, what per cent condition did you finally leave it in?

A. What portion of the property do you refer to?

Q. The physical property.

A. All of it except the real estate.

Q. Yes.

A. That is shown in Exhibit "D."

Q. 85.3?

A. 85.3 is the present per cent condition of the total physical equipment of the Des Moines Gas Company excepting its real estate.

Q. And *is* your computation and your reproduction on the theory and basis on which you figure it out would represent a condition of 85.3.

A. Figured on a basis that requires certain conditions as
1234 standard that is the per cent condition of this plant today.

Q. I wish you would answer that question as put?

A. 85.3 is the composite per cent condition of the total physical property except real estate of the Des Moines Gas Company.

(Question read.)

A. You haven't asked me a question if you want to take it technically.

Q. Give me yes or no.

A. I can't.

Q. We are dealing alone with your report, your figures and as you have valued this property and worked it out in this report, Exhibit 20 you live it in an 85.3 per cent condition?

A. Yes, sir.

Q. Working capital you cover in your report, is that for the purpose of construction or operation?

A. That is the amount you require when you get into operation on the present scale.

Q. Any part of it for construction?

A. A portion of it has been used—if you mean in the calculation for the hypothetical plant?

Q. Yes.

A. The report shows how fast I have assumed this money to be required.

Q. Part of it you use up in construction?

A. No, sir; I have not used it up, it has been used in connection with construction.

Q. Part of it used?

A. Part of it necessarily used in connection with construction. It was not as an investment.

1235 Q. And part of it in operation.

A. Part of it used until the plant was in operation.

Q. It was used in operation?

A. It became necessary when the plant got in operation to use additional working capital.

Q. If any part of it was used for operation how would that affect your taxes and interest proposition.

A. If it was used for operation it was not working capital.

Q. You have just said part of it would be used in operation?

A. No, sir; I said when you began to build this plant in addition to the costs shown by material and labor and the other items entering into construction costs you have got to have certain ready cash with which to work. I show in my reproduction chart how fast you would have to accumulate this working capital. When you have acquired a business equal in extent to tha- of the present Des Moines Gas Company it will amount to the figure I have shown here as a total.

Q. As you have figured it out have you provided the amount of working capital that is set forth here simply for construction?

A. Certainly not. It is not so shown.

Q. How much of it is for construction?

A. None of it permanently for construction.

Q. Turning to page 3 where you have your working capital you have an item down at the bottom there loss of interest during construction?

A. Yes, sir.

Q. That is loss of interest on this capital that is to be used in operation but is held during construction, is that the idea?

1236 A. No, sir. If you will look at my reproduction expenditure there you will see exactly what it covers. During the year 1911 the hypothetical plant would have to have in my opinion working capital of $22,000. During the following year $40,000 additional would have to be installed. The following year $80,000 additional would have to be provided and throughout that period you have been accumulating taxes during the construction period chargeable to the money which is going into this working capital fund and which appears at the end of -he construction as working capital for the operating plant. It is the amount of money that goes into construction or into part of it that constitutes liquid assets necessarily used in the conduct of the business consyruction and operation.

Q. Finally all go to be used in operation then?

A. Certainly not.

Q. What portion?

A. The money used in operation is spent in operation.

Q. What portion of this money is set asid- finally to be used in operation?

A. I suppose every particular dollar of this fund may go into operation, but if so it is replaced by another dollar. This fund as a fund is retained intact.

Q. All used in operation?

A. Certainly. In the conduct of the operation of manufacture and distribution.

Q. Turning to your working capital again I wish you would explain a little more fully the item $39,607.29, why that is included and what your notion about it is?

A. That is not included.

Q. It is not included?

A. Certainly not. That is an item which must necessarily be deducted from the gross working capital.

1237 Q. I don't care what you do with it, you take it off of this total $181,377.29. What I want to know is why you used that item in that statement at all?

A. Because I want to know what the net working capital is. I don't care about the gross.

Q. You get at that by deducting the accounts payable out of the gross working capital?

A. Get at the net working capital.

Q. Do these accounfts that you have used here include the average carried liabilities through the year on pay rolls and taxes and insurance water rent, and so on?

A. What item are you referring to?

Q. $39,607.

A. That covers all accounts payable of whatever nature so long as they relate directly to the business of manufacturing or distributing gas in the city of Des Moines.

Q. Does it include any thing that has not already appeared on the books accrued liabilities of any kind?

A. You will find in the standard classification of the American Gaslight Association what items it covers?

Q. That is not what I asked you.

A. I don't remember the items.

Q. This item $40,201.89 I wish you would explain that to the Master why it is, in what way found in Exhibit 20?

A. That is the total value at the time of taking this inventory of all working supplies in the store room.

Q. Was that just what was on hand at that time?

A. Yes, sir.

Q. You didn't then try to get the average stock that was carried through the year, you just took what was on hand the first

1238 day of January.

A. Well I had seen the stock and I drew the impression that was a reasonable amount of stock, presented a fairly average amount of stock.

Q. I didn't ask you that. I simply wanted to know if you took the amount that was on hand the 1st day of January 1911.

A. Yes, sir.

Q. Do you know the average monthly sales being made?

A. Of what?

Q. The stock?

A. Don't sell stock.

Q. Don't sell it at all?

A. All of it, a lot of that is pipe.

Q. What they do sell do you know what the average monthly sales are?

A. No, I don't. I have seen some figures on that, but I don't remember.

Q. Do you know what the average monthly consumption of this material stock and all is.

A. By the company you mean?

Q. By the company.

A. No.

Q. How much generator fuel stock is included in the item $10,449.98?

A. I have not the detail here.

Q. Have you it anywhere?

A. I had it I believe in my office.

Q. It is with this memorandum I have several times asked for.

A. I presume so.

Q. You will produce it?

A. If I can.

1239 Q. Do you know what the average consumption of generator fuel stock is?

A. Not off hand. I have memorandum whowing what it is.

Q. That is with this memorandum?

A. Yes, sir.

Q. How much oil is represented by the item $9,301.81?

A. I don't remember the number of gallons.
Q. You don't remember anything about details about that?
A. No, I do not.
Q. You have the figures with this memorandum?
A. I believe so.
Q. Do you know what the average monthly consumption of oil is?
A. No, I don't remember the amount.
Q. Does your memorandum show that?
A. I think so, I have a memorandum or have had one showing it.
Q. Did you make any comparison of the average used to determine whether or not the first day of January was typical of the year or not?
A. I made a calculation showing that it was a very reasonable amount of oil to carry in stock in a place located as this is.
Q. That is not quite an answer.
A. I made such an average, yes.
Q. Do you know what the average amount of all the material and supplies on hand wa- during the last four years, the average amount they have carried?
A. No, I do not.
Q. Did you have any figures showing that?
A. I don't believe I had any figures showing that item for the years back. That naturally varies with the growth of the plant.
Q. On the first day of January 1911 you estimate in your
1240 statement here cash items $49,434.15. Did you make any investigation or comparison with other years on that, the cash the first of the year?
A. I have seen statements for other years that make this look reasonable.
Q. Whose statement?
A. Statements of the Des Moines Gas Company.
Q. Furnished to you?
A. Yes, sir.
Q. Are they with these memoranda that you have in your office?
A. I don't remember.
Q. You filed it away didn't you?
A. I presume they are there, but I don't remember that. That is not the kind of information I would file very carefully.
Q. How much of this $49,434.15 was drawing interest or do you figure as having drawn any interest?
A. I don't know whether any part of it was. I believe it was all held for quick work and the interest on it would be a negligible amount.
Q. At any rate you have not given the other side of the account credit for interest on that?
A. For the reason they might very readily carry a larger sum of cash than that and still be within the reasonable practice.
Q. At any rate you have not taken into consideration the interest pn that.
A. No, I have not.
Q. If it should turn out to be a fact that your allo-ance for real

estate, $259,000 odd dollars aside from the improvements and the organization and legal expenses, $68,023 a total of $327,678 is $5000 in amount larger than the entire investment in the plant for all purposes up to June 30, 1888 after this property had been in operation 12 years, would that have anything to do with your figures?

1241

A. Of course not.

Q. What is the latest important piece of construction by the gas company?

A. I believe the 10 foot six water gas set, I believe was the latest important extension made at the plant.

Q. And when was that?

A. About 1909 or '10. It is two years old now.

COURT: That is the first they used water gas?

A. No, this is the biggest machine they have. They had four machines before that.

Q. When do you say they got that?

A. Within two years.

Q. Do you know what it cost the company?

A. No, sir.

Q. Did you make any inquiry to find out?

A. No, sir.

Q. Don't you think that would have helped you some?

A. Not the slightest.

Q. You would have had placed the same valuation on it if you had known that the company bought it for 25 per cent less, bought it in the open market for 25 per cent less than you have given credit for it in your computation?

A. I would.

Q. And knowing too that your proposed valuation was to be urged upon the Master in this case for rate making purposes.

A. Yes, sir.

Q. Now what other important piece of construction have they made within the last three years that you know of.

1242

A. Well they have been doing a great deal of street work, running mains and services and meters, setting meters.

Q. Give us some one important thing that amounts to enough to bother with it now?

A. Well take the oil tanks No. 24 and 25, the two large oil tanks over by themselves.

Q. When were they constructed?

A. Within the last two years.

Q. So undoubtedly every single item of expenditure on the part of this company in connection with these two tanks appears on the company's books does it not?

A. I don't know.

Q. Well you have not hesitated heretofore to say all these other things appeared on the company's books?

A. I have not said all these other things, I specified the things of which I have knowledge.

Q. Did you make any inquiry to find out?

A. No, sir.

Q. You didn't ask the gas company or any individual in connection with it what it costs the company to put in these tanks?

A. I should have been greatly surprised if I should have found it on the books.

Q. That is not an answer.

A. I didn't ask them.

Q. You didn't ask the company or anybody else how much it cost to make the excavation there?

A. No, sir; not as to that particular excavation.

Q. I mean as to that.

A. No.

1243 Q. You didn't make any inquiry of anybody to ascertain how much the contr-ctor received for the brick work?

A. No, I made general inquiries as to the cost of brick work in Des Moines.

Q. I am not asking about general inquiries, talking about this particular construction now of thes- two tanks?

A. No, sir.

Q. You didn't make any inquiry of anybody either contractors or the company to ascertain how much the company paid for the steel work that is there.

A. No, sir.

Q. Steel construction. Then for both of these tanks as I understand your answers they were put in there within the last two years?

A. They were within the last two years according to the record.

Q. Now what do you credit for these two tanks on your computation?

A. The reproduction cost total $20,500.

Q. That is for both of them?

A. Yes, sir.

Q. Now if it should turn out that the gas company or to put it in another way the total expenditure of the Des Moines Gas Co., upon these two tanks covering every item of labor and material and construction on both of them was say, $12,500 would that make any difference with your estimate of the reproduction cost or value of them?

A. Not the slightest.

Q. Then why did you ask anybody in Des Moines brick men or carpenters or excavation men or anybody else about prices of work in Des Moines?

A. Because I have to arrive at units.

1244 Q. I know, but why didn't you try to arrive at some of your units by ascertaining with respect to some definite piece of work like the Des Moines Gas Company work.

A. Because I have made estimates, I have considered so many pieces of work of so many kinds and so many places when I determine in my own mind the reasonable units I am willing to stand on my own prices.

Q. There is a lot of brick work in those two tanks.

A. Quite a bit.

Q. You took Mr. Mardis' work and went to two other contractors?

A. I didn't say I did.

Q. You said something about Mr. Mardis?

A. Yes, I said he was one of the contractors who provided lists of unit prices to the gas company and which list I have seen.

Q. When you got Mr. Mardis' statement of figures whatever they were as to brick work in Des Moines, if you had gone to the Des Moines Gas Company after you got Mr. Mardis' statement as to the brick work and the Des Moines Gas Company had told you that they went into the open market and had the brick work done down there in these two tank erections there for $12.50 a thousand, which figure would you have taken in trying to work out a fair value of this property, what the gas company told you they -ctually paid for the work or what somebody had told you was the usual price in the city of Des Moines?

A. I didn't ask the gas company what they paid. What the gas company would say it had paid would not have effected my valuation in the slightest.

Q. You would rather have somebody state as to his opinion what the general prices or ordinary prices had been in Des Moines for brick work, that would weigh more with you would it than
1245 the actual expense of putting up brick work itself, that is your idea?

A. That is not my statement nor my idea. When I am to make a valuation of a plant I do not want to——

COURT: Just answer the question and stop.

A. I can't answer without explaining.

Q. The Des Moines Gas Company built a building down there just a short time ago didn't they?

A. Yes, building No. 7 is comparatively new.

Q. When was it built?

A. Within the past two years.

Q. In that building what did you allow for brick work?

A. Well I can give you the net construction cost on brick work. I have got it all, but you don't want the reproduction tota-.

Q. No, I want the net construction cost of the brick work.

A. I have the brick in the walls at $17.00.

Q. $17 a thousand?

A. Yes, sir.

Q. How many thousand were there?

A. 112,698.

Q. That building was erected within you say two years?

A. Yes, sir.

Q. I suppose soon after you came here you went down to the plant?

A. Yes, sir.

Q. And you began immediately to get your information with respect to local conditions and local prices?

A. Yes, sir.

Q. You observed when you were down there that this building was of very recent construction didn't you?

A. Yes, sir.

1246 Q. You knew or naturally must have known the gas company had had it erected within very recent years?

A. Yes, sir.

Q. Now did you make any inquiry of anybody in connection with the gas company to see what they paid the contractor that laid these brick?

A. No, sir.

Q. Did you make any effort to find the contractor who did the work?

A. No, sir.

Q. Now if you had made that inquiry and the gas company had inform- you that that work was done here by brick masons in Des Moines for $12.50 a thousand, would that have helped you any?

A. No. sir.

Q. Have you figured out the per cent that your overhead charges bear to the entire cost?

A. No, but I can give it to you very readily here. By overhead you mean total engineering, casualty liability, omissions and contingencies, loss of interest during construction.

Q. I mean all the items that you understand and engineers generally include in overhead charges.

A. You will have to be more specific if you want that in percentage. the figure which I am speaking of is $582,699, which I showed you this morning. That is the one you want the percentage of?

Q. Is that what you call overhead charges?

A. No, that is what you call overhead charges.

Q. It is properly called overhead charges. I am trying to get what you have added to the value of this property that is not covered by the physical end itself in the way of overhead charges if that is a right term to use.

A. Well you can't use that in the way you now asked for it
1247 because the going value is an attribute of the physical equipment I can give it to you exactly as I have it here. I think that is what you want.

Q. How do you mean?

A. Total engineering casualty liability, omissions and contingencies plus total taxes during construction plus loss of interest during construction.

Q. All right give me the per cent that bears to the total co-t.

A. It is a trifle over 16 per cent.

Q. What was the sum of these amounts you used for the devisor?

A. The sum of $582,699 which is the total covering the money reported for engineering, casualty liability, omissions and contingencies, taxes during construction and loss of interest during construction represents a trifle over 16 per cent of the total present reproduction cost of the property.

Q. That does not include legal expenses and organization.

A. That per cent is based on the total reproduction cost?

Q. You don't include organization and legal expenses in your divisor?

A. No.

Q. Did you make any effort to ascertain how that per cent appears with what the company had actually paid for these things?

A. No, sir.

Q. You don't know they had to pay any of it?

A. No, I do not.

Q. You made no effort to ascertain that?

A. No, sir.

Q. I wish you would do just one little further job of figuring for me and then I believe I will drop figures, if you will tell me taking all of your overhead charges with your organization and legal expenses and going value and paving and tell me what per cent that is of the total cost as you have it in your re-

1248 port?

A. Based on reproduction?

Q. Yes.

A. Put in real estate?

Q. Real estate as overhead?

A. I have simply taxes during construction.

Q. That is all right, I want that in.

A. You want to include the go-ng value too with this?

Q. Yes, the total making allowance for going value.

A. Making allowance for going value $583,000 plus the total shown in my report for engineering casualty liability, omissions and contingencies, taxes during construction, loss of interest during construction amount to $582,699, the figure corresponding to net construction cost for working capital $142,000 the figure sorresponding to net construction cost of organization and legal expenses $62,000 added together make $1,369,699.

Q. Did you add working capital there?

A. I added working capital exclusive of taxes during construction and interest during construction.

Q. I want you to leave that out and I want to put in the paving.

A. The total of the equivalent of net construction cost for organization and legal expenses which is $62,000 added to the total included in engineering, casualty liability, omissions and contingencies, taxes during construction and loss of interest during construction, which is $582,699 added to the going value allowance of $583,000 added to the total net construction cost of paving specified amount of $330,558 gives a total of $1,558,257 which latter amount represents a little bit over 42.7 per cent of the total reproduction cost of the property.

Q. Wouldn't that be 43 and a fraction rather than 42?

1249 A. Not unless I am wrong here and I don't believe I am.

Q. I guess you have it right. Now you knew did you not that the contract that the gas company had or rather the arrangement that it had here with the city in the way of a charge or rate for gas expired on the first of last January did you?

A. I no doubt had that information, I have forgotten the date.

Q. You had known anyhow whether just then or when you got

it? Now have you made any allowance of any kind anywhere for any deduction from your values in this property because of the fact that the arrangement with the city expired on the first of the year and the gas company now was operating without any arrangement or agreement or franchise.

A. No, sir.

Q. You have made no deduction on that account? Would that make any difference with the value of the property?

A. If the company had to pay for its franchise then of course the franchise payment would be included as part of the capital account of the company. But I made no allowance for franchise value one way or the other.

Q. What I am getting at is this, would it be worth anything in your judgment and would it have any valuation in your theory of arriving at values, if this gas company, this complainant company in addition to having a property that has been enumerated and furnished to you for the basis of your valuation, if it had had a twenty year franchise to carry on its business?

A. No, sir.

Q. That would not add anything in your judgment to the value of this property?

A. It would not add to this particular property anything in my judgment.

1250 Q. Would the fact that there is no other gas company operating here in this town, does that cut any figure in your theory or in your valuation either way?

A. No, sir.

Q. So that the fact, if I understand you, the fact now that the city of Des Moines could grant if it wished tomorrow, a franchise to some other company to come in here and put in a gas plant would not effect in any way the value of this Des Moines Gas Company's property?

A. No, sir. Not so far as this calculation is concerned.

Q. Neither its tangible or intangible property?

A. No, sir.

Q. You have in your list relief holder No. 18 and holder No. 19, the relief holder No. 18 appears on page 84 of your report and storage holder No. 19 on page 85. Now what have you estimated to be the present value of tho-e two holders?

A. No. 18 and 19?

Q. Yes.

A. Total reproduction cost holder No. 18 $36,248. Holder No. 19, total reproduction cost $55,454.

Q. $91,682 that makes is that right?

A. $91,702.

Q. Now Mr. Lea, if it should turn out that these holders only cost this company new, $73,414, would that make any difference in your computation?

A. No, sir.

Q. These particular two holders as they stand down here have no fixed market value in the country anywhere?

A. They are not readily saleable, but they could probably be sold.

Q. That is not quite an answer to my question.

1251 A. Holders of that type certainly are in the market, regularly.

Q. And they have a fixed market value do they?

A. No.

Q. I mean as they stand down here?

A. No. None of these things have fixed values, they fluctuate.

Q. If it should turn out that this company themselves some ten or twelve years ago, longer ago than that, put a value upon these two holders of $73,000, would that fact make any difference?

A. Not the slightest.

Q. You really didn't need any help to get at these values except just to have the list of the property?

A. Practically all except local prices as to labor and material, building construction.

Q. Local prices didn't seem to cut any figure with you?

A. It did.

Q. Prices this company paid didn't?

A. I didn't take the company's word on things like that.

Q. You didn't even ask them?

A. No.

Q. You didn't think they would give it to you correctly.

Q. I thought they would try to, but I didn't suppose the records were in such shape they could give it correct.

Q. For expenditures made within two years?

A. Covering all of the items, it is not customary to keep books that way.

Q. Let me ask you another question, along that line. If you had known or upon inquiry from the company had ascertained that in 1895 Mr. Edward G. Cowdrey, Harry D. Walbridge, Charles R. Fabin, George Irwin Butterworth, Loren E. Chollen, George H. Harper, William Henry White, W. A. Steadman, Waton Clarke, and E. G. Pratt had all under oath valued this gas property at

1252 that time from $440,000 to $483,756.06 would that have made any difference to you?

A. No, sir.

Q. Would not have cut any figure at all?

A. Not at all.

Q. Would not have even given you the slightest basis for arriving at values under your method and theory.

A. Not any basis as valuable as I consider I have in my own records.

Q. You know most of these men I have named?

A. Know every one of them except Mr. Steadman.

Q. Mr. E. G. Pratt was at that time the manager of the company?

A. I believe so.

Q. Mr. Wilton Clarke is now some office- in the company isn't he?

A. He is an officer in the United Gas Improvement Company, I am not sure whether he is in the Des Moines Gas Company or not.

Q. Any way he is an officer in the United Gas Improvement Company.

A. Yes, sir.

Q. Is all the piping that is down here in the yards used in the manufacture of water gas?

A. The pipe itself is not technically used in the manufacture of gas used in the distribution of it or carrying of it around the plant.

Q. Is all that is down there used for that purpose?

A. Maybe some dead pipe down there somewhere, but I understand all pipe in the inventory is live pipe in use.

Q. Do you know that?

A. I have reason to believe it is used.

Q. Are you stating what somebody told you?

1253 Q. I didn't dig up the whole connections to see if they were all under pressure at this time, but did go into the figures to see if the total amount of works piped was a reasonable amount of pipe for a plant of that size.

Q. Did you see any evidence or indications of an old coal gas apparatus down there?

A. Yes, sir.

Q. Is any of this pipe connected up with that?

A. I don't believe there is any connection at all between the old coal gas benches and the present equipment. There is a hydraulic main on top of the benches and I think I can say very clearly that the iron work stops before the end of the brick work is reached and no pipe going through that I can remember.

Q. Did you go about the plant to make an examination of the connections yourself?

A. I didn't try to follow through each of the connections shown in the plans, except on the plans there I did.

Q. Did you of the pipes that are shown on the inventory?

A. The total amount of pipes shown on the inventory appears to me a reasonable amount of pipe?

Q. That is not what I asked you?

A. I have not dug up the pipe and measured.

Q. Would you have to dig up the pipe to find the connection?

A. You would have to dig up mo-e or less of it. It might leave a building in one place and you might think it entered in another but you would have to dig it up to make sure.

Q. All I want is to make sure whether you found any part of the pipe connected up with the old coal gas apparatus? You would not have to dig the pipe up to see if it was connected with

1254 the hydraulic main?

A. You could see it from the hydraulic main down to the ground, a matter of about fifteen feet. I presume that would be maybe ten inch pipe.

Q. You examined that far so you are able to say no part of this pipe is included in the inventory?

A. I don't believe there is pipe there, I may be mistaken about that I don't believe there is a pipe up there, but if there is it is about fifteen feet.

Q. What you want to say by that is there would not be to exceed fifteen feet of pipe.

A. Of pipe. I don't mean by pipe, the hydraulic main.

Q. You mean by that to say there is not to exceed fifteen feet of pipe attached to this old coal gas apparatus?

A. I mean to say I don't believe there is any dead pipe included in the inventory figures.

Q. I suppose you don't know definitely about that?

A. I do not.

Here the further hearing was adjourned until 9:30 a. m. tomorrow.

1255 Saturday Forenoon Session.

JULY 29, 1911, at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of complainant resumed as follows:

HENRY I. LEA, re-called for further cross examination, examined by Mr. Byers, testified as follows:

The MASTER: Will you give me the total reproduction cost of works equipment?

A. $510,179.

The MASTER: Now will you give me the net reconstruction cost?

A. It is in Exhibit E, $420,428.

The MASTER: Now add fifteen per cent to it?

A. To the $420,428?

The MASTER: Yes.

A. $483,492.

The MASTER: Now then what did you add to that for taxes?

Mr. BYERS: In per cent do you mean, Mr. Master?

The MASTER: Yes.

A. 1.496 per cent I add to that is taxes; the total $7,234 works equipment.

The MASTER: Whereabouts will I find the total?

A. The total of taxes?

The MASTER: Yes.

A. Works equipment begins on page 105 on the following page. There is the total net construction, plus engineering added for that year. Here is the corresponding figure for the next year. $2,229 added for the tax of 1912; $4,305 added for 1913; making
1256 a total of $7,234 added for taxes during construction for the works equipment.

The MASTER: What do you make it?

A. $7,234.

The MASTER: Now, then add it together.

A. $7,234 to the net construction plus engineering—that makes $490,726.

The MASTER: Now, then, what do you add to that for interest?

A. Add to that the sum of $19,445.

The MASTER: Now, then, what do you get?

A. You get $510,179. There is a difference of $86 which is accounted for by the decimal point carried out. In my book I show $510,179.

The MASTER: Give me the total tax.

A. Total tax works equipment $7,234; total loss of interest $19,445.

The MASTER: I want you to do the same thing with the distribution system. I understood you yesterday—the reason I ask the question—that 2¼ per cent you add for taxes.

A. It is added but not added throughout the entire period. you want everything in the distribution system complete?

The MASTER: Yes, sir.

A. Turning to Exhibit E—total net construction cost, distribution cost $1,549,871. I have got added fifteen per cent to that first, $232,481. The total for taxes during construction is $48,950 and the total for loss of interest during construction is $131,725.

The MASTER: Can you give me the taxes?

A. Yes, do you want the percentage based on the net construction cost?

The MASTER: No, just as you made it, on the net construction cost with the fifteen per cent added.

1257 A. I will give you the percentage on that total. To the total net construction cost of distribution system complete, plus fifteen per cent, engineering, etc., I have added for taxes during construction 2.757 per cent. or a total of $48,950; a trifle over ¾ per cent.

The MASTER: How much did you add for interest in per cent.

A. To the net construction cost of the distribution system, plus fifteen per cent for engineering, plus tax of $48,950, I have added for loss of interest during construction 7.192 per cent or a total of $131,725.

The MASTER: Now if you multiply that by the average, what you call the composite average, what will it be?

A. If you multiply the total net construction cost of the distribution system, plus $232,481 engineering, etc., that is fifteen per cent, plus $48,950 for taxes during construction, plus $131,725 for loss of interest during construction, you will have that amount multiplied by the per cent condition shown in *in* the table, 88.23 for the distribution as a whole, which will give you the present value—that wouldn't work out in exact dollars.

The MASTER: What is that?

A. To make this work out in even dollars you would have each of the subdivisions, taking it the way it is indocated, taking the reproduction cost by the composite per cent shown gives for the present value $1,731,976.

The MASTER: Just about a thousand dollars difference?

A. Yes, that is due to the discrepancy I have referred to.

The MASTER: The same is true also of the works equipment?
A. Yes, sir.
The MASTER: And also of the buildings?
1258 A. Yes, sir.
The MASTER: I verified the buildings—I think you figured interest at 6.1 instead of 6.179?
A. I used the figure six per cent; I may have made an error that I don't know about.
Mr. BYERS: Mr. Lea, have you any of the data now, the figures I have asked you about in the last day or two and asked you to furnish?
A. No more than I have already furnished.
Q. Nothing except what you had here yesterday?
A. No.
Q. How soon can you get those figures for us and furnish the memoranda we have asked for?
A. I can't make any promise as to time; I don't know just how much time it will require.
Q. Some time next week?
A. Possibly.
Q. I wish, Mr. Lea, you would furnish them to *us* as early as you can. If you do not get it all at once, furnish what you do have as you make it up. Do you have a copy of your Taylorville report in your office?
A. Yes, sir.
Q. I wish you would let us have that too?
A. I cannot do that.
Q. Have you sent for a copy of your report made to Beatrice?
A. For you?
Q. Yes.
A. No.
Q. Will you get a copy of it?
1259 A. I will get it for myself and will produce it if the Master says so.

Mr. BYERS: We would like to have that for the purpose of further testing Mr. Lea's theory that he advances here in this court on values. It is important that we should have either his copy or use the one we have.
The MASTER: If you can, produce it; they want to see whether you proceed on the same theory.
Mr. BYERS: And then we want to compare his values generally along the line here.
The WITNESS: The only objection I have, I have no authority to produce these reports without the consent of the owner. I should be advised by the city of Beatrice if I am authorized to produce that report.
Mr. BYERS: I have here a letter from the Solicitor of Beatrice Nebraska, furnishing a copy of Mr. Lea's report with his statement of the manner in which it was made and Mr. Lea's employment.
The WITNESS: That does not satisfy me.
The WITNESS: I guess Beatrice won't object to furnishing it.

The WITNESS: I don't suppose they will.

The MASTER: Of course, if that is produced it is only fair if there is any difference that the witness have an opportunity to explain it.

Mr. GUERNSEY: I wish now, if your honor please, to suggest that the experts for the city send for all the reports, copies of the reports which they have made, so that when we come to their cross examination won't be delayed.

Mr. BYERS: We will promise you anything you want will be immediately forthcoming, if we have it; and there will be no objections either.

1260 Mr. GUERNSEY: I simply want to save time.

Q. Mr. Lea, I have on my notes here at the very beginning of your examination you stated that you proceeded to put a valuation upon this property, on the theory, or with the thought in your mind of fixing the value at which the property would be purchased by a contemplating buyer; that is right, isn't it?

A. That is right.

Q. And your whole theory and your entire report proceeds upon the theory you are working out the selling price or value of the property?

A. It does not. My report is based on the understanding that I am to determine as nearly as I can the fair present value of the property.

Q. As it could be sold or bought in Des Moines?

A. A value which would be considered fair by the buyer and seller.

Q. Now, Mr. Lea, if you proceed on that theory, what are the important elements—without going into details—what are the important elements of value attached to this property and which you considered in arriving at what would be a fair price for it to a purchaser in a general way?

A. The location, general characteristics of the city, prospective growth of the city, the present magnitude of the physical equipment, its present condition, present value of the business, the possibility of increase.

Q. Anything else?

A. There were a great number of other things.

Q. The more prominent ones are what?

A. Those are the more prominent ones.

Q. Did you take into consideration the original cost of construction?

A. No, sir.

1261 Q. Did you find out what that was?

A. No, sir.

Q. Did you take into consideration the amount expended in permanent improvements?

A. No, sir.

Q. Did you find out what that amount was?

A. I did not.

Q. Did you take into account the market value of the stock of of the Company?

A. No, sir.
Q. Did you try to ascertain that?
A. I know in a general way about what it was; it didn't interest me, I didn't use it.
Q. Did you consider the probability of the earning capacity of the property under the present ordinance?
A. No, I didn't consider the earning capacity in arriving at the value under the ordinance.
Q. Did you consider the amount of the operating expenses?
A. I did later on but not to arrive at a valuation.
Q. I mean leaving out valuations?
A. No, sir.
Q. The cost of the plant of the present company?
A. No, sir.
Q. You made no inquiry about it?
A. No, sir.
Q. And it is not involved in any way in your valuation?
A. It has nothing to do with the reproduction value of the property.
Q. The dividend earned in the past and paid to the stockholders, did you consider that?
A. No, sir.
Q. Did you make an effort to find out what amount had
1262 been earned and paid in the way of dividends to stockholders?
A. No, sir.
Q. Did you consider any surplus earnings of the company, if there were any that had been carried into the capital account?
A. No, sir.
Q. Did you make any inquiry to find out what they were?
A. No, sir.
Q. Now, in this going value would that be worth anything to a purchaser of this plant if he was not permitted to operate it in Des Moines?
A. You are asking whether the going value of a Gas Company in the City of Des Moines would be of value to a man and he couldn't operate it or get into touch with it in any way; I didn't consider that in any way.
Q. Will you answer it?
A. How can I answer a question like that?
Q. Would the Gas Company's present plant be worth any considerable sum to a contemplating purchaser if he were not permitted to operate it in the city?
A. The value would be there whether the particular individual could get to that value or not; the value is there.
Q. The plant would be worth just as much on your theory and in your judgment to a man who would not be permitted to operate it as it would be to a man who was allowed to operate it?
A. That is not what I said.
Q. Is that what you mean?
A. Certainly not.
Q. What would be the difference in the value?

A. I might want to own and operate this plant myself.
Q. Just answer the question.
A. That sort of a question you cant answer yes or no.
1263 Q. You understand, don't you, that before a gas company can use the streets and alleys of cities in Iowa and operate a gas plant they must have a franchise from the city, you understand that?
A. I understand they must have in order to begin operations.
Q. Don't you understand they must have in order to operate at all?
A. No, sir.
Q. That doesn't make any difference?
A. No, sir.
Q. You don't consider in this case here where the complainant owns a plant but without a franchise to operate it makes any difference with the value?
A. Not the slightest.
Q. Suppose you were making out a report, you are an engineer with a reputation and a member of an honorable profession, suppose you were making out a report to a bond company or a company that was about to invest its money in the securities of the Des Moines Gas Company, would you pay any attention to the fact that its franchise to operate in the city of Des Moines had expired?
A. That would depend altogether on the conditions I stated in connection with the property; I am valuing it as it is.
Q. Please answer the question. I want you to assume just what is in that question for the purpose of answering it. If you knew that the franchise under which the Des Moines Gas Company had been operating its business had expired and you were called upon by a company that was about to invest its money in the securities of the company, would the fact now that you knew that the franchise had expired be considered by you and reported to the bond company as affecting the value of eithe- plant or its securities?
A. I can repeat that last answer; that is all I can do.
1264 Mr. Byers: I submit I am entitled to an answer.
The Master: If you can make a better answer do so.
A. I have answered it absolutely—that would depend on the conditions surrounding the plant.
The Master: Would you give it any consideration?
A. Certainly if the franchise had expired at this time it does not in my opinion affect the value of the Des Moines Gas Company in the slightest degree.
Q. Take the Des Moines Gas plant just as it is, with the conditions with respect to the plant here just as it is and assume that on the first of January its franchise for operating in the city of Des Moines had expired, now in your judgment would a purchaser consider the want of a franchise and consider the value of the property less without a franchise?
A. Are you assuming the other conditions to be as they were in the city at that time?

Q. All other conditions that affect the plant?

A. Then the failure of the company to produce a franchise which at that time was alive would not have the slightest value.

Q. It wouldn't cut any figure?

A. No, sir; not in this case.

Q. And you have not given it any consideration in your report?

A. I certainly have.

Q. As affecting the value.

A. I have made the necessary inquiries to determine what effect it might have.

Q. Have you made any reduction because of the want of a franchise?

A. There is no occasion for it in this case.

Q. I say have you made any?

A. I have not

1265 Q. Now, just another question along that line. If the cost of reproducing the company's plant because of extreme depreciation of labor and material was not more than fifty to seventy-five per cent of its original cost to the company, would you still have adopted the reproduction theory in arriving at the value?

A. I would never assume a price peculiar to an abnormal period at any time in the placing of the value on a property out of fairness to all concerned. You have got to arrive as nearly as you can at a fair average figures, not abnormally high nor abnormally low.

Q. Then, as I understand you, if the cost of labor and material here in Des Moines, the kind of labor used by the Gas Company, had been fifty percent under what you found it, you would not have adopted it in the reproduction theory?

A. I wouldn't if this price were an abnormal price.

Q. Then what theory would you adopt?

A. Exactly what I did. I adopted the reproduction theory basis on what I considered fair, average prices over a period of years, neither abnormally high nor abnormally low.

Q. Then the prices of material and labor you have adopted are not present prices of material and labor in Des Moines?

A. They are what I considered the fair average prices that would be met in the period of construction considered here.

Q. So that then your report does not proceed on the theory and is not based upon the actual cost on the first day of January, 1911,

A. The labor and material such as makes up this gas plant in Des Moines, the actual cost of labor on the first of January 1911 is one of the items entering into my judgment as to what would be a fair average rate for labor of a given kind throughout the period of construction.

Q. Of how many years?

1266 A. As indicated by the chart.

Q. How many years do you say?

A. I think about four.

Q. Then in all that figuring you considered a four year period?

A. Whatever is shown by the chart.

Q. Will you call it four years for the purpose of illustration.

After you consider a period of three or four years whatever your report shows, to get at what would be, as you say, a reasonable and fair cost of labor and material, did you find that to be higher or lower than it was on the first day of January, 1910?

A. I don't remember.

Q. Is there any way anobody can tell from your report?

A. Not from my report.

Q. Did you try to ascertain the value of this property by capitalizing its earnings?

A. No, sir.

Q. Now, I haven't put that question before, have I.

A. No, it has not been asked before.

Q. Do you know and can you tell the Master now upon what amount the net earnings of the Des Moines Gas Company plant would pay six per cent?

A. No, sir.

Q. Why can't you?

A. Because I don't know the amount.

Q. Don't you know the amount of their earnings for the last year, net earnings?

A. No, sir.

Q. Don't you know the amount of their net earnings for 1909?

A. I don't carry any such figures in my mind.

Q. Do you have them anywhere?

A. I presume I have some of them.

1267 Q. You have the net earnings here with you for 1910?

A. No.

Q. Can they be found by an examination of your report?

A. No.

Q. No way that they can be figured out from your report?

A. Not from my report.

Q. Is there any way the gross earnings can be figured out from your report of the Company's business for 1910?

A. No, sir.

Q. For 1909?

A. No, sir.

Q. For 1908?

A. No year.

Q. What does this diagram with respect to gross revenues, operating expenses, what did you figure out from that; did you figure out the gross revenue of the company?

A. You can approximate it from the curves but you can't get the exact amounts because accurate readings is impossible on so small a scale.

Q. The scale is so small that it is impossible to get to a cent or dollar

A. You may look at it and see.

Q. You just give it to us approximately?

A. I can't tell approximately.

Q. You can't tell approximately, not from your sheet?

A. I wouldn't give you figures of that kind without giving them to you exactly.

Q. How many persons, Mr. Lea, had a part in the making up of this report Exhibit 20?

A. Well, I don't know how many men the Gas Company
1268 had to prepare the material they gave to me.

Q. Give me the number of people you know about?

A. There were four in my office; that is all I am positive about.

Q. How many of them were engineers?

A. Two besides myself.

Q. How many persons outside of your own office do you know had a hand in it?

A. I know a group of men were all more or less connected with it; I don't know what part each one did.

Q. I am asking for the number of persons?

A. I don't know how many.

Q. Well, how many do you now have in mind, of course there were more than you can remember.

A. There were eighteen on the inventory I have learned of; some of them I know; there were about I think seven or eight more I knew of directly connected with the preparation of the inventory.

Q. The eighteen persons you speak of had a hand in making the inventory but didn't do any work that appears in Exhibit 20?

A. They made the inventory from which my figures are taken.

Q. I am talking now of who actually had something to do with the making of this Exhibit 20 as it appears.

Q. Specify what you mean by something to do.

Q. Well, prepared any part of it or page in it?

A. Be more particular; what do you mean—who did the typewriting, who bound the book?

Q. Who did the actual work of making up that sheet?

A. The photographer in Chicago.

Q. Who did the actual work of making the original of which that is a copy?

1269 A. The draftsman in my office.

Q. Who furnished him the material?

A. I did.

Q. Anybody else?

A. Some of the material was furnished to me and the balance I worked out myself.

Q. Who furnished the other material to you?

A. The Gas Company furnished material showing abstracts from the records of the Company up to the end of the year 1910; the balance I worked out.

Q. Now limit the question to the persons who actually did some of the work in here—I don't mean just the typewriting—I mean the persons who either furnished the memoranda for the typewriter, or dictated it to the typewriter, limit it to the number of persons who exactly did some work of preparation—not the preliminary work of Exhibit 20.

A. There were four most of the time and five part of the time in my office.

Q. This work was all finally completed there at the office in Chicago?

A. Certainly.

Q. Did any of the engineers of the Des Moines Gas Company or any other gas company perform any part of the work?

A. No, sir not beyond the preliminary work. Every item I received from the Gas Company was in the nature of preliminary information necessary in arriving at the facts on which I based the valuation, and none of the valuation figures in any sense have been provided by anybody to me.

Q. I am not asking that at all; that is not what I am trying to find out. I am trying to find out from you, Mr. Lea, whether
1270 you yourself worked out all these details and furnished the material to your typewriters, or whether some of those other gentlemen furnished a part?

A. I personally furnished everything except the preparation or quantities of the material.

Q. Nobody had any hand in that?

A. Not in the making of the valuations and figures, no sir.

Q. Now can you give us from your curve sheet—I think you said you couldn't—you can approximate the gross revenue for any year?

A. I could approximate it in the sense you use it. I don't want to give you any figures representing results on so small a scale because you will hold me to it later.

Q. I won't hold you to it. Just take page 96 here and confine your answer now to the curved sheet itself without regard to whether it shows exactly; I want to know if you can tell me, for instance, what your curved sheet shows the gross revenue for 1909 to be, worked out on this sheet?

A. You will find the gross revenue line crossing the 1909 line between $475,000; and $500, that is as close as I can give it.

Q. Between $400,000 and what?

A. Between $475,000 and $500,000.

Q. Now give it for 1910?

A. That is between $500,000 and $550,000.

The MASTER: About $530,000?

A. That is as close as you can read it.

Q. And the operating expenses for the same year are worked out on the sheet?

A. The operating expenses are shown up to 1910 and don't include depreciation; that is something over $350,000.

Q. What is it for 1909?

1271 A. Somewhere between $300,000 and $350,000.

Q. Now, that under this sheet includes taxes but not depreciation?

A. Yes, it includes taxes but not depreciation up to the year 1910.

Q. Now, with the depreciation taken out as you are working it out on this sheet, the difference between the amounts you gibe me there as to the revenues and operating expenses would be the profits of the business?

A. Certainly not.

Q. Well, plus depreciation?

A. Certainly not.

Q. Well, what else would there be in there?

A. I understand there are some bonds outstanding; I don't know what amount; bond interest is obviously net profit.

Q. There may be something else involved here; there is nothing here to show anything about bonds that are out?

A. No.

Q. Then let us put it in another way; that is, the difference then, would show the profits the bonded interest plus depreciation?

A. You have got to put it different.

Q. You put it in your own way.

The MASTER: The depreciation is what he wants to know about.

Q. What I want to get at Mr. Witness, is what the difference between those two lines would represent in your judgment?

A. The differences between the gross revenue and operating expenses, you mean?

Q. As you have it worked out here up to 1910.

A. Why the difference between the gross revenue and operating expenses as shown here would indicate only that an incomplete statement has been made.

1272 Q. All right, we will let it stand at that. The gross revenue in your scheme on record here was a fundamental factor in your calculation of the going value?

A. It was one of the factors, no more fundamental than a great many others.

Q. It was a factor?

A. It was a factor.

Q. Now if the difference between these two lines had been much less than appears there would that have any effect on your going value?

A. Certainly.

Q. In what way?

A. Other things being as they are a narrowing of the difference between the gross revenue and the total operating expense would tend to reduce the amount of going value.

Q. So that the difference worked out on your curved sheet here, say the difference between your curved sheet and the actual situation of the gas plant would be $50,000. How much less would that make your going value?

A. Make your question explicit; I can't answer it the way you asked it.

Q. Well you show a margin on this curved sheet you just worked out between two lines, one marked gross revenue and the other marked operating expenses, including taxes, but not depreciation?

A. Yes, sir.

Q. You worked out an amount there in figures, haven't you, for me of about $175,000 difference in the figures, as you stated?

A. I didn't state $175,000.

Q. But the difference was about that between the figures you did give me?

1273 A. I don't know what the difference is.

Mr. GUERNSEY: For which year?

Mr. BYERS: Take 1910, Mr. Lea, and tell the Master what the difference would be worked out on this curved sheet between the gross revenue actual, and the operating expenses actual, including taxes, but not depreciation.

A. As near as I can read the chart the difference between the gross revenue for 1910 and the operating expenses including taxes but not depreciation is $175,000.

Q. Now, then, suppose instead of showing that amount the curved sheet had shown $50,000 less, now what per cent of reduction would that have made on your so-called going value?

A. It would have made a small reduction in the percentage; I can't say how much.

Q. About approximately, how much?

A. I can't say.

Q. Give us your best judgment?

A. I haven't any judgment.

Q. No judgment about it—all right, we will let it stand at that. Now, to give you an opportunity to express a judgment, if you have any, suppose it was a hundred thousand dollars less, what per cent of reduction would that work out on your so-called going value scheme that you worked out?

A. I can't say without calculating.

Q. Can't you approximately?

A. No, sir.

Q. Can't you give us some idea?

A. No, sir.

Q. Would it be large or small?

A. I can't say whether it would without figuring.

1274 Q. Would it be half?

A. I can't say without figuring.

Q. Would it reduce it seventy-five per cent?

A. I can't say without figuring it.

Q. All right. If the assumed gross revenue for the next seven years were ten per cent or ten cents per thousand feet less than you assume, how would that affect your going value?

A. I can't say without figuring that either because there are a lot of other things involved.

Q. Would it affect it at all?

A. It might affect it either way; it might run it up or down.

Q. Will you figure that up for us in connection with showing the prospective growth from 1910 to 1918?

A. I will if I have time.

Q. We will ask you to do that before we close the cross examination. Well, isn't it true that the higher the price charged for gas the more the going value of your plant?

A. As a general proposition it is not so.

Q. Is it so here?

A. It is not.

Q. What would be approximately the effect on your going value

if the prices were raised to $1.10—I mean now worked out here on your Exhibit 20?

A. It might increase the going value and it might decrease it.

Q. You don't know?

A. No, sir; and nobody else does.

Q. There is no way you could figure it out from your report?

A. No, not from this report. It can't be figured.

Q. But there is no way you can figure it out from your report?

A. No.

1275 Q. Is the same thing true as to ninety cents?

A. Certainly.

Q. If the plant owned by the Gas Company including all of its services and meters could be instantly duplicated on January 1, 1911, and if everything then owned by the gas consumers in the way of gas appliances in Des Moines remained in place as they were at that time, on the first of January, in the present city, and its existing practical acquaintance, that is, the city's acquaintance and people's acquaintance with the use of gas in the city, there would be no going value, would there?

A. As compared with what?

Q. If the Des Moines Gas plant could be duplicated instantly on the first day of January, 1911, and all other conditions with respect to gas consumers was just the same on the first day of January, 1911, as it was when you looked over the field, the connections and appliances and education, all that was just the same, there wouldn't be any going value, would there?

A. Are you asserting that you are going to put in a second plant complete in all particulars, an exact duplicate of the existing plant in the existing town, put it into service immediately, and the existing plant dissolves or disappears?

Q. (Last question repeated.)

A. You are assuming this business is not connected up?

A. No, I am assuming just what I say there, the whole thing is just as it was when we found it on the first day of January, 1911, connected up and the plant could be reproduced instantly, would there be any going value?

A. You are in a realm of speculation. I am not prepared and I won't say. I am only considering those things which are humanely possible.

1276 Q. Is your hypothetical town humanly possible as you worked it out?

A. I am not reproducing a hypothetical town. The thing I am reproducing in my hypothetical calculation here is certainly humanly possible.

Q. Do you want further time to figure this out?

A. I don't want to figure it at all. I can't figure on anything not humanly possible.

Q. That is all the answer you want to make?

A. Yes, sir.

Q. Is it humanly possible, Mr. Witness, for every house, take twenty thousand houses of a town, to be all piped for gas and no connections?

A. Certainly.
Q. And no fixtures?
A. Certainly.
Q. That is the theory you figured on, it is humanly possible?
A. Of course.
Q. When you were making your valuation for the Peoples Gas Light Company in Chicago for hostile interests that you referred to, did you have full access to the manufacturing plants of the company?
A. Yes, sir.
Q. What work of valuation did you have or do at Buffalo?
A. None on valuation.
Q. What did you do?
A. I made a lot of calculations in connection with their engineer to determine economies that could be effected in the cost of *of* manufacturing and distributing gas in the city of Buffalo and the work was done by the city of Buffalo.
1277 Q. Not any valuation at all?
A. No, except as the equiment would be effected by the changes that would be involved.
Q. Who paid you for your work?
A. The city of Buffalo.
Q. Do you remember the amount?
A. No, and if I did, I wouldn't tell you.
Q. Did you estimate the going value at all?
A. Why, no; I didn't appraise the property of the company.
Q. You didn't furnish any report at all that in any manner worked out values there, going value or any other kind?
A. No, sir; I had nothing whatever to do with the valuation of the property as a whole.
Q. At Taylorville, did you value the property as a whole?
A. Yes.
Q. I have forgotten when you told me you did that.
A. I have forgotten too.
Q. About when was it?
A. I don't know, sometime this year.
Q. Was it since February?
A. I don't know.
Q. Since March?
A. I don't know.
Q. Was it before February?
A. I don't know.
Q. When did you furnish the Des Moines Gas Company with Exhibit 20 or a copy of it?
A. I don't know the date.
Q. About when?
A. It was, I should judge, about two months ago.
1278 Q. That would be some time in May or June?
A. Some time in June probably.
Q. Early in June?
A. I think so.

Q. Did you furnish your report at Taylorville before that?
A. I don't remember.
Q. Was it before the first of January last?
A. I don't remember.
Q. You told us yesterday, Mr. Lea, that you used a three per cent sinking fund for a part of the plant in all cases of fifty years life; did you use that per cent?
A. I did.
Q. That is true all the way through wherever the life is fifty years, you use three per cent?
A. If that is the figure I gave you yesterday.
Q. For a part of the plant having, as I remember it, twenty years life, you used three and one-fourth per cent?
A. Whatever I gave you yesterday was correct.
Q. Did you usethat per cent for all parts of the plant of that age?
A. Yes.
Q. Now, what other percentages were used, if any, other than the three per cent?
A. There were several others; there are different percentages for each different length of life.
Q. Well, give us the other if you can without too much trouble.
A. What year do you want?
Q. You have already given fifty and twenty—where is your table?
A. You can't find my table; it is my personal property.
Q. Use your personal property for a few minutes, if you will, and give us the figures.
1279 A. What length of life?
Q. The years that you have used.
A. I have used a good many.
Q. Well, give us all of them.
A. The first life I have is fifty years and that is three per cent; the next is thirty years, three and one-fourth per cent; the next is forty years, and that is three per cent; the next is twenty years and that is three and one-half per cent; the next is sixteen years and that is between three and one-fourth and three and one-half—I would have to look up my records; the next is twenty-five years at three and one-half per cent; the next is fifteen years at three and three-fourth- per cent; the next is ten years at four per cent; next is forty years at three per cent; the next is thirty-five years at three and one-fourth per cent; next is seventy-five years at two and three-fourth- per cent; the next is sixty years at two and three-fourth- per cent. That is all, I think.
Q. Now, Mr. Lea, to ascertain those percentages you had to get some private record you have of your own?
A. Yes.
Q. Why did you use those different percentages, just explain that, please?
A. Because I believe as you increase the life you will decrease the net interest which you will find it possible to realize.
Q. And that is the reason you have made the difference in the rates as to life?

A. Exactly.

Q. Now, this sinking fund as you worked it out here is based on a fair rate of interest upon a safe security, is that the thought?

1280 A. It is based on a fair rate of interest and on creditable security.

Q. Now, if that were true, why did you use as low a rate as three per cent?

A. Because men who know about those things tell me that is the right figure to use.

Q. They told you that was about the right figure?

A. Yes, they explained why.

Q. That is the reason you used it?

A. Certainly no other reason. I haven't any judgment of my own as to financial matters of that kind.

Q. Now I wish you would take any case out of your report there, take any typical case and illustrate for us just how you got at your investment age.

A. You mean the composite age of the investment interest?

Q. You understand it, that could be worked out from your report?

A. I said from some method as shown in my report.

Q. We have had difficulty in trying to get head or tail to it, and I wish you would take any one case that would be an illustration for the Master, or the rest of us, and figure it out for us on an investment basis?

A. Any one case of what?

Q. You don't know what I am trying to get at?

A. No.

Q. For instance, in your report you have meters and you have set out—you give some of it on page 12—average age meters 7.70 years. Just tell us how you figured that out?

A. That is figured by compiling first a record—as I explained yesterday—of the total number of meters in use at the end of a given year and the total number of meters installed during each year back as far as the record will go and multiplying the meters

1281 installed in a given year by the number of years in service, you will find for each of the years the total meter years; add the total of meter years, or rather by adding the meter years for each year you arrive at a total number of meter years, which divided by the total number of meters installed at the time of the making of the calculation will give you the composite age or installation basis.

Q. Just notice the question?

A. I am answering it. To arrive at this same figure on the investment basis instead of using only the number of meters installed during the year you split it up into the meters of each size or use instead the average size of meters and multiply by the unit for that type of meter installed, and you will have instead of the total meter year total meter dollars.

Q. How does that give you total meter dollars?

A. The same as this gives total meter years.

Q. Where do you get your dollars to support that?

A. You get your dollars, knowing what it would cost to install

the meter at a given time which would be the total dollar year I should say.

Q. To get that, to figure out this 7.70 down here, we would have to have some other figures and information than what appears here?

A. You would have to have enough knowledge of the business to apply the correct units.

Q. We would have to know the cost of the units.

A. If you have a knowledge of the business you have those units.

Q. You would have to have that before these figures can be arrived at.

A. These figures are not arrived at by men not familiar with the business.

Q. It is your business now, as I understand it, to help us.

1282 Do you have anywhere these dollar meters years or dollar years as you worked it out to make this 7.70?

A. I may have it.

Q. You did have it at one time?

A. I believe I did; I think I have it now.

Q. Who worked out those figures here?

A. Which figures?

Q. The last line on page 5.

A. That is a copy from the summary of these details coming from the company.

Q. Who made the detauls?

A. Some one in the employ of the gas company.

Q. Was this 7.70 furnished to you as a part of the details?

A. Yes, after I had verified the calculation——

Q. That is the answer now—we are satisfied with it. Suppose now, Mr. Lea, you had only the following facts, taken merely as an illustration of your method; how would you proceed to get an investment age, say five thousand meters on connections which first had meters thirty years ago——

A. How many meters thirty years ago?

Q. Five thousand. Listen to the question. Five thousand meters on connection- which first had meters thirty years ago——

A. I don't get the drift of that.

Q. Five thousand meters which first had meters twenty years ago——

A. I don't know of any meters having meters.

Q. Five thousand meters on connection- which first had meters five years ago?

A. You will have to ask it again; I can't understand that at all.

Q. Is there too many meters or too much time?

A. There is too much ambiguity.

1283 Q. Well, let us reduce it a little—suppose you only had the following facts, taken merely as an illustration now of your method; how would you proceed to get the investment age of five thousand meters on connections which first had meters thirty years ago—five thousand meters on connections which first had meters twenty years ago?

A. I understand that.

Q. Is that the only answer you want to give?
A. That is all.
Q. Take page 12 of your report and take everything opposite the year- 1890 and 1887 and assume now those are the only lines on that page and work out the average age on an investment basis for us?
A. It is a very simple thing to do; it takes a lot of time.
Q. Well, do it—if it takes too long do it some other time and hand it in to us later.

Mr. BYERS: That is as far as I can proceed with this witness until these other matters are figured out and the memorandas and papers asked for are produced. There is another question or two I want to ask.

Q. In making up your report, did you work out specials on the percentage basis?
A. By the percentage basis.
Q. Not by actual count?
A. No, not by actual count.
Q. What per cent did you use to arrive at it?
A. Four and one-half per cent for the pipe.
Q. Four and one-half per cent of what?
A. Of the net cost of the iron pipe itself.
Q. That includes all these so-called seal pots that have been referred to?
1284 A. All crosses, T's, Y's, L's and drip pots. I think there were some few valves that were listed separately. It certainly does not cover valves. It only covers cast iron connection other than iron valves, including drip pots; no, unless the drip pot is on the side line, the line drip itself is not included as a special; all drips are treated separately as drips and not specials.
Q. You exclude from your specials what make up the four and one-half per cent of line drips and pipes leading to it?
A. Wrought iron pipes, yes.
A. And all valves are excluded?
Q. Yes, that is because the number of valves required vary at a wide range in different cities and you can't use any definite figure. You couldn't take any corresponding percentage for drips or valves.
Mr. GUERNSEY: You were asked if you were excluding line drips.
A. I have not included them at four and one-half per cent.
Mr. GUERNSEY: What pipes lead to line drips?
A. No pipes lead to the line drips; we have a wrought iron line running over to the side drips.
Mr. BYERS: Now, Mr. Lea, you said something about wrought iron pipe in your report and your report refers to wrought iron pipe in many places; do you just assume that was wrought iron pipe or is it in fact wrought iron pipe?
A. As a matter of fact we do not buy wrought iron pipe, we buy wrought pipe. We all understand we are not buying real wrought iron; everybody understands that, unless we specify particularly wrought iron; wrought pipe is the trade name for that style of pipe.

Q. Wherever that item appears in your report, does it
1285 mean wrought iron?

A. It means what I said, W. I. is the symbol used and that means wrought pipe. It used to be all wrought iron years ago and finally the dealers found they could make a steel pipe and slip it in on the gas companies, until now, we all understand it is not a wrought iron pipe.

Q. Then, as a matter of fact, wherever that term appears it does not mean wrought iron, but just steel?

A. It means wrought steel.

Q. It is cheaper than wrought iron?

A. Per foot.

Q. And don't last so long?

A. In some places it does; as a rule it does not last as long as wrought iron pipe.

Redirect examination by Mr. GUERNSEY:

Q. You just referred to a per cent of specials; what is your basis for that four and one-half per cent that you took.

—. I have made a number of calculations in different towns where I have done work, laying street mains, and I have seen corresponding figures from other men who have done work of that character, which all go to show that a fair allowance for the extra cost of specials would be four and one-half per cent of the cost of the pipe itself. That does not cover any additional charge on the pipe.

Q. That is what you call net construction?

A. It is often less than that. If the cost of the pipe per foot is thirty cents, I will add four and one-half per cent for specials.

1286 Q. That is the figure that has been developed by practice in your profession?

A. It does not mean four and one-half per cent of the total cost of pipe laying by any means.

Q. Is that pipe with the freight added?

A. That is just the net cost per foot of pipe. If pipe costs you thirty dollars a ton, four and one-half cents a pound, your cost per special would be four and one-half per cent of that.

The MASTER: In Des Moines?

A. If the prices were not different.

The MASTER: Do you include freight?

A. No, just the cost of the pipe without the freight or labor or paving, and work required in paying pipe.

Mr. GUERNSEY: One other thing, before I forget it, you were asked some questions based upon the assumption that the company here has no franchise—which is an assumption which arises in the imagination of counsel,—but I suppose we might as well go into it. Now, just assume, if you will, that the company on the first day of January, 1911, had absolutely no franchise whatever. It had this plant here which it had been operating up to that time, and that it was negotiating with the city for a new franchise and in that connection the question of rates arose and you were asked as an expert

to determine the value of that property in view of those negotiations, would that have any effect on your valuation in the slightest degree?

A. Not in the slightest.

Q. You testified, I believe, a little while ago that all the information contained on page 12 of your report Exhibit 20, which is the page headed average meters, installation basis, was furnished to you by some one connected with the complainant?

1287 A. Yes, sir.

Q. And that includes the computation at the bottom of the page?

A. Yes, sir.

Q. You mean this is practically a copy of what is given to you?

A. Yes, sir.

Q. I wish you would tell the Master what steps you took to verify it before making use of it?

A. I saw some of the detail records from which the basic material was taken and checked over enough of it to satisfy myself and to know it was honestly and accurately made. I did not check every figure. I satisfied myself it was correct, it was made on a correct basis and by men who had the data with which to make it and they were making it honestly.

Q. Another thing: you were asked if while you were making the examination of the property of the Gas Company in Chicago for what you designated as a hostile interest you were allowed access to the plant or plants of that company, and you said yes. Now I wish you would tell the Master whether before you requested that access you disclosed the fact that you were representing hostile interests to that gas company?

A. I certainly did.

Q. Now, with reference to these line drips and apparatus, is that under your distribution system in your inventory?

A. Yes, sir, in Exhibit I.

Q. That is on page 92. Turning to that page, tell us whether the drip pots as well as the valves were inventoried separately and not included in the estimate of percentage on specials.

A. All the drip pots and valves in the distribution system were separately itemized and were not included in any sense in the four and one-half per cent I have added to the weight of cast iron

1288 pipe in arriving at the allowance for specials.

Q. Now, you were asked if from your report the going value on the basis of a ninety cent rate for gas could be ascertained, and whether it could be ascertained on the basis of $1.10 rate, and you said it could not.

A. I said it could not be determined from my report but it could be determined on exactly the same method.

Q. What was the rate of the going plant at?

A. One dollar.

Q. If you had calculated the going value in your report on a ninety cent basis, would it have been accurate?

A. Certainly not.

Q. Or on a $1.10 basis?
A. Not.
Q. You were assumed to make an estimate of the going value in the city of Des Moines?
A. Yes, sir.
Q. Your report did not show what the distribution system of the Kalamazoo plant would cost?
A. No.
Q. It don't show anything except what you attempted to get at as the present value of this plant at that time under the actual conditions?
A. That is all it shows.

Mr. BYERS: Mr. reporter, will you please mark this exhibit of tabulated figures.
(Paper marked Defendants' Exhibit No. 7.)
By agreement of parties the witness is to make a correct duplicate of the same in typewriting.

At this time an adjournment was taken until July 31, 1911, at 9:30 a. m.

1289 Monday Forenoon Session.

JULY 31, 1911—at 9:30 a. m.

Counsel for the respective parties all present.
Testimony on part of Complainant resumed as follows:

HENRY I. LEA, re-called for further direct examination, examined by Mr. Guernsey, testified as follows:

Q. Mr. Lea, what are some of the things incuded in this percentage, on account of engineering, for instance?
A. The study of available sites for a gas plant within the city of Des Moines; the making of accurate maps of such real estate as is finally selected, of determining elevations of the various portions of such real estate; the making of the detailed plans and specifications covering all of the equipment at the works and in the distribution system; the comparing of the bids and specifications submitted by various contractors; the recommendation to the company as to which bid to accept, or the actual placing of contracts by the engineers; the supervision of the various stages of construction up to the final completion and the approval of the final payment on each of the individual contracts.
The MASTER: It is the ordinary work of engineering and the architect?
A. Yes, sir.
The MASTER: Including the supervision and superintendence of the construction?
A. Yes, sir.
Q. You were asked on your cross examination something about

contractor's profit. On what parts of the plant did you figure
1290 contractor's profit?

A. On only such portions as the company would ordinarily do by the contractor method, and that would be restricted to the plant and works equipment, the machinery and buildings in the plant itself; the street work being in nearly every case performed by the company itself.

Q. By the plant you mean manufacturing plant?

A. Yes, sir. Now there might in a case like this, there might be river crossings let to a contractor in occasional instances, but ordinarily that would also be done by the company; but the building of gas holders, putting up buildings for gas making and purifying machinery, meters, etc., of the plant would be done under the contract system by concerns specially adapted to that kind of work.

Q. Do these contractors expect a profit?

A. Their profit is in the price I call net construction cost.

Q. They anticipate and insist at least a prospective profit?

A. Yes, they do.

Q. On your cross examination you were asked several questions questions in connection with the matter of going value as to how your ultimate result would be affected say by a reduction of fifty thousand dollars in the gross revenue, or things like that. I wish you would state to the Master whether you could ascertain what effect that would have without making a computation through all these details?

A. No, sir; you can't.

Q. Two or three or several questions were asked you based upon the hypothesis that the present plant might be instantly duplicated; is this physically possible?

A. It is not.

1291 *Q.* The MASTER: What is the use asking that question.

Mr. GUERNSEY: I don't think there is any more use in it than there was in asking a question on that hypothesis.

The MASTER: That does not differ the question altogether in my judgment; of course, I am not expressing an opinion.

Q. Now, then, you were also asked a number of questions based upon the possibility of relaying the mains when streets happen to be unpaved; are these two hypotheses consistent?

Objected to on part of defendants as being incompetent.

A. No, they are not consistent. While it would be possible to relay some mains at the proper time coincident with the opening of the existing paving for replacing, it would just as naturally follow that a large part of the mains now without paving would at that time be covered with comparatively new paving and that a large part of the paving now existing would have been replaced and would be in such condition that it would not warrant the city in tearing it up for this purpose.

Q. If the plant were instantly replaced, would it be possible to wait for the streets to be torn up for repaving?

A. No, certainly it is safe to say if you were to wait until the city opened streets for repaving that cost would be very much in excess of what I have allowed in my estimate.

Q. On your cross examination you referred to a year's gross income as having been taken as a sort of an arbitrary measure of going value in the gas business?

A. Yes.

Q. Now what is the fact about that—this is, has that been accepted as a sort of an arbitrary test?

A. It has been accepted by a number of experienced men as an approximation of the going value.

1292 Q. And what about the thirty dollars per meter?

A. That is another method which has been used frequently.

Q. In the same way?

A. In the same way and for the same purpose.

Q. I think that referring to the third plat or chart which is in your report, Exhibit 20, you tell us that the gross revenue as shown there on page 96 was something over $525,000 for the year 1910?

A. Yes.

Q. So that would have run something under your computation of going value in your report if that rule had been adopted?

A. If I had adopted one year going value, I would have a value lower than shown.

Q. Now, suppose you had adopted thirty dollars per meter?

A. I would have a going value somewhat higher than I have shown.

Q. During a part of your cross examination General Byers used the expression gas appliances, referring to piping, and you used it in another sense; in what sense did you use it?

A. I used the term gas appliance to cover only such devices as actually consume gas, like lighting fixtures, mantels and lamps on the fixtures, water heaters, gas ranges, flat iron heaters or flat irons containing gas burners fed by a rubber tube leading to them, appliances actually consuming gas, not piping leading to them.

Q. You said several times on your cross examination that your method of computing going value would not work unless certain factors were ascertained; what do you mean by work?

A. Wouldn't show correct results.

The MASTER: In other words, you have got to have a correct basis?

1293 A. Yes, sir; you have got to assume conditions humanly possible and in proper sequence; such sequences as you actually find in practice in order to arrive at an accurate and dependable result.

Q. In this same connection I think in answer to some question on cross examination you assented to the use of the word speculative as describing the projections upon these charts as to conditions after the end of 1910. In what sense do you use this word speculative or assent *of* its use?

A. As applying to figures made or estimates made which are projected into the future, something which you can say is in the future because it has not yet come into being; you assume such and such results will be reached, and to my mind that is speculative.

Q. Something that is a matter of judgment as distinguished from something that has happened?

A. Yes, sir; something that applies to the future.

Q. Why is it that the gas appliances to which you refer are sold by the companies and are not sold generally like other merchandise?

A. Because the purpose of the company is primarily to increase its sales, and to that end it must get as many appliances in use as possible, from which it follows that they must be sold as low as possible. The gas company therefore has no motive except to sell at cost, and the selling of such appliances at cost is the uniform practice throughout the entire country.

Q. You referred to the 6 foot 6 sets as something you would not put into a new plant if you were building one. What is the fact as to whether the condition that exists here, taking this as an illustration of it is the condition found in every gas plant that has
1294 been developed in a growing city.

Objected to on part of defendants as being immaterial.

A. I believe my statement was that I would not if I were today building the plant of the present total capacity of the Des Moines Gas plant install 6 foot 6 units; but it certainly is a fact that this plant has gone through the period when this was the proper size to install. It was more economical in the conduct of the business to install the 6 foot 6 units, later the 8 foot 6 units and then still later install the 10 foot 6 units as the plant grew in capacity——

Q. That is not just the question I am asking. I asked you whether this is a condition that you find in the gas plants that have developed in a growing community.

A. It certainly is.

Q. Now, then, when the 8 foot 6 sets were put in, of course additional 8 foot 6 sets could have been installed for the reserve capacity instead of 6 foot 6; and when the 10 foot 6 sets were put in of course additional 10 foot 6 sets could have been put in instead of using the 6 foot 6 and the 8 foot 6 sets that the company had?

A. Yes, sir.

Q. If that had been done, how would it have effected the situation from the standpoint of economy?

A. There would have been unnecessary investments with a corresponding unnecessary interest charge.

Q. How about the depreciation?

A. The maintenance charges and depreciation charges would have been unnecessarily increased.

Q. So that *what* is the reason that has induced not only this plant but gas plants generally to adopt the course that has been followed here.

1295 A. The reason is that each company is planning on making its gas at the lowest cost per thousand feet.

Q. It is a question of economy?

A. Yes.

Q. You said in your cross examination that so far as the matter had come under your observation the books of the companies did not show correctly the cost of construction—I do not refer to this company but I refer to gas companies in general—and I think you gave that as one reason why you did not go to the books of this company for these costs. I wish you would explain that statement, state why that is true in your judgment.

A. Well, the company ordinarily keeps its accounts in such a way that they show the total amount of money expended for construction throughout the year and they can in most cases show from that total amount the proportion that has been charged to a given piece of construction, but they do not keep those accounts so that all the elements entering into a specific piece of equipment show that piece of equipment throughout the books; you would have to go through the books and segregate a lot of items. We know from experience about what proportion that will work out and these are the proportions I have used rather than dig them out of the company's books.

Redirect examination closed.

Mr. BYERS: We will not take up further cross examination until the information the witness is to produce is at hand.

Excused.

1296 WILLIAM A. BAEHR, being first duly sworn, on part of complainant, examined in chief by N. T. Guernsey, Esq., testified as follows:

Q. Please give the reporter your name, age, place of residence and occupation?

A. My name is William A. Baehr; age, thirty-seven; residence is Chicago; my occupation *os* consulting engineer.

Q. You say you are a consulting engineer. Have you specialized as to any particular matter in your consulting engineering, and if so, what?

A. My principal work is in gas engineering.

Q. Now, I wish you would state what experience you have had, stating it in detail, in connection with the construction, manufacture and operation of gas plants, and what special technical study you have taken for the purpose of preparing yourself for this professional work?

A. If there are no objections I might read what I have formulated on paper here regarding my experience; if there are no objections——

Mr. BYERS: That will be all right; we have no objection to that at all.

A. Witness reads memoranda as follows: In 1894 I graduated from the civil Engineering course at the University of Wisconsin at Madison, Wisconsin. During my college course, I did some work surveying for the City Engineer of Oshkosh, Wisconsin, during one

summer vacation. After graduation I was employed in the Bridge and Building Department of the Wisconsin Central Railway, now the Soo Line, doing office work. Subsequently, I did some real estate surveying in the suburbs of Chicago in charge of the
1297 field work. In the spring of 1895 I became a draftsman at the Edgemoor Bridge Works near Wilmington, Delaware. In the fall of 1895 I went to the Wisconsin Bridge and Iron Company at Milwaukee, Wisconsin, where I was employed as a draftsman on structural work, remaining there until the early part of 1897. In March 1897, I became Superintendent of Distribution for the Milwaukee Gas Light Company, which position I held for about one and one half years. During this time I had charge of main and service work for this Company. Subsequently, I was employed in general engineering at the Gas Works of the Milwaukee Gas Light Company doing general designing, and also designed and superintended the construction of the foundation for a three million cubic feet gas holder at the new plant of this Company in Milwaukee. This new holder was located on marshy ground, necessitating a study of the soil, the making of borings and piling work. In June 1899, I went to Denver, Colorado, as Superintendent of the Gas Department of the Denver Gas and Electric Company. While in this position I had charge of the operation and extension of the Gas Plant in Denver, including charge of coal, water gas and Pintsch Gas plants, and the distribution systems. During the time I was at Denver I made an examination and engineering report for prospective purchasers of the Gas Plants at Leadville, Boulder and Greeley, Colorado. During this time also, and during the year 1902, I made the drawings and specifications for remodeling the Gas Plant at Pueblo, Colorado, including the construction of the new water gas plant. During 1902, also, I was employed on engineering work in connection with the proposed improvements of the gas works at St. Paul, Minnesota. In March, 1903, I went to St. Louis, Missouri, as engineer of the Laclede Gas Light Company,
1298 which supplies all the gas for that city. In this capacity I had charge of the coal, water and Pintsch Gas plants and gas distribution systems, together with the electric plant and distribution systems of The Laclede Gas Light Company. I was in St. Louis for about six years and during this time was in charge of the designing and constructing the improvements to the plants and distribution systems of that Company, aggregating an expenditure of about seven million dollars. Among the work thus designed and carried out was the construction of a four million cubic foot gas holder; additions to the water gas plant of an approximate capacity of ten million cubic feet per day, together with the necessary apparatus and machinery; the designing and construction of a high and low pressure gas distribution system, including the designing and construction of about five hundred miles of gas mains and approximately sixty thousand new service and meter installations. During this time I designed and also had charge of the construction of a large Pintsch Gas Plant at St. Louis, capable of supplying gas, and actually doing so during the World's Fair in 1904, to more

than one thousand railroad passenger cars per day, together with a new distribution system for the same; also the improvements of the electric plant and distribution system were in my charge during this period. During the time I was engineer of The Laclede Gas Light Company, one hundred eighty acres of ground were purchased and I designed the general plans for a combined coke oven, coal gas and water gas plant to a total capacity of about one hundred million cubic feet per day. During the time I was in St. Louis
I made reports as Consulting Engineer for prospective pur-
1299 chasers of various gas and electric properties. Among the
gas properties were the following: Ardmore, I. T. 1905; East St. Louis, Illinois, 1905; St. Charles, Missouri, 1906; Little Rock, Arkansas, 1906; Collinsville, Illinois, 1907; Gas Plant Improvements, Toledo, Ohio, 1907; Hamilton, Ohio, 1907—employed by City—Hannibal, Missouri, 1908; Granite City, Illinois, 1907-1910.

Among the combined gas and electric properties were the following: Belleville, Illinois, 1905; Western United Gas & Electric Company Properties, namely, Elgin, La Grange, Aurora, Joliet, and twenty or more smaller places. La Crosse, Wisconsin, 1906, Street Railway also; Louisiana, Missouri, 1906; Nevada, Missouri, 1907—Water and Street Railway also; Cape Girardeau, Missouri, 1908,—Water also; In addition to these I made complete investigations and reports on the problem of supplying natural gas to St. Louis from the Kansas and Oklahoma gas fields, which involved a considerable amount of investigation and research work. I also designed and made complete specifications for a new coal and water gas plant at Beloit, Wisconsin, and a new electric plant at the same place. I also designed and furnished plans and specifications of the new electric plant and distribution system of the Merchants Power Company of Memphis, Tennessee. I also designed and partially built a complete gas plant, electric plant and distribution system at Davenport, Iowa. In April 1909, I left St. Louis and opened an office as consulting engineer in Chicago. Since then I have been employed as the regular Consulting Engineer of the Oshkosh Gas Light Company, embracing the designing and construction of all improvements of the gas and electric supply at Oshkosh, Wisconsin, as well as being in general charge of the operation of their
plants. I have been employed in the same capacity by the
1300 Beloit Water, Gas & Electric Company of Beloit, Wisconsin,
and also by the Greeley Gas & Fuel Company of Greeley, Colorado. Since entering into the consulting field I have made reports on various gas and electric properties, among others as follows: Anderson, Indiana, 1909, designing new plant and purchasing holders; Atlantic City, New Jersey, 1909; Lansing, Michigan, 1909; Litchfield, Illinois, 1909; Wilmington, Delaware, 1909; Amarillo, Texas, 1909-1910, water also; Galena, Illinois, 1910; Helena, Arkansas, 1910; Poplar Bluffs, Missouri, 1910; Waterloo, Iowa, 1910; Dayton, Ohio, 1910, natural gas also. I have also been employed as expert engineer by the Minneapolis Gas Light Company in the matter of service regulation. In the spring of 1910, I

was employed by the Southern California Edison Company (electric) to design and report on all improvements required for the coming five years in the plants and distributing systems of the eight gas companies owned and operated by that Company in Southern California at that time. I am making a detailed appraisal of the property of the Peoples Gas Light & Coke Company of Chicago, being employed on this work, the total value of their property aggregating many millions of dollars. I was also employed by the city of Wheeling, West Virginia, to investigate the conditions and design improvements for the gas plant and distribution system which is owned by the Municipality of Wheeling. At the present time I am employed by the Public Service Commission for the First District of New York City to investigate and report on the gas pressure conditions in New York City and to make recommendations required to give New York City first class pressure service. Recently, 1911, I have been further employed by the City of
1301 Wheeling, West Virginia, to build their new gas plant and rehabilitate their distribution system, as per my report made to them in 1910. Also very recently, 1911, I have been employed by the City of Buffalo, New York, to investigate and report upon the operating conditions and expenses of the Buffalo Gas Company, supplying the artificial gas to that city, with a view towards determining what economics, if any, could be effected by the installation of labor saving machinery. I have just finished an employment by the Kings County Lighting Company of Brooklyn, New York, on a rate regulation case before the Public Service Commission for the First District of New York. I am at present engaged in making a complete valuation and determination of both gas and electric light and power rates in Oshkosh, Wisconsin, being retained for that purpose by the Oshkosh Gas Light Company.

Q. Up to 1909, when you opened your office in Chicago, you had what to do in connection with the operation of these plants you have spoken of?

A. I was in actual charge of the operation as well as construction and designing.

Q. What do you mean by saying actual charge, were you manager of the plants?

Mr. Byers: It seems that paper fully qualifies the witness.

Q. What I want to get at in a general way is the nature of the duties which you performed in operating these plants, so as to indicate what knowledge you have as to the actual operating.

A. I think I can probably answer that question best by stating that at Denver I was superintendent of the gas department, and I went to the gas plant and the other places where it was my duty to visit each day, and at the gas plant I investigated each opera-
1302 tion each day, looked over the results for the preceding day and directed such changes as were necessary to make in my judgment, to improve results, if that could be done. When I went to St. Louis, that being a considerably larger city, it was impossible for me to visit each gas plant each day, but I made it a point to

visit all the plants of the Company several times a month, and each day I conferred with all the superintendents of the different plants as to the operation, and went over the results of the preceding day and determined personally the changes that were requisite in the future operations to secure further economy, of that were possible.

Q. Now, have you made a valuation of the property of the Des Moines Gas Company, the complainant, in the city of Des Moines, consisting of its manufacturing and distributing plants in the city used for the purpose of furnishing gas?

A. I have.

Q. When did you first come to Des Moines?

A. I came to Des Moines first about the first of January 1911.

Q. Was that the first time that you had received any information, or at least any observation as to this plant?

A. It was.

Q. Now, then, tell us what you have done, how much time you spent in Des Moines, and what you did in the way of examining this particular plant?

A. My first visit to Des Moines, was about January 1st, and at that time I was here two days only, being very busy and being required to leave on other work on the evening of the second day. During these two days I made an inspection of the gas plant by going through each building and noting all the apparatus, and subsequently made a tour of the city, driving to the outskirts in
1303 several directions and being advised generally of the extent of the distribution system. At that time I made an approximate determination of the valuation of this property. Subsequently I came to Des Moines, I think some time during February—I prefer to refresh my memory on that particular point because I have a note as to when I came—I find I was here three days in the early part of February, from the 6th to the 8th inclusive, and again in Des Moines on February 26th to March 9th inclusive. At these subsequent visits I went into the question of the inspection of the plants more thoroughly and made determinations of the cost of doing the work and the cost of materials in Des Moines, and made a very careful check of a copy of an inventory of the property of this company, which was handed to me by the company.

Q. Now, let me interrupt you a moment—this copy of the inventory is a copy of Exhibits 15 and 16?

A. I believe it is a copy of those exhibits.

Q. Except as to inaccuracies Mr. Lea called attention to amounting to about fourteen dollars?

A. Yes, sir.

Q. Now, then, go on and state what you did in the way of checking the accuracy of this inventory yourself?

A. With one of my assistants I went into each building and measured each building and measured the thickness of the walls and the *the* sizes of windows and door openings; measured the height of the walls of some of the buildings only, but I took enough measurement to satisfy myself of the substantial accuracy of the inventory in regard to the buildings. In regard to the apparatus I went over

the list of the apparatus as noted in the inventory and checked
1304 each piece of important apparatus personally and noted that the size and description of the same corresponded with that furnished in the inventory. That is about all the checking I did.

Q. Did you do anything in the way of checking up the distribution system, if so, what?

A. I did nothing in the way of checking up the distribution system accepting the inventory of the company as correct in that particular.

Q. What was the result of this checking of the buildings and apparatus?

A. I found that the measurements were correct as set forth in the inventory, and that the apparatus as listed therein was actually at the Gas plant of the Des Moines Gas Company, and that the description, size, name, manufacturer etc., corresponded to the description, etc., in the inventory.

Q. Please state whether or not you proceeded to make a valuation of the property of this complainant company in the city of Des Moines, used and useful in its business of manufacturing and distribuiting gas there?

A. I did.

Q. Have you copies of your report?

A. Yes, sir. (Witness produces copies.)

Q. I wish you would state whether the report marked complainant's Exhibit 21, is your estimate of the cost of reproducing this plant?

A. It is.

Q. Now turning to page one, which immediately follows the index, you have first here some explanatory matter, part of it you have already covered; what do you mean by the statement unit costs were fixed to each item covering cost of material and wages?

1305 A. By unit cost I mean the cost of a unit quantity of material usually in place. For instance, concrete is usually estimated at so much per cubic yard, and I determine what would be a fair price per cubic yard of concrete, in place, in Des Moines.

Q. As of the date of this appraisement?

A. As of the date of this appraisement.

Q. Was that followed out, for instance, with reference to brick and lumber and various other things involved of that character?

A. Yes, that same system was carried throughout the brick work, excavation, roofing, hauling, all of the usual features that are incident and a part of the construction work of this kind.

Q. Now, stopping here for a moment, Mr. Baehr, I wish you would tell the Master whether this method of obtaining unit prices figured at, what you call a basic cost, and then add those various other items, is the method usually adopted both by engineers and contractors in estimating costs of work?

A. It is.

Q. What did you do with reference to laying out the work and determining what part of it would be done in each year and why did you do this.

A. The date of this valuation was assumed as of January 1st, 1911. I estimated that on this date some mind would conceive the idea of supplying Des Moines with a gas plant; I did this in order to logically reproduce this property. The necessary steps to go through to reproduce a property and business of this kind from its inception to a completed state, were assumed about as follows: To start with, during the first six months of the history of this construction, it is assumed that a preliminary investigation would be made, to look over the city of Des Moines as a field for gas for a gas
1306 company, which would be followed by an engineering investigation to determine the advisability of constructing a gas plant in this place and developing the gas business here. The first six months would be consumed by work of securing the franchise, the necessary time and effort consumed in arranging and financing of an enterprise of this kind, the determination of a proper site and optioning of real estate, naturally the service of an attorney at law would have to be arranged for, and the spirit or mind conducting this enterprise would lay out an organization to handle it, not only the construction work but to carry on the office end of the business. Now I estimated that it would fairly require six months to carry out that portion of the work. I further estimated, thereupon that about the first of July 1911, in other words, six months after the date of valuation that the real estate would be purchased, that the business and engineering departments would be organized as rapidly as possible; that an office would be rented and the various heads of departments would begin to arrive and that the organization would begin to assume form. Also that the general legal and financial organization would be completed during the last six months. Now as soon as the engineering department is organized, it would proceed to undertake the usual and customary work of an engineering department of that kind, would undertake, such as an investigation of the real estate, the laying out of the plant, making detailed plans, securing prices of purchase, etc. This work of engineering is figured and estimated not to be completed in the six months, but to continue throughout the construction period to a more or less extent, as required to carry on that work. Then I estimated that actual work would begin about the first of January, 1912;
1307 in other words, about one year after the inception of the enterprise. I figure this is a fair period to allow for the necessary work to be undertaken preliminary to actual construction. Thereupon the rate of construction is estimated to be carried on with a view toward the utmost economy. If you would consider a man investing his money in an enterprise of that kind, he would naturally be desirous of completing his construction and getting into operation and securing a return at as early a date as possible and keeping in mind the reasonable amount of work that can be done economically and fairly, I have estimated the rate of work as contained in this report.

Q. Now, on page one, I think you referred to this rate of work under a division; how you got at it by dividing the work into districts?

A. Yes; the distribution system is a very expensive feature of

work of this kind and it requires careful study to lay out the amount of work that should be done in a given length of time in order that that work may be economically and reasonably possible. I assumed and estimated that it would be reasonable and fair to carry out the amount of the distribution work in Des Moines in three years, and there being about 180 miles of main, all told, I estimated that it would be reasonable to figure to lay approximately one-third of that amount of mains each year. For that reason I divided the city into three districts, and these districts are so divided that the amount of work in each is approximately the same—the mains in each district and services in each district and the rate of installation of meters are given in this report; but approximately one district is completed per year, with the exception of the meters, which
1308 are not fully installed in each district in the year mentioned, but the rate of installation of meters is shown in the table in this report. These districts correspond with the districts shown on the map in one of the earlier exhibits submitted by you—I have forgotten the exhibit number.

Q. That is in Exhibit 16, plate #33. Are these districts indicated on the plate which has been referred to in Exhibit 16 as plate #33?

A. Yes, sir.

Q. How are the first, second and third indicated?

A. The first district is marked one, the second is marked two, and the third district is marked three.

Q. You refer to beginning work in 1912; there is a reference here on page four to river crossings?

A. The river pipes would have to be laid—I understand during the winter months the water is low and I understand that you can estimate that during the winter months you always find the water low to do this character of work to the best advantage—for that reason I estimate that the river piping work would be begun in the winter of 1911 and 1912.

Q. And what have you estimated the rate of expenditure each year, whether it is uniform or not?

A. During each year, I estimated the rate of expenditure would follow a straight line, from the beginning to the end of each year, and that is practically true.

Q. What do you mean by following a straight line; we don't know, we don't think by lines?

A. I mean that the expenditure in the last half of the year would be practically the same as the expenditure the first half of
1309 the year and for that matter that the rate of expenditure each month would practically follow the same kind of a curve if plotted on a sheet of paper; by curve in this instance I mean a straight line.

Q. When did you estimate the plant would be completed?

A. I estimated that the entire physical equipment, that is the plant and the distribution system would be completed and in operation on and after January 1, 1915.

Q. And when would you first begin to supply gas?

A. I estimated we would first begin to supply gas on January 1, 1913.

Q. Now, Mr. Baehr, what do they call this method of valuing a plant?

A. It is called the reproduction method.

Q. Why have you adopted it?

A. I have adopted this method because in my opinion it affords the best test upon which I can base my judgment of the value of this property.

Q. And what is the fact as to whether it is a standard method and used by engineers generally?

Objected to on part of defendants as being incompetent and not a matter of expert testimony.

A. It is a method which is in general use.

Q. On what basis have you figured the taxes?

A. I ascertained that the tax rate in 1910 was ninety mills on one dollar on twenty-five per cent of a full valuation. I changed that rate, or reduced it rather to the rate on a full valuation, which is equivalent to a rate which is two and one-fourth per cent per year on a full valuation, and that is the figure I used.

Q. Now, turning to page 5 of your report, we will take up
1310 these overhead matters first in the order you have them; what do you mean by items of additional cost?

A. By items of additional cost I mean those portions of the cost of carrying on an enterprise of this kind over and above the cost of material and wages entering into the actual construction.

Q. Then the material and wages are not the only items of cost that enter into the actual construction?

A. They are not.

Q. You take up the first here, what?

A. I first take up what I call item #1, contingencies.

Q. You have the words on base only; who do they mean?

A. The cost of material and wages I call in this report a base figure. Now, contingencies I apply to the base figures only, contingencies being estimated as a percentage.

Q. By saying you apply to the base figure only, you mean you apply them before you add taxes and things of that kind?

A. Yes.

Q. What per cent do you add on account of these contingencies?

A. I apply contingencies only to certain portions of the property; that is, the construction work; there is no contingency on real estate; meaning by that the gas works, on mains and services and on meters in use I apply contingencies at ten per cent on the base figure for those parts only; on meters not in stock, no contingencies.

Q. The plant as you used the word in this Exhibit 21 means the manufacturing plant then?

A. Yes.

Q. Not the entire property of the company?

A. No, not the entire property.

1311 Q. Now, please state whether or not on page 7, you explain in detail some of the items that are included in this matter of contingencies?

A. I do.
Q. And it is under that head?
A. Yes.
Q. Now what have you allowed on account of contingencies?
A. In dollars?
Q. No, per cent.
A. Ten per cent on the plant, meaning gas works, mains and services and meters in use, using the base figure.
Q. Why do you adopt ten per cent?
A. Because ten per cent is the result of my experience in doing construction work of this kind. I have found in the number of years I have handled construction work and been in charge of construction work of this kind, that there were always items of cost entering into the final cost which were not foreseen at the time the work was originally planned and estimated. These contingencies as I call them, varied in amount, in some cases running as low as ten per cent, in other- they run very high; but from the experience I have had and being in actual charge of this construction, I estimate that ten per cent is a conservative and fair figure to use in this case.
The MASTER: Is this per cent estimated upon the entire cost of the meter or on the laying of it?
A. That per cent is estimated on the cost of the meter in place; that is, base figures only.
The MASTER: I mean the cost of the meter and the cost of placing?
1312 A. Yes, sir.
The MASTER: And in the same way with the mains?
A. The same way with the mains.
The MASTER: And the same way with the plant?
A. Yes, sir.
The MASTER: That ten per cent goes under cost of construction and the cost of material both?
A. It goes upon the cost of material and wages entering into the cost of any portion of the plant, or the whole of it, and the mains, services and meters in use.
Q. Now, turn to page 7. What are some of the things you take into account here that are covered by this ten per cent?
A. In the first place, that ten per cent covers among other things, omissions. In a case like the one under consideration omissions are not as serious as in cases where the inventory would be made with less care and less completeness. In this instance the inventory has been made with great care and with great completeness and the omissions are not as serious here as might be the case elsewhere. But there are bound to be omissions and I have covered omissions, whatever they are, under this item of contingencies. I might instance that by stating that in Chicago, where a very careful inventory of the property of the Peoples Gas Light & Coke Company was made, I subsequently checked the inventory and personally found some omissions, even with the great care they had used, and for that reason and because of my experience in this matter I feel

that a certain allowance for omissions must be made and is fair to make. Now, under contingencies I also cover the item of temporary work. In building a plant of the size of the one in Des
1313 Moines, or even plants that are much smaller, there is always a certain amount of temporary work which disappears after the completion of the plant, and that work therefore is not found in an inventory which is made subsequently to the completion of a plant. Yet that work has cost money, and it is only fair that an allowance for it be made. I might instance that by giving one experience we had in building a four million cubic foot holder at St. Louis. After the work was practically completed and the holder was ready to test, it was necessary to erect a temporary building and put in an electric moter and blower, run in wires and run a pipe and pump air into that holder for the purpose of testing it. When the holder was completed that was taken out and disappeared, and if an inventory of that property were made today, no trace of that work would be found. For that reason it is proper to allow something for temporary work. Now, the next item that I have included in contingencies is the item of piece-meal construction. Piece-meal construction is very high for certain portions of the work, and again in other portions of the work it is not so high. When you consider a plant like the gas plant of the Des Moines Gas Company, you will realize at once that this plant has been built up a portion at a time, and it always costs more money to build a plant a portion at a time than it would cost to rebuild that plant in its entirety at one time as one large construction undertaking. Now, if you consider the subject of mains in a gas plant—mains in a gas plant are extended to some extent by piece-meal construction. You may have a house which is only fifty or seventy-five feet beyond the end of the mains and you come and apply for gas and the company is obliged to undertake the construction of a main extension of
1314 only fifty or seventy-five feet in length, has to go to some extra expense over and above what it would be obliged to go to if it laid the entire main system in one large construction undertaking. From my experience and in my judgment it is fair to allow something in plants of this kind for piece-meal construction. Now the other features that enter into contingencies are such features as are enumerated on page 7 there, which I may state are changes in construction made necessary by encountering unfor-seen obstacles during the progress of the work—rise in prices of labor or materials above normal, financial panics; financial panics may result in extreme difficulty in getting money to carry on the work; the work might even be stopped; this would result in an increased construction cost. Inclement weather is a source of considerable contingency; then there are other causes, such as floods causing both delays and actual property loss; failure of contractors, special unfor-seen difficulties, deep excavations, strikes, and as I have stated here in general, all those costs, experience has shown, must be provided for by prudent men engaging in large construction enterprises, over and above those which can be specifically enumerated.

Q. Now, your next item, additional cost on page 5 is what?

A. That is item #2, called engineering and superintendence, and

that is figured on base plus number one, which means it is figured on the base figure, namely, cost of material and wages, plus contingencies.

Q. What does this include? Is that detailed, commencing near the bottom of page 7?

A. Yes, at the bottom of the page there.

Q. State generally what you cover by that?

1315 A. Generally, salaries, wages of engineers, superintendents employed on the work, the preparation of detailed plans and specifications, receiving bids, preparation for letting contracts, purchase of material, supervision of work, the adjustment of contracts, final tests of machinery to see that it fulfills the specifications and requirements of the contract, investigation of real estate, determination of proper location of plant, etc.

Q. How much have you allowed on account of this item?

A. On real estate I have allowed 1.5 per cent; on plant, meaning gas works, mains and services and meters in use, I have allowed five per cent.

Q. What on meters in stock?

A. On meters in stock nothing.

Q. Now I wish you would state whether this is a fair and reasonable allowance on this account of this item of cost?

A. In my judgment this amount is a very fair amount to allow, and there are many instances where engineering work goes at a higher percentage then I have taken. I think this is fair in this instance.

Q. Now your next item is what?

A. Number three, legal organization, liability for casualty and fire insurance. I have lumped those items under one head of number three. They are figured on base only.

Q. Have you stated in a general way the latter half of page eight, what is included here?

A. I have, beginning with the words investigation expenses.

Q. Now on page 9, what do you do?

A. In order to determine a fair and reasonable percentage for this item #3, I made an estimate as shown on page 9 of the

1316 items that would enter into this item of legal expense and organization, and that is found detailed on page 9. The percentage which I finally adopted is considerably less than the detail shown on page 9, because I wanted to be conservative and fair in this item.

Q. Now, your estimate of what this item would actually amount to went to what?

A. The item #3 I estimated would run $116,776.

Q. What did you actually allow in making your estimate of the reconstruction cost on account of this item?

A. I actually took a percentage which amounted to $90,444.

Q. About $26,500 less than the actual cost as you figured it?

A. Yes, sir.

Q. Now, what is the fourth item of additional cost?

A. The fourth item of additional cost is taxes during construction, which is figured on the base, plus items numbers 1, 2 and 3.

Q. Why do you figure it on the base plus items number 1, 2 and 3?

A. That is plus contingencies, engineering, organization and legal expenses, because those items number 1, 2 and 3 are a portion of the work of construction just as much as the physical material entering into the same; and the taxes I figured on the full valuation.

Q. Now, on page 6, is there some detailed statement of what you have given us about the computation of taxes?

A. Yes.

Q. And this is also explained on the first half of page 10?

A. That is also explained on the upper part of page 10.

Q. Now, what is your next of these items of additional cost?

A. Number 5, which I have called interest during construction. This interest added to the capital account is figured on base
1317 also number 1, 2, 3 and 4, meaning by this the items of the table shown on page 5.

Q. That is figured on the actual expenditures?

A. Yes.

The MASTER: Taxes on prior year, however, is so included; what do you mean by that?

A. I figure that the taxes are levied one year and paid the next. I have included the tax levied each year in the same year as accruing on that same year; but in the particular year under consideration I have not figured taxes.

The MASTER: Don't you mean following there instead of prior?

A. No, I mean prior, because if you assume, for instance, the tax of 1912 in the interest calculation for the year 1912, I have not figured interest on the taxes accruing in that year, but I have figured interest on the taxes for the year prior, 1911.

Q. Turn to page 10—is this explained in the latter half of that page?

A. Yes, beginning with interest during construction.

Q. What is your next of those additional items?

A. The next item is #6, working capital.

Q. Where do we find that, explain it?

A. It begins on the bottom of page 10.

Q. In a general way what does it include?

A. In a general way that includes material, supplies in stock, and a fair amount of cash to carry on the operation of the business.

Q. You stated at the bottom of page 10 how you arrived at that?

A. Yes, sir.

Q. Now what is the next of your additional items?

1318 A. The next item #7 is going value.

Q. Have you stated in a general way on pages 12, 13, 14, 15, and part of 16 how you compute that?

A. These pages simply comprise some general consideration leading up to going value. They do not explain in detail the method I finally based my judgment of going value upon.

Q. We pass that, at least for the present, until we get to that subject. Now what have you set out on page 17 of Exhibit 21?

A. Page 17 shows a summary of the reproduction new and present or depreciated values of the property of the Des Moines Gas Company, together with an estimate of the average condition per cent of the physical property.

Q. Now, turning to pages 18, 19 and 20, there is a single page so marked?

A. Yes.

Q. What have you set out on that page?

A. On the page marked 18, 19 and 20, I have set out the reproduction new value of the physical property and business, giving the reproduction new value of the base figures with items of additional cost and the total.

Q. And these items of additional cost here are lumped in the aggregate?

A. They are in this table.

Q. In the succeeding page, 21, please state whether this base cost is given and the amount of the items of additional cost separated into taxes, interest and items 1, 2 and 3, which cover I believe as shown on page 5, your contingencies, engineering, superintendence, legal organization, liability for casualty etc.

A. They do, on the basis of reproduction new.

1319 The MASTER: That omits the going value.

A. Yes, sir; that is just an analysis of the items of additional cost which are not applicable nor applied to working capital and going value.

Q. This page 20, as I understand you, is simply giving in more detail the totals of those items of additional cost which appear on pages marked 18, 19 and 20?

A. Yes, sir.

Q. Now, passing to page 22, that is what?

A. On page 22 is shown a schedule which I estimated to determine the amount of the investment going into operation each year. To explain that a little further, you will note there is no portion of the investment charged into operation during the years 1911 and 1912, for the reason that gas is not turned on until January 1, 1913. The construction work is not entirely finished on the date the gas is turned on, but certain portions of it are constantly being finished and as fast as they are finished it is fair that tax and interest chargeable to the capital account should cease. For that reason I have made a careful estimate of a portion of the investment going into operation each year.

The MASTER: On the first of January each year?

A. That is at the end of each year.

The MASTER: For the prior year?

A. Yes.

Q. For instance, you have 1913, that column would indicate the portion of the investment used in operation at the end of 1913?

A. No, during the year 1913.

Q. At the end of 1912?

A. Yes.

1320 Q. And 1914 in the next column is used in the same way?

A. Same way, yes sir.

Q. Now, what does the next page show, page 23?

A. Page 23 gives the portion of the investment in operation during each year in dollars on the basis of reproduction new, not including taxes and interest.

Q. Turning to page 27, what is that?

A. Page 27 gives the detail of the method of figuring taxes and interest which are chargeable to operating expenses only on the basis of reproduction new. That particular table refers to the expenditure of a portion of the table shown on page 24. In other words, the table on page 24 shows the computation of taxes and interest chargeable to the capital account, but that particular page, 24, does not show the portion of taxes and interest which go to operation. Page 27 explains one portion of these figures going to operating expenses.

Q. And stopping a minute at page 24, that gives what?

A. Page 24 is a summary showing the estimated expenditures by years on the basis of reproduction new. This table is made largely for the purpose of showing the amount of taxes and interest chargeable to the capital account. I have not taken the taxes and interest chargeable to the capital account item by item, but have based it on the summation of items as shown in this table.

Q. And do pages 25 and 26 as well as page 27 show the details with reference to computations which are contained in the summary on page 24?

A. They show the detail of the computation as relating to taxes and interest; show how each figure is derived.

1321 Q. I think we will turn, Mr. Baehr, to your cost of reproducing this property as you have it in detail; that is your base figures.

A. Page 72 is the summary.

Q. Now the first item you have there is your real estate?

A. Yes, sir.

Q. Now what did you take as your base value of real estate; what does that mean and where did you get your information?

A. The base figure on real estate which I took is $200,000. I made no investigation of the value of the real estate owned by the Des Moines Gas Company, but the Company informed me that some real estate experts in Des Moines had given them valuations of this real estate and that those valuations were somewhat in excess of $200,000. I took for my base figure as a result of that information the amount of $200,000 and at the time I investigated the number of square feet of real estate as shown in the inventory to be 196,358 and I find that at $200,000 base figure value of real estate this amount equals $1.02 per square foot; that value appeared to me to be reasonable and I have used it in my calculations.

Q. Turning now to page 72 again we have real estate base two hundred thousand dollars.

The MASTER: You don't consider this man an expert on real estate.

Mr. GUERNSEY: I was going on to have him explain the basis on which he had taken his figures.

The MASTER: The fact of the matter is I wouldn't consider the testimony of either one of them on the value at all.

Mr. GUERNSEY: That item goes into his total valuation and I wanted him to explain how it goes in.

1322 Q. Mr. Baehr, referring to this table on page 72, you have first base $200,000, then you have under the next column 1, 2 and 3, what does that mean?

A. The 1, 2 and 3 refers to item numbers detailed on page 5, one being contingencies, two being engineering and superintendence, and three being legal organization, etc. Now this amount of eleven thousand dollars is the one and one-half per cent for engineering and superintendence and the four per cent for legal organization, liability for casualty and fire insurance, but not any allowance for contingencies.

Q. That gives you the aggregate on account of real estate contained in your valuation as what?

A. $229,229.

Q. That is carried into a summary on page 126, is it?

A. That is shown on the top line of page 126.

Q. Now, then, going back to page 72, you have your next item there, plant, as what?

A. The base figure of plant $469,517. on the basis of reproduction new.

Q. The additions bring it up to what amount?

A. The additions on the same basis bring it up to $603,675.

Q. Now that plant includes the buildings, contents, outside apparatus, holders, tanks and sundry equipment?

A. Yes, sir.

Q. And the aggregate there of $469,517. which with the additions comes up to $603,675. on page 72 is distributed into these items I just mentioned on page 73?

A. It is.

Q. Now on page 74 and page 75 we have a large number of items which make up under the head, base $469,517. and under the total $603,675. I wish you would state whether these are *are* more in detail the items which go to make up the amounts sum-

1323 marized on page 73.

A. They do.

Q. Now, then, turning to page 74 you have first buildings?

A. Yes, sir.

Q. And they are all included together; I wish you would turn to page 76 and state whether there you give the base and the additions and total of the reproduction new value of each one of the buildings?

A. I do.

Q. For instance, I wish you would state what your estimate is of the base amount of the building known as #1-A and B purifying house.

A. The base figure on the basis of reproduction new is $9,501.

Q. What are the additional items to be added on account of items 1, 2 and 3?

A. Items number 1, 2 and 3 cover contingencies, engineering and superintendence, legal expense and organization, and amount to $1,853.

Q. The taxes?

A. The taxes are the proportion of taxes chargeable to the capital account; as proportioned to this building, amounting to $235.

Q. So that the total reproduction cost of this building is what?

A. $12,217.

The MASTER: Why can't we shorten this some way.

Mr. BYERS: I have no objection.

Mr. GUERNSEY: I was going to ask a general question now.

Q. I wish you would state whether on this page, 76, you have listed each one of those buildings and have shown your estimate of the base and the additions on account of these various items you have referred to, and the total reconstruction cost of that building, whether in your judgment those estimates are reasonable, fair and correct?

1324

A. The buildings shown on pages 76 and 77 and these figures in my judgment represent fair values of the buildings and in my judgment are correct.

Q. Taking these totals on page 77, I wish you would state whether they are carried into the summary on page 74?

A. The total buildings shown on page 77, rather the totals are shown as the top line of the table on page 74.

Q. And opposite the word what?

A. Opposite the word buildings.

The MASTER: They are not included on 72?

A. They are shown separately as the top line on page 73, but the table on page 72, the buildings are included under the heading plant.

The MASTER: As $603,675.

A. Yes, sir.

Q. Now, then, your next item here on page 74 is contents, building one, A. and B?

A. Yes, sir.

Q. Now turn to page 78, and I wish you would state whether that page shows the various items there referred to, the base cost and the additional items, and the total reproduction cost new in your judgment, shows it fairly and accurately.

A. It does and in my judgment is a fair figure and accurate.

Q. And then the figures shown on page 8 appear on page 74 opposite the classification contents of building 1-A and B.

1325

A. They do.

Q. They go into that summary there?

A. Yes, sir.

Q. Now the next is building 3; on page 74; I wish you would turn to page 78½ and state what that is?

A. Page 78½ and 79 together give the detail of the contents of building #3 on the basis of reproduction new, and the sum-

mation of those figures appears on page 74 opposite contents building #3.

The MASTER: That is the new plant?

A. That is on the basis of reproduction new, yes sir.

Q. Now take the next item on page 74, contents building #4, and state whether or not the details as to that item are set out on page 80?

A. Those are shown on page 80.

Q. And the totals as they appear on page 80 as to those items constituted those items on page 74?

A. Yes, sir.

Q. Now what is the fact as to page 81 showing in like manner your estimate of the value of contents of the building #5?

A. It does.

Q. And these totals are carried to page 74?

A. They are.

Q. Now turning to the next item, page 74, contents building 6-A and B please state whether or not page 82 shows details as to those items?

A. It does.

Q. And the totals as they appear on page 74 are taken from page 82?

A. They are.

Q. Now, the next item, page 74, is contents building 6-C.

1326 I wish you would state whether page 83 shows the details of your estimate as to the value of this item?

A. It does.

Q. And the sums of those details are carried to this item on page 74?

A. They are.

Q. Now the next item, page 74, is contents of building # 7?

A. Yes, sir.

Q. Please state whether page 84 shows the detail of this base $45,651 and also shows the details which make up the balance of these items, contents of building #7, page 84?

A. It does.

Q. Now referring to the remaining items which are shown on page- 74 and 75, making up the aggregate total of $603,675 with the items that have been referred to, I wish you would state whether the details of these items are shown on pages 85 to 112 inclusive of your report Exhibit 21?

A. Yes, sir.

Q. And this item $603,675 then goes from page 74 to page 73 and from there into your summary on page 72?

A. Yes, sir.

The MASTER: Mr. Byers, you have no objection to this general question?

Mr. BYERS: Absolutely none.

Q. Now referring to all of these pages, Mr. Baehr, will you please state whether each item as you have given it there, in your judg-

mnt is a fair and reasonable item based upon a fair and reasonable cost of reproducing the specific piece of property which it refers to?

A. It is.

1327 Q. Now, then, turning back again to page 72 your next item after real estate and plant is distribution?

A. Yes, sir.

Q. That shows base 1,551,202 and a total of 1,993,243?

A. Yes, sir.

Q. Now, I wish you would state whether there is a summary of the items making up these totals on page 113 of your report?

A. There is.

Q. And does this summary show as to the items classified generally there, as to each class, the base and additions on account of items which you have indicated, items 1, 2 and 3, and on account of taxes and interest and the total?

A. Yes, sir.

Q. Now, your first subhead here is street mains?

A. Yes, sir.

Q. Taking these various items and not stopping for that one, street mains, river pipe, paving over mains, street mains, valves and drips, steam and street railroad crossings, house services, lamp services, paving over services, meters in use, meters in stock and distribution, tools, I wish you would state whether pages 114 to 123 inclusive of your report show as to these items the details, showing the base and the additional items which you have mentioned, and the total.

A. They do.

Q. So that the totals contained upon page 113 are made up from the items which appear on the subsequent pages up to 123 inclusive?

A. That is right.

Q. And these together make up the total show- as distribution system on page 72?

A. Yes, sir.

Q. I wish you would state generally as to the items going into the distribution system, whether they show in your judgment the

1328 fair cost of reproduction new of this system and show fairly the actual value of the separate items going into it?

A. They do as of the date of this valuation.

Q. Now, the next item you have on page 72 is what?

A. The next item is marked general office and stable equipment.

Q. Will you turn now to page 124 and state to what extent you have itemized this item?

A. I have divided that among furniture and fixtures, book records, and stable equipment.

The MASTER: Is the outside apparatus included in the total?

A. That is included under the heading of plant.

Q. How do you place your valuation on these items and how do you get at it?

A. The item of furniture and fixtures is the equipment of furniture and fixtures at the general office of the company, and that base

figured $14,015, was arrived — by me as a fair figure to represent the value of that particular equipment on the basis of reproduction new from an inspection of an inventory of said furniture and fixtures furnished to me by the company together with a statement, meaning verbal statement, of the value of one or two of the principal items.

Q. How old were these furniture and fixtures?

A. They were very recent.

Q. Now how did you get at the next item?

A. The book records I have taken base figure on the basis of reproduction new, of ten thousand dollars which in my judgment is a fair and conservative estimate of the value on the basis of reproduction new on the date of this valuation of the book records owned by the Des Moines Gas Company. I did not include under
that heading drawings or portions of the works or maps of the
1329 distribution system, the value of which I included under
the heading of engineering and superintendence, but this particular item of ten thousand dollars base figure covers the other records of the company, such as for instance history cards and the general business records. I think the figure is conservative and fair.

Q. What is the final item on this page?

A. The final item is stable equipment.

Q. How did you get at that estimate, the value of that?

A. The base figure $11,359, is my estimate of a fair figure of the stable equipment derived from an inspection of the inventory of stable equipment made by the company and handed to me. I have based my value on the information concerning the principal items contained in the said equipment. It is not the result of a detailed estimate on each item.

Q. What do you say as to whether it is reasonable or accurate or not in excess of the total reproduction new value of this item?

Objected to on part of defendants as incompetent and immaterial.

A. In my judgment this amount is conservative and fair.

The MASTER: What are the book records?

A. We will take the one thing, history cards——

The MASTER: They are the books of account?

A. Yes, sir; the books of account and the records relating to the business of the company.

Q. Why would they be of any value to a new plant if this plant was reproduced?

A. They would be of the greatest value; they contain the records
of the transactions of the company, the names of consumers,
1330 the locations and what has happened at those consumers'
places, the various transactions in a business way. I consider them of great value. I think that figure is if anything low.

Q. And these items shown on this page, 124, are carried into the summary on page 72 under general office and stable equipment?

A. Yes, sir.

Q. Now, Mr. Baehr, this summary of the plant and summary of

the distribution system, which take up pages 74 to 124 inclusive, say nothing about depreciation?

A. No, sir.

Q. What method did you take to ascertain the per cent condition at present of this plant, do you refer to this on page 125 of Exhibit 21?

A. Yes, sir. The condition per cent or the present value of buildings and apparatus or physical property of any kind were determined by a personal inspection which I made, a very careful inspection of each item. In a general way the per cent condition of those portions of the equipment which are under ground, like mains and services and that portion of the equipment called meters, I did not see and I computed their per cent condition on the basis of the composite life and age of these items.

Q. Now, turning to page 126 and the following pages, over to page 137 which is included, will you please state whether or not these pages state the cost of reproduction new of these various items as we have already found them, and show in addition to that the condition per cent and the present or depreciated value of each one of those items?

A. They do; they refer to the visible property.

Q. It is the items we have not been referring to heretofore?

A. Yes, sir.

1331 Q. Will you turn to page 17 and state whether or not under the headings real estate, plant, buildings, contents of buildings, outside apparatus, holders, tanks and sundry equipment, general office and stable equipment and distribution system you have summarized these items which are found in pages 126 to 137 inclusive?

A. Omitting the distribution system which you mention, they do.

Q. Before I get to the distribution system—now the plant and buildings includes quite a number of items and they have various conditions per cent as shown in detail?

A. Yes, sir.

Q. How did you obtain 84.8 condition per cent which you apply on this item on page 17?

A. The cost of the reproduction of the plant and building is shown as $86,924. The present or depreciated value $73,741 is taken from page 127. The condition per cent on page 17 of the plant and buildings was obtained by dividing $73,741 by $86,924. I wish to explain right here that the condition per cent as shown on page 17 is only to the nearest decimal. As a matter of fact if the condition per cent is wanted accurately it would have to be carried on to a number of decimals. To illustrate that difference, 84.8 carried out is 84.834.

Q. That is, carrying out individual instances would have increased the condition per cent somewhat and would have increased the depreciated value?

A. No, $73,741, is derived from page 127; that is not changed at all and the condition per cent is only taken on one decimal.

Q. Now, this distribution system that appears here on page 17 is taken from page 113?

A. That is shown on page 113.

At this time an adjournment was taken until 1:30 P. M.

1332 1:30 P. M. MONDAY, *July* 31, 1911.

WILLIAM A. BAEHR continued on direct examination by N. T. Guernsey, Esq.

Q. I think Mr. Baehr that just before luncheon you had stated that the tables of the distribution system appearing on page 17 you took from pages 113 and the following pages showing details as to that matter?

A. Yes, sir.

Q. And what is the fact as to whether as to each item of detail these things shown with reference to the distribution system commence at page 113 and continuing to and including page 123 are correct and accurate in your judgment?

A. They are.

Q. I think I have asked you that once before but if I did it won't do any harm. Now then turning to page 63 taking that and the following pages down to and including page 71 I wish you would state whether they show what in your judgment is the condition per cent of the items making up the distribution system and also show your method of arriving at this conclusion.

A. They do.

Q. Now taking page 63 for a moment there is a formula at the bottom of that page. From what did you derive that formula?

A. That is the regular formula used in compound interest calculations.

Q. In getting your present values what rate of interest did you take?

A. In this case I took four per cent.

1333 Q. Now turning to page 64 you have there in the first line street mains 930,746, then times renewed in 58.1 years' life. Why did you take 58.1 years, explain that, the basis for that column?

A. 58.1 years is the composite life of the street mains and that figure 58.1 is derived as shown on page 66. You will notice on page 66 that the estimated life of the mains two and one half inches and under is taken at 20 years and that the estimated life of three inch mains is taken at 30 years and four inch mains at 50 years and the 6 inch mains and the larger mains than six inch at 75 years. Referring to the table on page 66 you will find that I have a column, times renewed in 75 years. That is the way to determine the true composite life of the mains. It is estimated that the larger mains are renewed only once in 75 years, but the four inch mains are estimated to be renewed every 50 years. That means that the 4 inch mains are renewed one and one half times as often as 6 inch and larger mains. Therefore in order to determine the true composite life it is necessary to multiply the first column which on page 66

is reproduction new value, by the times renewed in the longest life main shown in that table, namely 75, divided by the life assumed for each item and that gives the column headed total expenditures in 75 years. Then to determine the dollar years you multiply the next to the last column by the life and the sum total of the dollar years divided by the reproduction new value, by the total of the reproduction new value column—no, divided by the total expenditures in 75 years. Then to determine the dollar years you multiply the nex- to the last column by the life and the sum total of the dollar years divided by the reproduction new value, by the total of the reproduction new value column—no, divided by the total expenditures in seventy five years gives the true composite life of 58.1 years. Now referring back to the table on page 64, the same method of calculation is used and the reason that I am taking the times renewed in 58.1 years is because that happens to be
1334 the figure of the longest lived apparatus contemplated in this table.

Q. How did you treat paving over mains as compared with the paving itself in this?

A. I estimated the life of the paving over mains the same as the mains themselves.

Q. And why?

A. For the reason that when the mains finally had to be replaced the paving has to be replaced at the same time and the cost of that work comes at the same time that the cost of the pipe itself takes place.

Q. Getting down to where there is a substantial difference, say at house services, is there anything there to show the way in which you have computed your figures as to this item?

A. I have assumed house services to have the same age as meters. The determination of the composite age of meters is shown in the table on page 71. That table gives the calculation by which the composite age of meters is derived at reproduction new value. The only difference between meters and services being in the life. I have assumed the composite age of the services as the same as the composite age of the meter, but the life of the services I have assumed at twenty years whereas I have assumed the life of meters at twenty five years.

Q. Before I forget it, where did you obtain the data set out on page 71?

A. I was furnished with a list of the number of meters installed during each year beginning with 1887 and was also given a memorandum of the number of meters which were in use at that time. By means of this column which I have in ink notation in my book, but did not copy into the other reports, because I did not think it was necessary, I obtained the first column in that table called
1335 investments. The total of that column you will notice meaning now the column headed investment is $255,885. If you will not refer for a moment to page 121 you will find at the bottom of page 121 the last column gives the total cost of meters in use on the basis of reproduction now with a detai- of the additional

cost items and that total figure, $255,885 is the same total figure as shown *b*at the bottom of column headed investment on page 71. Now taking number of meters installed each year and using the average price per meter as derived from the total figure of $255,885 I compute that column headed investment. Now the second column, years in service I believe is self explanatory, it is just the number of years these meters have been in service and the third column is the product of column one and column two, calling column one the Investment column. Then the total of the investment years divided over the total $255,885 equals 8.23 which is my estimate of the average of the meters. I have also shown on the page the estimate of the average of the meters installed before 1886 and the ratio shown, 23 is to 6.8 as 22 is to X, that gives the figure of 6.5 years. In other words my estimate of the average of meters installed before 1886 in 1886 is 6.5 years and that continued to 1911 January 1, is 29.5 years as shown.

Q. You have a computation on page 67 which is headed determination of the average age of mains on the investment basis.

A. Yes, sir.

Q. Did you use that or if not for what purpose is it inserted.

A. That table is inserted to show my method of calculating the average of mains, and that was done using basis figures only. The investment in each year is detailed on page 68. The 1336 column on page 67 headed investment is derived from the last column on page 68 headed total. That total on page 68 shows the dollar value of mains laid each year. The dollar value of mains laid each year in turn is derived from the table on page 69 which shows feet of each size of main laid each year. Now go back to the table on page 67, the multiplication by the investment of the years in service *ives* the investment years as shown in the last column and the sum total of the investment years divided by the sum of the investment, in other words by $930,746, gives the average age of mains at 8.9 years.

Q. Turning to page 68 does this page show the amount of mains in the ground each year commencing with age 1864 to 1888 and then running down to and including 1910, all the mains laid each year?

A. The table on page 68 is the dollar value. The table on page 69 gives the number of feet.

Q. I will take the 69 table first. Does the table on page 69 show in feet the amount of mains of each size laid from 1864 to 1888 and then in 1888 and each year thereafter down to and including 1910?

A. It does.

Q. Where did you get that information?

A. That information was given to me on a memorandum handed to me by the company.

Q. So that you relied on the company for this information?

A. I did.

Q. And then page 68 is this reduced to dollars?

—. Yes, sir.

1337 Q. Now on page 70 you have what?

A. On page 70 I have a table showing a determination of the average age of river pipes on the investment basis using *preproduction* new value. This is computed in a similar manner.

Q. Page 65 shows the results of those computations as to each of the various parts of the distribution system.

A. Yes, sir.

Q. And your age dollars, that means the dollars multiplied by the age?

A. Yes, sir.

Q. You take that for what purpose?

A. I use that computation for the purpose of determining the composite age of the entire distribution system.

Q. Which you find to be what?

A. Which I find to be 8.6 years.

Q. What application do you make of that?

A. I used that figure to determine the present value of the distribution system.

COURT: 58.1 is 58.1 per cent of the cost of the mains, the value.

A. Page 66 that figure*d* 58.1 is the composite life or as you might call it the true average life of the street mains, or all of the street mains. And I determined that on the investment basis as we call it.

Q. What use did you make of this in obtaining the present value?

A. The figure of the composite age?

Q. Yes, 8.6 years.

A. If you will refer to page 63 you will find the top item is called street mains and the reproduction new value of this
1338 item is $930,746. Now down on the lower portion of the page you will find the formula that I used to determine the condition per cent and in that formula, or rather before you can apply that formula it is necessary to know the age in years, the life in years and the rate of interest assumed in this compound interest calculation. In that case the street mains the age is the composite age as determined on page 66 viz.: 58.1 years, I should say the composite life and the composite age of the street mains is 8.9 years. Now applying these two figures in that formula together with the rate of interest 4 per cent gives the condition per cent of street mains namely, 95.2 per cent. Now multiply the reproduction new value by the condition per cent gives the present or depreciated value of street mains at $886,017, as shown on the top line of page 63.

Q. In the same way, using the same theory you worked this out for meters house services and the other items going to make up distribution system?

A. I did yes.

Q. What is your estimate of the present or depreciated value of the distribution system and is this estimate in your judgment fair and correct?

A. The present or depreciated value of the distribution system in my judgment is $1,746,924, as shown on page 63 and in my judgment this is a fair and correct value.

Q. That is the condition per cent as carried over to page 17 is it not in your summary there?

A. Yes, that is shown on the summary and in the table on page 17.

Q. Now I want to as briefly as I can explain some matters in your report here. Commencing at page 28 what do you give?

1339 A. On page 28 is given the estimated expenditures in building up this property during the year 1911 not including taxes and interest.

Q. That includes also page 29?

A. Yes, sir.

Q. Now beginning at page 30, at 30 and 31, what do they show?

A. The tables on pages 30 and 31 show the estimated expenditures on the basis of reproduction new at the gas plant during the years 1912 and '13, using base figures only. It is estimated there is no work done at the gas plant during the year 1911.

Q. Now taking this generally from page 25 on to page 42 do these pages contain the details which are set out in the summary on page 24?

A. Yes, sir; they do.

Q. Or putting this in another way the pages following 24, up to and including 42 are all summarized on page 24?

A. Yes, sir.

Q. Now Mr. Baehr referring to page 43, I see there you have the number of feet of each size of street mains by districts, and pages 44, 45, 46, 47, 48, 49 and 50 all relate to paving or matters pertaining to paving?

A. Also to the distribution system.

Q. I mean the mains or matters pertaining to mains?

A. They also include, also on page 50 is shown the details of services and the preceding tables you mention refer to mains.

Q. Then referring to page 51 there is some details as to meters?

A. Yes, sir.

Q. Now state whether or not this is the same data which you used in the preparation of the report?

A. This is the data upon which the report is based with

1340 reference to the expenditures by districts.

Q. Now what is page 52?

A. Page 52 is a general summary showing a determination of the composite life of the entire equipment on a reproduction new basis.

Q. You said the entire equipment. In what sense do you use the word equipment?

A. In that instance in the sense of including the entire physical property except real estate.

Q. And what is page 53?

A. Page 53 is a summary of the same items as shown on page 52 only page 53 results in a determination of the composite age.

Q. The following pages 54 to 62 inclusive cover what?

A. They cover the determination of composite life and age of buildings, apparatus and physical equipment except the distribution system.

Q. And what method, or have you used the same method here you have already described in dererming this composite age?

A. I have.

Q. Now Mr. Baehr did you compute the going value of this plant?

A. Yes, sir.

Q. Turning back now to page 12, How do you define going value?

A. I define the going value as the enchancement in value of the physical property of any concern due to the business that concern has and is doing. This going value has sometimes been called the value of the created income.

Q. You refer here to certain items which have been included in going value by engineers. Please explain what they are, and why in a general way?

1341 A. I have enumerated a certain number of items on page 12, such as advertising, solicitation of business, gratuitous work, demonstrating old and new devices for utilizing gas, educating the public to the advantage of gas and gas plant products, experimental work, trying installations of gas consuming devices, money and efforts spent on prospective business that does not develop, loss of interest because of extensions into what is at first unprofitable territory, but where such extensions are made perhaps on account of the paving and perhaps for their advertising value, cost of the development of the organization in the effective handling of business development. Excess of operating expenses above income during a portion of the development period. Deficit in fair return on the investment during the development period. Now these items which I have just enumerated and which are shown on page 1*w* are stated to be various items which have been held as being included in going value by different engineers at different times. Again other engineers include other items as shown at the top of page 13. Such as management which is explained on that page and which may be stated briefly, that it is imperative that high managerial ability and efficiency should be recognized and allowance for same made for the reason that such a policy would eventually result to the interest of the consumer. Other engineers have also held that *g*he possession of real estate of sufficient area and so located as to be readily available for extensions is an asset of value. Other engineers have held that another feature or item of going value is based on the fact that where connections are made to the consumers' hou-es and business relations established it requires some special incentive to in-

1342 duce such consumer to change to the competing company.

Q. You refer here to several method- of figuring going value. Will you state — your views in the gas industry are?

A. In arriving at my judgment of what the going value of this property is speaking as of January 1, 1911, I have considered several methods. In the first place some enginee-s have held that the annual revenue derived from the sale of gas is a fair measure for going value. The idea that such engineers probably had in their ming*s* was that the least possible development, — period to reproduce the business of any company referring now to any gas company is two years. Such engineer apparently assumed that a

straight line development of the business would take place during such two years and they probably reasoned that the purchaser would assume that he would lose one half of two years' revenue. In other words one year's annual income from the sale of gas. Applying this method to the case of the Des Moines Gas Company as of the date of this valuation would result in a figure of about $540,000. Still other engineers have estimated going value on another basis, namely on the basis of $30.00 per consumer. There idea of estimating $30 per consumer is that it is the average cost per consumer to equip him with gas consuming appliances and secure his business and this has reference to developing business in a reasonable length of time. In a way this fifure results almost the same as the figure based on annual revenue and in the case of the Des Moines Company as of the date of this valuation the figure of $30 per consumer results in an estimate of going value of $597,090.

Q. What method of figuring going value commends itself to your judgment as the most accurate?

1343 A. In my judgment the method which lends itself to the most accurate computation and upon which I prefer to base my judgment of the going value of this company is to measure the going value by the loss incurred during the period of development. In the instance of the Des Moines Company I am measuring this loss by the loss incurred by the Des Moines Company in developing its business to its stage and to the revenue as of January 1, 1911. T-is method of estimating going value is based on the idea of reproducing the entire physical equipment and the business of the Des Moines Company in a given lengt- of time. In order for the method to be such that I would p-ace reliance on it it is necessary that each step of the calculation be such that an experienced gas engineer would see that each step and the amount of time consumed by each protion of the construction and development would be reasonable and wou-d be such that would be readily possible to carry out. The method appeals to me for the reason that I can exe-cise my judgment on each step of the process of reproducing this company, on each step of the process of reproducing its physical equipment, and can also reproduce its business logically and in the period of time which appeals to me as being reasonable.

Q. Now turn to page 138 of your report, does that page and the remaining pages of your report there contain information which you have used in reaching your conclusions as to going value or computations growing out of this information.

A. These pages you have stated namely from page 138 through the balance of the report with the exception of pages 148, and 149, contain computations upon which I base my judgment as to the going value of the Des Moines company, meaning the Des

1344 Moines Gas Company as of the date of this valuation. Pages 148 and 149 you will notice refer to future depreciation.

Q. Do you use this future depreciation in your going value computations?

A. I do not use the future depreciation as figures on pages 148 and 149 because those two pages are merely studies or calculations

of future depreciation and the amount of future depreciation which in my judgment is fair and reasonable is not shown there on pages 148 and 149 but is indicated in the following calculations.

Q. Before we leave these pages, so that -e may leave them, let us take page 148 for a moment. You have there compiled or produced the operation and distribution system, its reproduction value, composite life and then a column headed straight line basis. What does that mean?

A. The straight line basis column represents an amount of money which in my judgment is necessary to set aside each year for depreciation, is estimated on a straight line basis.

Q. What do you mean by straight line basis?

A. That simply means the total reproduction value divided by the composite life of any piece of property or equipment that you are attempting to determine the d-preciation of.

Q. If I had a single piece of equi*o*ment with a life of 50 years and cost $100 that would be one fiftieth each year.

A. That *o*wou*n*d be one fiftieth each year on a straight line basis.

Q. The next column is headed 4 per cent sinking fund basis. That is what?

A. That c-lumn repre-ents the amount of money which would be necessar*t* — aside each year to take care of the total depreciation of any item provided that amount of money so -et aside is in-
1345 vested at four per cent interest and compounded.

Q. What do you mean by the column va*i*red rate of interest?

A. That is a study of the amount of money which would be necessary to set aside each year on a compound interest theory and using different rates of interest as shown on page 149. These different rates of interest are proportioned or assumed according to the life of the item under consideration, a longer lived item acquiring a smaller rate of compound interest than a shorter lived item.

Q. And as the resul*f* of this study what did you adopt as the basis for your fu*r*ture depreciation?

A. If you will refer to page 148 the total amount of money to set aside every year on a straight line basis you will notice is estimated at $76,352. This am*i*unt is tax 2.88 per cent of the total reproduction value. The next column the 4 per cent sinking fund basis totals $33,359 which is the amount of money I have estimated necessary to set aside annually to take care of depreciation if invested at four per cent and this is 1.26 per cent of the total reproduction value. The final column estimated with varied rates of interest totals $38,-733 and this amount again is 1.46 per cent of the reproduction value. Now informing my judgment of the proper amount of money to set aside each year to take care of depreciation, I could not conceive of any company setting aside any amount of money each year without investing it som- way. Some companies invest such mon*e*is in extensions in their own plant. Other companies that I have known have invested such moneys in their own bonds which in a measure is in their own extensions. But, as a matter of fact, it

appears fair to me to consider that no company would set
1346 aside any considerable amount of money without investing it some way or other. On this basis it does not appear fair to me to consider depreciation on a straight line basis. Now on the other hand I cannot conceive of the compound sinking fund basis being entirely safe to adopt without taking into consideration some other things. For instance the lives of these various items entering into the property of the Des Moines Gas Company from my best estimates based on my experience of the probable life of that kind of property. On the other hand I am not able and I do not think it is humanly possible to foresee changes that may take place in the art of gas manufacture or distribution. Neither can I foresee and estimate the fact that more efficient apparatus might be invented which would make it advisable to take out the present apparatus rendered so *absolute* and substitute the more efficient modern apparatus.

COURT: Would it pay to do that?

A. It would not pay to do that unless *it* resulted in a saving of money.

COURT: You would consider the co-t of the old apparatus.

A. Consi-er the cost of the old apparatus, yes. Now there is another feature in relation to properties of this kind which is very important and on which subject our knowledge is altogether insufficient. We are perhaps on the threshold of a great destruction of mains by electrolysis that may have great consideration in reference to approximate cost. From present knowledge we make this estimate and I make the best estimate I am able to from proper consideration of the probable life of these mains, but I am not able to say what might happen to them from that standpoint. Considering
the subject of meters the tendency of the gas business has
1347 been in recent years towards the use of a higher pressure. Gas very recently is beginning to be consumed right up to the burner at greater pressure than we formerly considered at all. For instance gas is used — distributed at pressures which I think I can best bring to your mind by stating that the pressure is somewhere in the neighborhood of one or two ounces per square inch. Now there are lights, gas lights, gas lamps on the market which are using gas up to three pounds pressure per square inch at the burner. That is something like tw-nty four or five times as much pressure as was formerly used. Now I am not *sending* that this is universal but I am saying that this type of burners are being invented and it is found that as the pressure increases at the burner, especially with the type of burner known as a Bunson burner using a Welsbach mantle that the light efficiency per cubic feet of gas used is much greater than under low pressure. It seems when this subject was first developed that the pressure was gradually raised step by step and as this pressure was raised it was found that there was constant increase in the light efficiency. Now as far as we know today we have not reached the limit of this light efficiency and we have not reached the limit of efficiency of gas consuming appliances for that purpose. Now in the same way gas consuming appliances using gas

for fuel purposes it is found that as the pressure under which this gas is burned is increased there is an increase in efficiency. That simply means as applied to the subject I have in mind now, the question of tin meters that there may come a time when the tin meter as now used will no longer be safe because they do not stand very high pressure. It may be that some day that it will be found necessary and reasonable to discard tin meters entirely. That is
1348 another of the considerations which governs the mind in placing an estimate on furture depreciation. Now there may be other features which govern the furture depreciation and which have an influence on my judgment. There may be at some time in the near future or within the life as I have figured it extraordinary demands on street work due to the growth of the city and the increase in civic pride we might say. For instance you take in New York or Brooklyn or Chicago, particularly in New York and Brooklyn at present subways are being built and going to be built and there are going to be more subways than there have been before apparently. Whenever these things take place it requires changes in distribution and in mains and we cannot foresee exactly what depreciation may be caused by these reasons. In considering this subject therefore my best judgment is that it is not safe to base depreciation on the straight line basis, neither is it entirely safe to base it on the ordinary compound sinking fund calculation. But my best judgment is that the depreciation of the Des Moines company and that a fair figure to use for that would be two per cent of the reproduction new value of the property which as indicated on -he table on page 148 totals $2,642,467. Two per cent gives a sum somewhat in excess of $52,000 Now in order to reduce this depreciation allowance rather the sum of money which it is necessary to set aside each year for depreciation to a figure which is convenient to handl*y* a figure which will grow as the investment in the business grows, my judgment is to use instead of the two per cent a figure of ten cents per thousand feet of gas sold. Using for the year 1910 ten cents per thousand feet of gas sold results in a figure of $52,510 which is 1.99 of one per cent of the reproduction
1349 value or corresponds very closely to my original judgment of two per cent and is a trifle less. Therefore my judgment is that a fair amount of money to set aside for depreciation of this company will be obtained by using the figure or ten cents per thousand for the gas sold per year.

COURT: Would not that vary?

A. That would vary yes. As the amount of gas sold increased it would increase. The basis of that assumption is that the amount of money invested in this property will increase from year to year and the amount of actual property therefore will increase from year to year and for that reason I deem it advisable to use the figure which is used and it corresponds in my judgment to the true percentage of the reproduction value which should be used.

Q. I think Mr. Baehr you called my attention to something in this Kings County case which confirms this estimate you have made or -tended to. Will you tell the Master what it was?

A. I was recently employed by the Kings County Light Company of Brooklyn, New York, in a rate case which was presented before the public Service Commission for the first district of New York, and I found that the figures which I worked out in that case, that is in the case of the Kings County Lighting Company was practically the same figure which the engineers of the Public Service Commission in the first district had worked out. In fact our figures differed by something less than $1,000, there estimates as I recall it being about $64,000 and my estimate as I recall it being about $63,000 and I arrived at that on the same basis of figuring and reasoning that I use in this instance.

Q. Who are the engineers for the commission, do you know?

1350 Mr. Byers: If that is extending very far I want an objection to it as entirely incompetent and immaterial what somebody else did or how it compared with his work.

A. I don't know them by name sir.

Q. I mean what relation do they sustain to the commission, what do they do for them?

A. As I understand it they are the engineers employed by the Public Service Commission of the First district in New York for the purpose of carrying on this kind of work for the commission.

Defendant moves to strike this evidence not because it is so very important in this case, but because it is irrelevant and we do not care to go into that field from our side of the case to either dispute it or support it.

Q. Turning to page 138 which is the beginning of this data which you used in figuring your going value, that shows what?

A. That table on page 138 gives the past gas sales of the Des Moines Gas Company in cubic feet, rather in thousands of cubic feet beginning with the year 1900 up to and including the year 1910. And thereafter gives my estimate of the future gas sales of the Des Moines Gas Company for the years 1911 to 1917 inclusive. That table also shows in the last column the estimate reduced to a percentage increase in total over the previous year.

Q. Why did you run this estimate up to and including 1917?

A. Because in making the figures for the going value calculation I estimate that the comparative plant will catch up to the going plant at the close of the year 1917.

Court: What you term the hypothetical plant?

A. Yes, sir.

Q. These figures down to and including the figures for the
1351 year 1910 were obtained by you in what manner?

A. These figures were given to me in a memorandum by the company and I assumed those figures to be correct.

Q. How did you get the figures after 1910?

A. The figures from 1911 to 1917 inclusive, are my estimate of the future gas sales of the Des Moines Gas Co.

Q. You know that Mr. Lea has testified in this matter. Do you know whether these estimates agree with his or not?

A. I don't know whether they agree with Mr. Lea's figures or not. These are my own figures and I paid no attention to anybody's else.

Q. You don't know then whether they agree or do not agree?

A. I do not.

Q. The word parallel is down here, what does that mean?

A. That means beginning January 1, 1918, the going plant and the comparative plant run parallel. That simply means I felt it was not necessary to carry the estimate beyond January 1, or rather beyond December 31, 1917.

Q. On the next page you have something headed method of calculation of gas consumed by districts of the comparative plant. What occasion was there for making any computations of this kind?

A. You will have noticed in some earlier tables in this report that a careful estimate was made of the reasonable rate at which the physical property could be duplicated or reproduced and in the distribution system in order to get at that reasonable rate and as before explained we divided the city into three districts, having determined the rate at which we could reproduce the mains and services and meters in these districts, it next became necessary to determine the rate at which the comparative plant would secure business.

1352 In order to determine this we secured data—I say we now, meaning myself—I secured data on the consumption of meters in the third district in 1910 said data being furnished to me by the gas company. Now the result of the gas company's determination as to the consumption per meter in the three districts and also dividing this consumption between that of the regular meters and that of the prepayment meters is shown in that table. In the lower half of the page 139 I have calculated a percentage which is used throughout the development period applying that consumption per meter as determined in the tables furnished to me by the gas company. For instance in District No. 1 as shown in the lower table there were in use at the time of this valuation 4,986 regular meters and 4,515 prepayment meters. Multiplying the number of regular meters in District No. 1 by the consumption per meter in District No. 1 as indicated above on the same page results in an estimated sale in District No. 1 in 1910 of 194,878,000 cubic feet for regular meters.

Q. That is where?

A. That is just below the middle of the page under the heading of District No. 1.

Q. What is there is 194,878?

A. Well that table is expressed in thousands of cubic feet. And the same figure for the prepayment meters in District No. 1 is 87,473 which amount means thousands of cubic feet. Making a total in District No. 1 of 282,351.

Q. To be sure we have got that straight that is 282,351 thousands?

A. That really means 282,351 thousand cubic feet.

Q. You have expressed it here in thousands?

A. I have expressed it there in thousands of cubic feet

1353 omitting the last three ciphers in each instance. In the same way I have calculated the consumption of District No. 2 and

found that a total of 145,227 and in the same way District No. 3 and found that a total of 88,846. The total of the three districts calculated in this way is 516,424. This figure differs from the actual sales of the Des Moines Gas Company in the year 1910 somewhat, therefore in order to get the percentage of consumption of each district to the total I have divided the estimated consumption for instance in District No. 1 by the total estimated consumption and the same in District No. — and the same in District No. 3 and that results in the following percentages. District No. 1 sells or uses 54.8 per cent of the entire gas sold in Des Moines, District No. — 28.1 per cent and District No. 3, 17.1 per cent and in determining the sales of gas in each district in the comparative plant I use these percentages as applied to the sales of the going plant for the same year.

Q. Now turn to page 140. In computing your estimate of the operating expenses and the income of the hypothetical plant or comparative plant, was it necessary for you to have the amount of gas which it would manufacture and sell?

A. It was.

Q. What was the purpose of this computation that is set out on page 140?

A. The computation on page 140 gives the estimated sales both of the going plant and of the comparative plant by districts for each year during the development period, that is from the time gas was first turned on or would be first turned on January 1, 1913 up to and including the year 1917.

Q. And that is shown by districts and also by aggregates
1354 for each year?

A. Yes, sir.

Q. The per cent consumption comparative plant is per cent of what?

A. That percentage is derived from the following two pages, pages 141 and 142. These pages——

Q. You didn't catch my question. That is the per cent of what?

A. That per cent applied to the consumption of the going plant gives the consumption of the comparative plant.

Q. Now then turn to these succeeding pages, 141 and 142 and state how you reached that conclusion which you show on page 140 as to this percentage?

A. The table on page 141 is my estimate of the physical rate of installing meters of the comparative plant. I can illustrate this best by taking as an example District No. 1. It is estimated that all mains and services in District No. 1 would be laid in the year 1912. Now the question that next arises is the question of the rate of installation of meters. My judgment is that there would be no meters installed on January 1 which naturally follows the assumption that the mains and services would be laid in that district in that year. My judgment is that business would be acquired at the rate of 60 per cent of the number of meters actually in use in District No. 1 of the going plant would be in use by the comparative plant at the end of the year 1912 and that the average number of meters in use in this particular district in 1912 would be 15 per cent of the meters

in use in that dis*yti* of the going plant. In the year 1913 therefore we would start with 60 per cent of the meters in use and I have estimated that business can be acquired in this district at such a rate that at the end of the year 1913 100 per cent of the meters
1355 would be in use and the average for that use would be 80 per cent. The same method holds through the other districts.

Q. Now turn to the next page?

A. Page 142 gives the estimated rate of the actual acquiring of business as expressed in consumption of gas of the hypothetical plant at the different periods of each year in which this is compared to that of the going plant. I can illustrate this by taking Di-trict No. 1. It was estimated that gas is turned on January 1st, 1913. From the preceding table on page 141 you will notice that the estimated number of meters in use on January 1, 1913 is 60 per cent of the total. My judgment, however is that you could not immediately acquire the full consumption of gas in that district. That is you could no*g* immediately acquire the full consumption of gas for each meter installed. My judgment is that there would be enough business or gas consumed so that 25 per cent of the consumption of the meters installed on January 1, 1913 would be consumed at once. By the end of the year 1913 that 75 per cent of the consumption of the meters installed would be secured. Now it is well to bear in mind that both these tables are expressed in per cent gas and not in actual cubic feet so that when these tables are used it is necessary to multiply these percentages together. Now my estimate of the average consumption of gas for the year 1913 of the meters installed during that year or rather of the average actual number of meters installed that year is 45 per cent and as you follow down through that table you will notice that the business acquired gradually increases until the consumption of gas reaches 100 per
1356 cent. For District No. 1 it is estimated that the business in this district is secured to equal that of the going plant by the end of the year 1916, although all the meters are installed at the end of the year 1913. In the same way for District No. 2 it is estimated that here the business would be secured by the end of the year 1916 to equal 100 per cent, but all the meters would be installed by the end of the year 1914. And the other district is shown in the table.

Q. Turning to page 143 you take up what there?

A. That is merely data giving the record of send out in cubic feet of the maximum day, the maximum week and the send out for the year of the Des Moines Gas Co. for the years 1904 to 1910 inclusive.

Q. You obtained this information where?

A. This information was given to me by the gas company.

Q. Turning to page 144 what appears there and where did you get this information?

A. This information was given to me by the gas company and is a statement of the unaccounted for gas of the Des Moines Gas Co., expressed both in cubic feet and in per cent of gas sent out for each of the years 1904 to 1910 inclusive.

Q. That includes the gas sent out that is not registered by consumers' meters and accounted for that way.

A. The unaccounted for gas is the difference between the gas as sent out from the station and the gas as registered by the consumers' meters or otherwise actually accounted for.

Q. Now then digressing for a moment these percentages the last three years are four, four and a fraction and five and a fraction. Now are these high or low?

A. That per centage of unaccounted for gas is very low and shows that the condition is good in -hat respect. For instance I
1357 made some computations of the unaccounted for gas in various places and have also made some computations of the unaccounted for gas in Des Moines reduced to per mile of main on a 3 inch basis. That is reduced all mains to i-s equivalent number of feet of three inch main. In Des Moines the unaccounted for gas per mile of actual main last year was 129,000 cubic feet and reduced to the equivalent three inch basis it was 71,600 cubic feet. Now comparing with some other cities I have got for instance Brockton, Massachusetts, 177,650, Cambridge, Mass., 96,067, Fall River*m* 168,-085, Lawrence 124,354, Lynn, 153,327, Worcester, 185,532, Newton, 42,661, Springfield, 47,326. These statistics from Massachusetts cities were derived from the rep-rt of the Massachusetts commission, that is the last report issued for 1910, and in this case I believe gives data up to July 1, 1910. You will notice that in most instances the unaccounted for gas of these cities per mile of equivalent three inch main is considerably over 100,000 feet per year and only three of them are below 100,000, one of these being Cambridge with 96,000, Newton 42,000, and Springfield 47,000, in round numbers, whereas Des Moines last year was 71,600 feet. This method gives a very accurate way of comparing the accounted for gas of various cities and shows that the unaccounted for gas in Des Moines is very low. I have also reduced the unaccounted for gas in these Massachusetts cities to per cent of gas sent out as follows: For the year 1910, except the Massachusetts which I believe end July 1, 1910. Des Moines in percentage showed 4.31; Brockton, 10.97; Cambridge, 4.15; Fall River, 6.91; Lawrence, 7.03; Lynn, 6.35; Newton, 3.54; Springfield, 2.66; Worcester, 7.32. These compari-
sons lead me to say that the unaccounted for gas in Des
1358 Moines is low, is very low.

Q. Now the next page here in Exhibit 21 is revenue per thousand in Des Moines only which I think explains itself except the note there. What does that mean?

A. In looking over the operating income and expenses of the Des Moines Company for the year 1910 and one or two years previous I find that the company has a small income from Miscellaneous sales.

Q. Of what?

A. Which are sales of other things besides gas and in order to reproduce the condition as nearly as possible I have taken account of that.

Q. That you have reduced to the amount per thousand feet?

A. I say as to the estimate of income of both the going and the comparative plant during the business development period.

Q. That amount is .0005 per thousand feet?

A. That should be $1.0058.

Q. What should be 1.0058?

A. The figure you have just read. The figure I have read includes miscellaneous sales of .0005 dollars per thousand feet.

Q. So in order to get the revenue per thousand feet of gas sold should this be added or subtracted from the revenue $1.0058 on the same page?

A. It is included in that revenue as shown because it is included in the total revenue.

Q. Now what are these figures that are contained on pages 146, 146½ and 147? What do they relate to?

A. These figures are to show the calculations I have made to obtain the estimated future taxes of both the going plant and the comparative plant.

1359 Q. I see that the table on page 147 is headed estimate of future taxes for going value calculation?

A. The particular table on page- 146 and 146½ represents the calculation of the taxes for the going plant and the table on page 147 represents the calculation of the taxes for the comparative plant.

Q. With these figures as a basis what attention if any did you give to estimating the operating expenses of the going plant?

A. I made a very careful study of the probable operating expenses of the going plant for the years 1911 to 1917 inclusive as shown in the first large table following page 149. This study was based upon the actual operating results of the Des Moines Gas Co. for the year 1910 to which I made certain adjustments for instance deducting estimated cost of supplying gas to Valley Junction, and I also adjusted certain other items so that the cost as I estimated it would represent in my judgment a fair average cost of operation for the years under consideration.

Q. You have another large sheet following this headed estimated operating expenses of the comparative plant during period including details and results of going plant 1910, with estimated Valley Junction cost deducted. What is this table?

A. This table is my estimate based on a study of the operating expenses of the company of what the comparative plant would require for operating expenses beginning with the year 1911 up to and including the year 1917. I might say that the column shown under going plant 1910 adjusting certain items and deducting cost of supplying Valley Junction is the same as the corresponding column on sheet headed operating expenses of going plant.

1360 Q. Take the year 1913 under operating expenditures opposite the word manufacturing, you have 3600 before your column showing cost per thousand. What does that mean?

A. That means that my estimate of the number of dollars required for that particular item manufacturing in the year 1913 of the comparative plant is $3,600. Comparing that to the going plant you will find that in the going plant my estimate of the amount of that particular item for that year 1913 is $4,400. Now I do not say that the comparative plant will require that *must* expenditure in

that item. My estimate is $3,600 for the comparative plant and the net returns——

M. BYERS: What are you referring to?

A. The comparative plant estimated operating expenses the year 1913 as itemized the amount under per M made. Now this $3,600 I reduced to per M made. In order to get this reduced to the cost per thousand feet made it was necessary for me to estimate not only the sales of the comparative plant for that year but also the unaccounted for gas. Now the unaccounted for gas of the Des Moines company is very low and in my estimate of the operating expenses of the going plant I have assumed that the company would be unable to maintain the unaccounted for gas as low as it had in the year 1910 and that the unaccounted for would increase in 1911 to 4.5 per cent, in 1912 to 4.6 per cent until it reached five per cent in the years 1916 and '17. Now in the comparative plant the tendency of the unaccounted for gas would be the other way. It would start higher and would become less as the amounted business increased and I have shown my estimate of the unaccounted for gas of the comparative plant on the sheet for the comparative plant.

1361 Q. In each instance then where you have figures preceding an item in the column per M made, these figures represent the expense in dollars for that year for that particular item as you estimate it, is that right?

A. They do not. The figure 3600 represents dollars, but——

Q. I guess I did not make myself clear. Where you have figures as I refer to them as 3600, 2500, 3000 without any per cent or anything else accompanying them, do they represent the expense in dollars for that particular item.

A. They do.

Q. The next class is illustrated by the second item boiler fuel opposite which you have under column per M made, as 43 and to the left of that 10 pound X. Wha- does that mean?

A. The boiler fuel of the Des Moines company for 1910 ran a certain number of pounds of coal used per thousand feet of gas made. Now I have estimated when the comparative plant starts up that the boilers would have to be run and that the amount of coal while in total not as great as that of the going plant, yet owing to the much smaller amount of gas made would be greater per thousand feet of gas made and have made my figures and my judgment is based on my experience in other plants that it will require for the amount of gas made there in this kind of a plant 10 pounds of extra boiler fuel per thousand feet of gas made in the year 1913.

Q. So that 10 pounds X is in effect an expenditure in the fuel figured there upon .0413?

A. Yes, sir; from that the figure per thousand of .0413 can be deduced.

Q. I notice in the next year this same item you have five pound X?

1362 A. Yes, sir.

Q. That means as the consumption or product is increased that excess is decreased?

A. That means that owing to the much greater amount of gas

made the quantity, the extra quantity of coal per thousand feet decreases very materially and subsequently disappears.

Q. In the succeeding three years there is no excess shown there?

A. There is not.

Q. Your next item here is under generator fuel I think 8.5 pounds excess what does that mean?

A. That means that my judgment of the amount of generator fuel per thousand feet of gas made in 1913 of the comparative plant will be 8.5 pounds more than the actual going Des Moines Co. used in 1910 per thousand.

Q. What is the difference between boiler fuel and generator fuel?

A. The difference is that the fuel that is used in steam boilers is called boiler fuel and that is used for making steam. The fuel called generator fuel is the coke which is used in the water gas generator for making water gas.

COURT: That is what is used for making gas?

A. Yes, sir.

COURT: Is that used altogether here?

A. Yes, sir.

Q. What, don't they use local coal here for generator fuel?

Objected to as incompetent, immaterial and the witness is incompetent.

A. Local coal cannot be used in water gas generators, it will not serve the purpose of generator fuel which has to be a hard carbonaceous fuel.

Q. Opposite manufacturing labor you have 20 per cent X.
1363 That is explained the same way as these other items?

A. Yes.

Q. Under oil you have .5 gallons X?

A. Yes, sir.

Q. That is explained the same way?

A. This means my estimate of the consumption of oil per thousand feet of gas made of the comparative plant in 1913 will be .5 gallons more for each thousand feet of gas made than the going plant used last year.

Q. I notice there is an item here at the end of your manufacturing just before your net manufacturing expense, less residuals that is in red. Why is that put in that way?

A. That is deducted from the manufacturing expense because it represents the amount of money estimated to be realized from the residuals in this case tar.

Q. That is the process of manufacture produces some tar.

A. Yes, sir.

Q. And you deduct what is realized from that from the cost of manufacture?

A. Yes, sir.

Q. Now then I have just referred to this deduction on account of the amount realized from the sale of the residual here, tar. Is this a customary way of figuring these expenses making that deduction and in that way?

A. It is. In this kind of a plant they have a bi-product which

has value. I take cognizance of that in the estimated cost of manufacture.

Q. Turning to the next large sheet will you please explain now just how you have attempted to compute the cost of reproducing this business by the use of the factors we have been consider-
1364 ing?

A. In general I base my judgment of the going value on the difference in net earnings reduced to their present worth of the going plant and the comparative plant during the period of development of the business. In the first place the first calculation shown in the upper right hand corner of this sheet is the investment reduced to its present value and reduced to the expenditures in each year, omitting now the first column in reference to working capital or going value. The second colum- shows my estimate of the amount of working capital to allow during each year totaling $150,000. The third column is blank. The fourth column gives the total of the investments. The reason that the third column is blank is that this is the first trial calculation in which no allowance whatever is made for the amount of going value in the investment calculation. Now the second calculation following at the upper right hand of the page under construction gives the calculation of the interest which enters as a revenue of the comparative plant. This is deduced in the manner shown, namely, column No. 1 of the interest calculation shows the total investment to date in the comparative plant. That amount which I have deducted—take for instance the first year the investment is estimated to be $270,758.

Q. May I interrupt you a minute. I want to tie some of these things together. We have already referred to some parts of your report which show the investment in detail each year. Without finding it now do you remember the parts of the report referred to?

A. Yes, sir.

Q. Now how do the amounts shown there check with these
1365 amounts given *given* here?

A. They will not because these amounts are amounts reduced to present value. The amounts shown in the report are amounts on the basis of the reproduction new.

Q. But they are based on these figures that are goven here?

A. They are, yes.

Q. Now will you proceed please?

A. Going back to the interest calculation the amount $2,440,613 at the top of column No. 2, is the difference between the total estimated investment as shown under the investment calculation less the amount invested for that year as shown in column No. 1. Now column No. 5 shows the amount invested for construction during the year or the amount used for construction during the year and is the same as the last column of the investment calculation. To determine the amount of interest that this money would accrue it is estimated that the amount of money which is used for construction during the year is invested at 2 per cent on daily balances and the interest on it is therefore figured at one half of two per cent on the assumption that the construction proceeds on a straight line during

the year. The amount of money which is left from the total and which is estimated as not being used during the year is figured to be invested at the net income rate of two per cent for the entire year and the calculation of that is shown in column No. 4. The sum of the interest in column No. 4 and No. 5 gives the total interest estimated to be earned by this money during each year and this total interest is carried down into the comparative plant under the column interest on unemployee capital.

Q. That would appear opposite 1911?

1366 A. The amount as calculated in 1911 under first preliminary calculation is $51,520, that is the amount that appears opposite 1911 in the comparative plant under the heading interest on unemployed capital.

Q. Has interest been computed in the same way for each of the succeeding years?

A. It has.

Q. Now coming dow- to your comparison take 1911 with the going plant and tell us what you show there?

A. Referring to the calculation going plant in 1911 the second column which is headed M cubic feet of gas sold is my estimate of the amount of gas that will be sold in Des Moines during the year 1911. The next column shows the increase over the previous year in per cent and these figures correspond to the figures in the previous pages that we have referred to. Now the revenue from the sales of gas is estimated at $1.0068 per M, and multiplying the M cubic feet sold in 1911 by this rate gives the revenue from sales of gas of the going plant for 1911 of $562,469. In addition to the revenue from the sale of gas the company as I have explained before has a small revenue from miscellaneous sales of .0005 per M which in the going plant in the year 1911 amounts to $279. The going plant does not receive interest on unemployed capital therefore the gross revenue is the sum of the two preceding revenues or $562,748. It is next necessary to estimate the operating expenses of the going plant and this I have taken at $.5833 per thousand feet sold which is the figure shown at the bottom of the table total estimated operating expenses of the going plant for the year 1911. That reduced to dollars amounts to $325,782. That amount is the operating expenses

1367 less taxes and depreciation of the going plant for the year 1911. The taxes of the going plant which I have estimated in the year 1911 at $42,431 are estimated in detail on page 146 of my report. The amount of money to set aside for depreciation I have taken at 10 cents per thousand feet sold and this amount in dollars estimated for the going plant for 1911 is $55,867. The total operating expenses therefore of the going plant for the year 1911 is estimated at $424,170 which is the sum of the operating expenses less taxes and depreciation, plus taxes, plus depreciation. Deducting total operating expenses estimated to be $424,170 from the gross revenue $562,748 leaves an estimated net earning of the going plant for the year 1911 of $138,578. Now in order to compare the earnings of the going plant to the comparative plant to be subsequently worked out I reduced the net earnings to their present worth using an interest

rate of six per cent. This results in a factor for one year of .9434 and applying this factor to the net earnings for 1911 of the going plant results in the present worth of the net future returns of this plant for the year 1911 of $139,774.

Q. Have you gone through each year in the same way for the going plant?

A. Yes, sir.

Q. Following that is the comparative plant? What difference is there between the two computations.

A. There is this difference that the comparative plant is not in operation during the years 1911 and 1912 but during 1911 — 1912 the comparative plant enjoys a revenue from the interest on unemployed capital as before explained. After 1912 that is beginning with the year 1913 the comparative plant begins to sell
1368 gas and therefore enjoys a revenue not only from interest from unemployed capital but also from the sale of gas. During the years 1911 and '12 inasmuch as the plant is not operative—I am speaking now of the comparative plant there would be no operating expenses and no taxes chargeable to operation. However, depreciation begins immediately and I have made a calculation of the amount to set aside for depreciation. Otherwise the calculation follows the same general lines as that of the going plant.

Q. .Now with reference to the matter of depreciation under the per M column where you have ten cents on the going plant I see for 1911 you have 3.04 per cent?

A. Yes, sor.

Q. Running down to 1914, 89.2 per cent. After that it is at ten cents per thousand again? What do these verious per cent- mean in there?

A. During the years 1911 to 1914 inclusive, or rather during the years 1911 and '12. there is no gas sold by the comparative plant at all. Therefore, the depreciation for these two years could not be based upon the amount of gas sold and it is necessary in those years to base the depreciation upon the amount of property or amount of the investment. The figure 3.04 per cent used in 1911 results from estimating the percentage of investment compared to the total in that year omitting the real estate and that percentage in that year is 3.04. In the same way the percentage for the year 1912, results in a percentage of 23.7. Now in the years 1913 and '14, especially during 1913 the amount of gas sold is so light that if depreciation were set aside at the rate of ten cents per thousand feet sold it would result in a figure much below two per cent of the prop-
1369 erty. I therefore continued the percentage calculation up to and including the year 1914 after which sales of gas are at a point where in my judgment it is fair to apply the full rate of ten cents per thousand depreciation.

Q. One word more about that. In 1914 we have 89.2 per cent and the amount $58,550. That amount is 89.2 per cent of what?

A. That is 89.2 per cent of the physical equipment or rather the investment in 1914 as related to the final total investment leaving out of consideration real estate.

Q. You don't mean $58,550 is 89 per cent or 90 per cent of the total investment up to that time?

A. Not at all. Depreciation is based on that 89 per cent.

COURT: 89 per cent of the reproduction?

A. Yes based on the reproduction new value?

Q. You don't mean to say 89 per cent depreciation.

A. I do not. The depreciation is based on 89.2 per cent of the —I have got the exact figure here, in this case of $2,671,696 or $2,379,896 which at 2 per cent equals for the year $58,550.

Q. Then this 89 per cent represents the amount of the investment therefore the basis of the depreciation calculation up to that time.

A. I am mistaken on that Mr. Guernsey. The 89 per cent represents that in 1914 89.2 per cent of the total physical property is in operation and that amounts to $2,379,896. Now that is 89.2 per cent of the total reproduction new value less real estate. Now then the amount of depreciation $58,550 is derived from multiplying the depreciation as calculated in the going plant for the year 1914 by that 89.2 per cent. I was mistaken before in my assumption, I had that wrong at first.

1370 Q. Now this first calculation or tabulation here of net going value gives you the final column here as comparative plant which represents the difference in favor of the going plant in each year?

A. Yes, sir.

Q. That is its present worth of course I mean?

A. Yes, sir.

Q. What is the aggregate which you get there?

A. The aggregate of the differences of the present worth of net future returns if $532,659.

Q. Now having obtained this result from this first trial what do you do with this $532,659?

A. I use that to make a second trial calculation which is shown on the page following the first trial calculation. You will notice that on the second trial calculation in the upper left corner there is a column headed "Justifiable expenditure in developing business" and in this column you will find totaled the $532,659 derived from the first trial calculation.

Q. And distributed over the various years?

A. And distributed over the variou- years just as it is in the first trial calculation.

Q. This is not in the first trial calculation?

A. Well it is derived in the first trial calculation at the end of it.

Q. Now then how does that affect these interest calculations?

A. The addition of the amounts for justifiable expenditure for developing business increasing the total amount of the investment, therefore increases the amount of interest earned by unemployed capital as shown in the calculation at the upper right hand corner of the second calculation.

Q. Your going plant in this second calculation is it

1371 changed or not?

A. The going plant is exactly the same as in the first trial calculation. That remains the same throughout.

Q. And what if any changes are there in the calculation as to the comparative plant except these which arise our of the allowance to the comparative plant of this matter of interest?

A. That is the only change in the comparative plant with the exception that that produces changes in the earnings.

Q. These changes in interest followed out of course change the other items right straight through. What d-es this second trial give you as your difference between the two plants, the measure of this going value?

A. The second trial calculation naturally results in a lower figure and amounts to $509,146.

Q. Now what is your next step in your final calculation?

A. The next step if a complete calculation was made would be to use the figure obtained in the second trial calculation, namely $509,146 but in figuring this out I have made the necessary adjustments at once in the final calculation to make the result agree.

Q. What do you mean by making adjustments to make the result agree, you mean forcing a balance or things like that?

A. No, sir. If I had made a third trial calculation, if I had used the figure obtained on the second trial calculation of $509,146 I would have obtained a figure somewhat in excess of $509,146. Then I might have made a fourth, a fifth, a sixth and so on *moc* calculations narrowing down the difference each time between the figure derived by the calculation of assumed amount for going value until that would finally result in a figure when the estimate*d* of going value finally agrees with the amount shown by the
1372 calculation. By taking interest and making small adjustments in the estimated increments for each year it is not necessary to expend all this work and go through all these calculations and I have just simply shown the final calculations where I assumed the going value is $509,795 and where the result of the calculations shows the same figure.

Q. That is it proves to the dollar?

A. In this case it proves to the dollar.

Q. That is with reference to the aggregates. Now your column headed justifiable expenditure for developing business in the computation in the left hand upper corner of this last sheet is the column making *yp* the items of going value?

A. Yes, sir.

Q. Now what is the fact as to whether the aggregate not only checks but also the amount for each year?

A. The amount for each year's checks and the aggregate also checks. After making a number of these calculations the interest adjustments become simple.

Q. Turning back to page 17 is the amount $509,795 shown in your summary there as going value the amount ascertained by you in the manner just stated?

A. That is the amount and in my judgment represents a fair allowance for going value.

Q. Now Mr. Baehr have you reached a conclusion as to what would be the fair actual cost of reproducing the property of the Des Moines Gas Company used *used* and useful in its business of manufacturing and distributing gas in the said city as of January 1, 1911?

A. I have.

Q. And what in your judgment is that amount?

1373 Objected to as incompetent, immaterial and object to the witness as not competent.

A. The cost of reproduction new my judgment of the amount is $3,531,491.

Q. Now have you reached a conclusion as to the present value of the property referred to, that is the property of the Des Moines Gas Co. used and useful in its business of manufacturing and distributing gas in the city of Des Moines?

A. I have.

Q. What in your judgment was the actual reasonable value of that property on the 1st day of January, 1911?

Mr. BYERS: The question in that form is objected to as incompetent and immaterial.

Mr. GUERNSEY: What formal objection is made to the question?

Mr. BYERS: We stand on the record.

A. My judgment of the fair present, or depreciative value is $3,221,166.

Here the further hearing was adjourned until 9:30 A. M. tomorrow.

1373½ Tuesday Forenoon Session.

AUGUST 1, 1911—at 9:30 a. m.

All counsel for the respective parties present.

Testimony on part of complainant resumed as follows:

WILLIAM A. BAEHR, re-called for further direct examination, examined by Mr. Guernsey, testified as follows:

Q. Mr. Baehr, the last thing I asked you last evening was your estimate as to the value of this property of the Des Moines Gas Company used and useful in its business of manufacturing and distributing gas in the city of Des Moines on January 1, 1911. I wish you would state whether you have formed a conclusion as to the present value of this property, and if so, what such value in your judgment is.

Objected to on part of defendants as being incompetent and immaterial.

A. In my opinion the present value of this property is enhanced over the value of January 1, 1911, by the additional construction which has been carried on since that time and to some extent the alue is decreased by the extra amount of depreciation which has

taken place since that time; but as a whole my judgment is that the property is enhanced somewhat in value.

Moved on part of defendants to strike the answer as not responsive and incompetent.

Q. Now, referring to your report marked Exhibit 21, there are some general questions I wish to ask because I did not go through it item by item. In the first place, is the property which you refer to in this report and valued in this report the property which is described in the inventories Exhibits 15 and 16?

1374 A. It is.

Q. Now you have referred to buildings here, building 1-A and B; is the designation of the buildings the same as the designation applied to the same buildings in this inventory?

A. It is.

Q. And as to contents of the buildings, you have followed the inventory also?

A. I have.

The MASTER: You have compared them, have you?

A. Yes, sir.

Q. Now, I want also to ask you, Mr. Baehr, whether—ask you generally—whether the statements and estimates made by you and contained in this Exhibit 21 are each of them in your judgment true and correct.

Objected to on part of defendants as being incompetent and immaterial.

A. They are.

Q. And what is the fact as to whether the prices and costs taken by you in making up Exhibit 21, Mr. Baehr, were in your judgment in each instance reasonable, fair prices for the things to which they were applied at the time as of which the valuation was made?

Objected to on part of defendants as being incompetent and immaterial; the witness is not shown to be competent.

A. They were.

The MASTER: I notice in your itemized account of each building you have what is termed interest and taxes; that is added to the net construction cost of the material.

A. Yes, sir; I call the net construction cost the base figure.

1375 The MASTER: Now where is the summary on buildings?

A. It is on page 77, your honor; that is the final figure there at the top of the page.

Mr. GUERNSEY: You mean page 76, don't you?

A. Yes, 76 and 77.

The MASTER: That gives the total as of now, present value of net construction cost?

A. That gives the total construction cost on a basis of reproduction new.

The MASTER: Now where is the real estate given on the basis of the present value?

A. You will find that on page 17.

Q. May I make a suggesion there. Page 17, Mr. Baehr, gives this in the aggregate; now if you will turn to page 126, do we not find there the total reproduction cost or value of each building, its condition per cent, and its present value given in detail?

A. That is right.

Q. And then that total from page 127 is carried to page 17?

A. It is.

The MASTER: That is the buildings alone?

Mr. GUERNSEY: Yes, that is the buildings alone. We will make a memorandum showing these pages where they are classified, if that will be more convenient to you.

The MASTER: That would be very convenient to have.

Q. Now, Mr. Baehr, let us take the next one, contents of buildings, that follows the buildings, doesn't it, in each instance?

A The contents begin on page 126.

Q. And follow the same arrangement we followed before?

A. Yes, sir.

1376 Q. The contents begin at page 78 for the base and the additional items showing the total reproduction cost?

A. Yes, sir.

The MASTER: I think I understand that now.

Q. Now, are you familiar in connection with your business with the reasonable prices of the apparatus and machinery and things of that kind that are contained in this inventory and contained in your Exhibit 21, Mr. Baehr?

A. I am.

Q. And are the prices taken by you in each instance including your unit prices for labor and material as well as the prices for machinery, apparatus and other things in your judgment reasonable and fair?

Objected to on part of defendants as being incompetent and immaterial; the witness is not shown to be competent.

A. They are.

Mr. GUERNSEY: We now offer in evidence Exhibit 21.

Objected to on part of defendants as being incompetent and immaterial, being a mere memorandum made by the witness. We object to all that part of it that refers to the so-called items of additional cost as incompetent, immaterial and irrelevant and not an issue in this case. We object to that part of Exhibit 21 that refers to the so-called going value because it is incompetent, irrelevant and not an issue in this case. We object to all of the tables and computations and figures set out in Exhibit 21 for the reason that they are incompetent and immaterial, the competency of the witness as to those computations has not been shown; and for the further reason that it already appears that a large part of the computations and tables and figures are based upon memoranda and infor-

1377 mation furnished by other persons and it is mere hearsay and not the best evidence.

The MASTER: If I understand you, you don't make any objection because the witness' attention has not been called to each and every item?

Mr. BYERS: Not at all.

Defendants also make the same objection, incompetent and irrelevant, to all that part of Exhibit 21 that deals with mains under pavement, services under pavement and estimated cost of reproducing, tearing up and replacing the paving, and to all that part of Exhibit 21 that deals with crossings under railroads, street railways as to both mains and services, if there are any such, for the reasons heretofore stated; and we object to all that part of Exhibit 21 that deals with items 1, 2, 3, 4 and 5 as the witness has stated them here, being, 1 contingencies, 2 is engineering and superintendence. 3 legal organization, liability for casualty and fire insurance, 4 is taxes, and 5 is interest, for the reason that all of these items and proof with respect to these items is entirely immaterial and irrelevant to the question involved in this controversy.

In making this objections as heretofore stated, we waive the minute and detailed identification of the Exhibit of the figures of the several items contained in it.

The MASTER: As I understand that objection it applies to each and every item contained in it, waiving, however, the fact that the witness' attention has not been called particularly to the items?

Mr. BYERS: We are waiving the identification of this book but object to its fontents.

1378 Q. Mr. Baehr, I wish you would in a general way state whether this plant is adapted to the purposes to which it is put, that is, manufacturing and distributing gas to consumers in the city of Des Moines?

A. In my judgment the plant of the Des Moines Gas Company is well adapted to serve the city of Des Moines with gas, and the people of Des Moines. The plant is of sufficient capacity and still it is not overbuilt. The quality of the service is good for the reason that the average candle power, as shown by the Company's records for the year 1910, was 22.78 and the average British thermal units, or heat units, per cubic foot for the year 1910 was 600. These qualities constitute a good gas. The apparatus for making gas is good; it is modern apparatus. The mains are of fair size, so that the people even in the outlying districts receive sufficient gas pressure. I based my judgment in this respect on the inspection of the pressure tests last winter where I found that most of the city was receiving during the time of the *peal* load, that is, at the time of maximum consumption, a pressure of three inches water column or above that, with a few isolated instances of pressure down to possibly 2.5 inches. That constitutes first class gas pressure service. The management, the engineering and the supervision of the company appeared to me to be very good, and I think the plant in general is well adapted to Des Moines.

Moved on part of defendants to strike out the answer of the wit-

ness, all of it, for the reason that it is made up of conclusions based upon hearsay and upon records that are not before the Master. The answer is for that reason incompetent as a part is based upon hearsay, part is a conclusion and part is original testimony, and it so intermingled that it is impossible to separate it; therefore I move to strike the whole answer.

1379 Q. Mr. Baehr, will you please explain the necessity for surplus capacity in the plant of the Company?

A. In the first place, reserve capacity is necessary to good service. It is essential in supplying gas that the supply of gas be continuous and that it be not interrupted even for an instant. The reason of this is that in a city using gas there are always some gas burners open, that is, the gas is burning, and if the supply of gas were discontinued for one reason or another from the works these various burners which are open would remain open and subsequently when the supply of gas is again turned on a number of these burners would undoubtedly continue open and gas would stream into the rooms or buildings in which these burners are located. The result of this is great danger due either to asphyxiation or from explosions. Furthermore, there is necessity for reserve capacity on account of supplement breakage or accidents in portions of the generating apparatus. In addition to this it should be understood that a water gas generator, or rather a water gas set, meaning by that the generator, carbureter and the super-heater must be shut down in periods of from 40 to 100 days—depending on the amount of work that set does, or rather the amount of gas it makes—for the purpose of relining or recheckering the sets. During the time that the relining or recheckering takes place the water gas set is out of commission for several days and is not capable of making gas, and for that reason it is necessary to have other sets. The recheckering takes place more frequently than relining. Recheckering takes place at regular intervals because the brick becomes saturated with
1380 carbon and loses its efficiency. This shutting down of the water gas sets for recheckering or relining must not be confused with the daily shut down due to cleaning fires, the clinkering, which occupies an hour or an hour and a half each time and takes place once or twice a day, in some cases three times, according to the way the set is operated.

Q. Now, which is more economical, to have the surplus generator capacity or reserve generator capacity, or to have reserve holder capacity to take care in that way of the interruption of the work of the generators?

A. In general it is more economical to install additional generating capacity than it is to install additional holder capacity. By the installation of additional generator capacity the erection and construction of additional holder capacity may many times be put off a number of years. On the other hand, the erection and construction of additional holder capacity will not allow the putting off of additional generating capacity for possibly more than one or two years. In reducing this to a financial proposition, ordinarily

it is more economical, from a financial standpoint, to put in the additional generator capacity. In the case of the Des Moines plant, in my judgment it would be considerably more economical to put in additional generating capacity, although the necessity for additional holder capacity will not be obviated, as in the course of a very few years, in my judgment, an additional holder will be necessary. Roughly, it would cost about fifty per cent per million feet of capacity, in my judgment, in Des Moines to install additional holder capacity over and above additional generator capacity. I
1381 might add to that, that in my judgment it will be necessary to purchase additional real estate on which to erect the additional holder.

Q. Now, I wish you would state what expenditures, in your judgment, Mr. Beahr, could reasonably be expected as necessary in the near future in order to maintain the property of the complainant up to its present state of efficiency?

Objected to on part of defendants as being immaterial incompetent and irrelevant.

A. In the going value calculation I made an estimate of the future gas sales of the Des Moines Gas Company up to and including 1917, and from those figures I have estimated that the maximum day's send-out in 1917 will be, roughly, three and a quarter million cubic feet per day. The maximum send-out last year was 2,228,000 cubic feet, I believe; but in compiling my estimate of future sales upon which to base my judgment of going value, I kept the estimate of sales conservative so as not to exaggerate the going value. In my judgment, for construction purposes these figures would not be sufficiently safe. I made a rough calculation in a general way of the construction requirements for the next seven years, and in my judgment it will be necessary to purchase additional real estate upon which to erect a new holder. The largest present holder of the company is 1,100,000 cubic feet capacity, approximately, and in my judgment the next holder to be erected should not be less than two million cubic feet capacity. In attempting to place this holder upon the present real estate of the company I found there was no room upon which to erect it, and for that reason, in my judgment, it will be necessary to purchase real estate upon which to erect such a holder. In my further judgment the purchase of additional real estate will be such that if the two million holder were
1382 erected thereon it would practically use up the best part of the available space as the holder is round, and real estate is usually square or rectangular in shape, and for that reason it might become advisable to make the holder a three million cubic feet capacity in place of a two million. I have estimated the real estate which would be required at approximately $92,000. Now, in my judgment, it will be necessary to install additional manufacturing capacity at approximately two million cubic feet capacity, which is one 10 foot 6 generator set, plus certain additional apparatus through the plant, which I estimate to cost $164,000. The three million holder I estimate will cost $250,000, complete. In

my judgment in the next seven years the main mileage will be increased from 50 to 60 miles, or approximately thirty per cent increase over the present mileage. This I estimate will cost approximately $400,000. I have estimated that the approximate increase in population in the next seven years will be 20,000, an increase of about 23 per cent from the present population. On this basis I have estimated that the increased investment in meters and services will be about $150,000, making a total of $1,056,000. Now if it is decided to build a two million holder in place of a three million cubic feet holder, I would deduct from that holder the sum of $75,000, leaving a total of $1,981,000.

Q. Mr. Baehr, will you tell us what reasons there are, if any, in your judgment, why this real estate which is occupied by the manufacturing plant is especially adapted to the uses of this Company?

A. There are various reasons why the real estate is desirable and especially adapted to the use to which it is put. In the first place the plant and ground is above flood line and on that account there is no danger of interruption of the service. In the second
1383 place the track facilities are excellent. The loading and unloading, receiving and shipping material are facilitated very much for this reason. The plant is so located on the Des Moines river that they are able to pump a water supply for general work service by pumping the water from the river and in that way saving money in the purchase of water. The central location of the plant enables the men who are working there to reach it readily, and furthermore, the engineer and superintendent can reach the plant rapidly in case of accident. The location of the plant is very near the center of distribution. This is a highly desirable feature, because it not only shortens the feeder mains required, but also decreases their size and in that way tends towards economy. The area of the plant is well drained, and this is a desirable feature. The plant is so located that men and wagons starting from the feeding shop start practically from the distribution center and that effects a large saving not only in time, but in the cartage of all kinds of supplies, pipes, stoves, fittings, etc. The present real estate has another feature of value, which is that it is large enough for extension of the manufacturing capacity, with the exception that additional ground is needed for the erection of a holder. The general condition of the soil of the real estate is favorable; it is good ground for foundations, not marshy, and does not require tiling. There is one additional feature that I consider is a desirable feature, and that is that the elevation of the plant with reference to the general elevation of the city is such that the plant is below that general city elevation. In a low pressure gas distribution system this is a desirable feature because air being lighter than gas tends to rise and this in a measure overcomes a portion of the friction in
1384 the feeder mains and tends to economy and to good service.

The MASTER: Is that true in the territory south of the Coon?

A. I can't say specifically in that respect. I have in mind the higher portions of the city I have seen.

Q. Now another thing about your Exhibit 21, that is in making your valuations, did you take the widths of the trenches as given in the inventory, or did you rely upon your own judgment and experience as to that?

A. I paid no attention whatever to the inventory in that respect, but used my figures as to the width of trenches.

Q. I think the inventory also estimates the amount of trenching and paving and laying of services, state whether your estimate is based upon that or upon factors determined from your own experience?

A. My estimate is based entirely upon my own experience in that respect.

Mr. GUERNSEY: There is one question suggested with reference to the objection made to Exhibit 21, we might as well clear up before finishing the direct examination of this witness. Among other things, it is objected to as a mere memorandum; if that is to be construed as an objection, we will have to show that. Will you tell us, General Byers?

Mr. BYERS: I have already stated that we do not object to the manner or rather to the form in which the exhibit is gotten up, or that the witness has not dealt with each detail in the exhibit; we waived the requirements, but insist even if that all had been done, still the exhibit would be incompetent for any purpose in this case.

Mr. GUERNSEY: On what is the objection that it is a mere
1385 memoranda predicated?

Mr. BYERS: It is this: you cannot substitute this witness for proof that exists in an original form.

Mr. GUERNSEY: So far as that goes we expect to supplement the testimony of this witness as to the matters which are furnished him by the testimony of people who furnished it.

Mr. BYERS: Of course, that is all a matter for the record and for the court.

Mr. GUERNSEY: As I understand your objection, you make no objection that would not be equally available if the witness had gone through this exhibit item by item and had testified to the reasonableness of each item.

Mr. BYERS: No, I have already stated that; it is in the record.

Judge CARR: As we understand it, there is no objection to Exhibit 21 because of the fact that the witness' testimony or a part of it appears in that form.

Mr. BYERS: That is correct.

Judge CARR: Except as to the substance, you do not object to the form?

Mr. BYERS: That book is not testimony at all; that is my notion.

The MASTER: Of course if the witness' attention had been called to each and every item there would be no question about it; and we have considered it that way; that is the way I understand it.

Mr. BYERS: The only exception I take to that is, still it would not be evidence, but a mere memorandum to aid the court, if it wants to use it.

1386 Cross examination by Mr. BYERS:

Q. Where is your office?

A. My office is in the Peoples Gas Building, corner Michigan Avenue and Adams Streets in Chicago.

Q. On the same floor with Mr. Lea?

A. No, sir; my office is on the twentieth floor and I believe Mr. Lea's office is on the fifteenth floor.

Q. You are in the same building?

A. Yes, sir.

Q. What time in 1910, if at all, did your employment begin for the present company?

A. I spent January 1st and January 2nd of 1911 in Des Moines; prior to that I had never been in the city.

Q. January 1st and 2nd, did you say?

A. Yes, sir of 1911.

Q. Now, on these two days, who of the other engineers did you meet here?

A. I do not recall meeting any other engineer here, Mr. Byers, if you mean somebody outside of the city.

Q. Yes, I mean any of those gentlemen that are now interested in this controversy as witnesses or in any other way?

A. I didn't meet anyone at that time, except Judge Carr and Mr. Read, but no outside engineers.

Q. Now, then, did your employment begin at that time?

A. It began January first, 1911.

Q. And what in a brief way led up to the employment, who did you have negotiations with?

A. On the day prior to January first, 1911, I had a long distance telephone call requesting me to come to Des Moines at once and I left Chicago that evening, arriving here on the morning
1387 of January 1st.

Q. And the long distance call was from the Des Moines Gas Company?

A. It was, yes sir.

Q. And it was in response to that call you came on the 1st of January?

A. Yes.

Q. Now, do you have any employment for the United Gas Improvement Company now?

A. I am not doing any work for the United Gas Improvement Company.

Q. Have you, in the recent past?

A. I do not recall that I have been employed by the United Gas Improvement Company.

Q. You do not remember of such employment?

A. I do not at the moment.

Q. Have you been doing any work for the Companies that are controlled by the United Gas Improvement Company so far as you know?

A. I have done work for the Des Moines Company, and as stated

in my—I don't know what the legal term is—my affidavit, perhaps opening statement, I did some work for the Minneapolis Gas Light Company.

Q. That concern is owned by the United Gas Improvement Company?

A. I am not sure that that company is owned by the United Gas Improvement Company, but I understand they have an interest in that company.

Q. Is that the only one you remember now that you did work for in which they were interested?

A. I might look through that list I had to see whether I did any work in which the United Gas Improvement Company is interested.

Q. Did you work for any of these companies: Allentown
1388 Gas Co.?

A. I have not.

Q. The Burlington Gas Light Company, Burlington, Iowa?

A. No.

Q. Chester County Gas Company, Westchester, Pa.?

A. No.

Q. Concord Light & Power Company, N. H.?

A. I have not.

Q. Connecticut Railway & Lighting Co., New Haven?

A. No.

Q. Consumers Gas Co. Reading, Pa.?

A. No.

Q. Dauphin County Gas Co. Steelton, Pa.?

A. No.

Q. Des Moines Gas Co. Des Moines, Iowa?

A. Yes.

Q. Prior to this present employment?

A. No, sir.

Q. Equitable Illuminating Gas Light Co., Philadelphia, Pa.?

A. No.

Q. Essix & Hudson Gas Co., Newark, N. J.?

A. No.

Q. Fulton County Gas & Electric Co. Gloversville, N. Y.?

A. No.

Q. Georgia Railway & Electric Co. Atlanta?

A. No.

Q. Harrisburg Gas Co., Harrisburg, Pa.?

A. No.

Q. Hudson County Gas Co. Jersey City, N. J.?

A. No.

Q. Kansas City Gas Co., Kansas City, Mo.?

1389 A. No.

Q. Merion & Radnor Gas & Electric Co., Ardmore, Pa.?

A. No.

Q. Minneapolis Gas Light Co., Minneapolis, Minn.?

A. Yes.

Q. New Gas Light Co., Janesville, Wis.?

A. No.
Q. Northern Liberties Gas Co., Philadelphia, Pa.?
A. No.
Q. Omaha Gas Co., Omaha, Nebr.?
A. No.
Q. Paterson & Passaic Gas & Electric Co., Paterson, N. J.
A. No.
Q. Haven't you been retained by the Omaha Company?
A. No.
Q. Pensacola Gas Co., Florida?
A. No.
Q. Peoples Gas Light Co., Manchester, N. H.
A. No.
Q. Philadelphia Gas Works?
A. No.
Q. Public Service Corporation, Newark, N. J.
A. No.
Q. St. Augustine Gas & Electric Light Co.
A. No.
Q. Sioux Falls Gas Co.?
A. No.
Q. Savannah, Gas Co., Savannah, Ga.?
A. No.
Q. Sioux City Gas & Electric Co., Sioux City, Iowa?
1390 A. No.
Q. South Bend & Mishawaka Gas Co., South Bend, Ind.?
A. No.
Q. Syracuse Light & Power Co., Syracuse, N. Y.
A. No.
Q. Vicksburg Gas Co., Vicksburg, Miss.?
A. No.
Q. Waterbury Gas Light Co., Waterbury, Conn.?
A. No.
Q. Wyandotte County Gas Co., Kansas City, Kans.?
A. No.
Q. And the Minneapolis and Des Moines Companies are the only two of that list that you remember?
A. Yes, sir.
Q. You have been in St. Louis several years in connection with the Gas Company's works there?
A. Yes, sir.
Q. And are thoroughly familiar with the gas situation of St. Louis?
A. I am familiar with it up to the time I left there.
Q. I understand you left there about two years and a half ago?
A. I left St. Louis at the end of March 1909.
Q. Now up to that time your employment or rather your engagements had been largely in the operation of gas plants?
A. They have been largely in the operation, and construction also.
Q. Up to the time you left St. Louis and went to Chicago?

A. Yes, sir.

Q. And had you ever had any employment prior to your going to Chicago from any cities or municipalities anywhere with respect to fixing valuations on gas properties?

A. I was not employed by any city or municipality prior
1391 to leaving the employment of the La Clede Gas Light Co., in St. Louis, on rate cases or valuations for rate purposes.

The MASTER: Prior to April 1, 1909?

A. Yes.

Q. In that connection had you been employed prior to that date by gas companies or any other interests for that matter, in the invoicing and placing of value upon gas properties prior to April 1909?

A. Yes, sir; a great many of them.

Q. And about how frequently, in a general way, say over a period of six or seven years just prior to April 1909?

A. I stated——

Q. If you will notice I have in my question, fixing values; I know you stated in your examination in chief you had done a great deal of work, but I do not remember that you stated you had valued gas properties prior to that time?

A. I valued a number of gas properties prior to April 1st, 1909, but off-hand it would be difficult for me to say how many a year.

Q. I have no notion of going into the details or places, but just in a general way I thought I would like to have you give us an estimate of the number?

A. I can do that in the following way: During the time I was employed by the Denver Gas & Electric Company of Denver, Colorado, I made three valuation reports.

Q. On their plant?

A. No, sir, on the plants at Leadville, Colorado, Boulder, Colorado, and Greeley, Colorado.

Q. Those valuations were made for owners of the gas plant or contemplated purchasers?

A. Yes, sir; during the time I was at St. Louis I made valuations on about twelve properties and in addition to that all the gas
1392 plants operated by the Western United Gas & Electric Company. This latter company owns or controls the property at Elgin, La Grange, Aurora, and Joliet, Illinois, and I think about smaller villages in that neighborhood.

Q. And that work was all for gas companies, anyway not for municipalities or cities.

A. Yes, sir.

Q. When you were answering Mr. Guernsey's general questions this morning about this plant, were you using a memoranda?

A. I have some memoranda here, yes sir.

Q. From which you refreshed your recollection as you were making the answers?

A. Yes, sir.

Q. Now, about April, 1909, you went to Chicago and opened up

your office and started in to work as consulting engineer, if I remember correctly?

A. Yes, sir.

Q. Are you a graduate of any technical school of engineering?

A. Yes, sir; I am a graduate of the University of Wisconsin, Madison, Wisconsin.

Q. Was your training there along technical lines in gas engineering or general engineering?

A. The course I took was a civil engineering course; that is the one I graduated from.

Q. Immediately, as I remember, after your graduation you became interested in work about gas plants?

A. It was some three years or two and a half years after graduation before I got into the gas business. That period of two and a half years being occupied to a certain extent by surveying
1393 work, but mostly by drafting and designing work in bridge works.

Q. What year did you graduate up there?

A. In 1894.

Q. So that it would be somewhere between 1896 and 1897, safe to say in 1897, you began your work with the gas companies?

A. The date I believe I stated before is March 1897 when I first went into the gas business.

Q. Up until April, 1909, you had devoted your entire time and energy to either the operation or construction of gas properties for the owners?

A. In the employ of the owners, yes sir.

Q. So that when you went to Chicago to open up your office your intention was, I suppose, to specialize along gas lines, gas engineering lines?

A. Yes, that was my intention although I am doing work in connection with electric light plants.

Q. Now, I wish you would tell us in a general way just about what the employment or work of a consulting gas engineer as the profession is carried on in Chicago, what it is?

A. Well, in a general way, my work covers the reports on gas properties and electric properties for bond houses or purchasers of such properties; the valuation of properties in cases like this one in Des Moines. I am operating two gas plants and one electric plant as consulting engineer; one gas plant at Oshkosh, Wis., a town of about 33,000 people.

Q. Now, just there, who owns that plant?

A. Mr. Edgar P. Sawyer and family of Oshkosh; and also am operating a gas plant at Greeley, Colorado.

Q. Who owns that plant?

A. That is owned largely by Mr. Clarence Darrow, of
1394 Chicago. In addition to that I have done such work—for instance, I am just completing an exhaustive study and survey of gas pressure conditions on Manhattan Island for the Public Service Commission for the First District of New York. I am also building a gas plant for the city of Wheeling at the present time.

Q. Now, these two plants that you say you are operating, do you mean you are superintending the operation of the plants, or what do you mean by saying that you are operating them?

A. Well, the gas plant at Greeley, I am virtually directing the policy of the company, mostly by correspondence because it is a long ways from Chicago; and I am also laying out the improvements as required and if questions of price or anything of that sort comes up they come to my office, and the local managers refer all questions of improvements to me.

Q. And your client in that case is the owner of the plant, Mr. Darrow?

A. Yes, sir.

Q. And what you are doing with respect to additions and improvements and operation and with respect to prices is in his interest or for him?

A. Yes, sir.

Q. Now, at Oshkosh, what do you mean by operating that plant?

A. The Oshkosh Gas Light Company owns and operates the gas plant and electric light and power service of Oshkosh, Wisconsin, and my duties there are to lay out and plan all improvements and in that connection I secure the prices of all the important apparatus and submit them with recommendations to Mr. Sawyer, requesting his approval before finally closing contracts. I also go to Oshkosh frequently, usually once a month and spend one or two or
1395 three days, as may be necessary, during which time I visit the plants and confer with the superintendents and direct them what they shall do; all important extensions are referred to me for advice and approval to see whether they are right or not, and such things as wages of men, even such things as vacations of employés come to my office.

Q. I take it from that employment, the fact that your employment is so general, that you also determnie the price in a way?

A. Of gas you mean and electric light?

Q. Yes.

A. I am just now making a valuation of both gas and electric light properties in Oshkosh for the purpose of determining the rates.

Q. How large is the city of Oshkosh?

A. My recollection is the last census gave it approximately a population of 33,000.

Q. More than one gas company there?

A. No.

Q. This Sawyers company has a monopoly on the gas business?

A. In that city, yes sir.

Q. I mean in that city. What rate are you getting there now?

A. The rate for gas at present is—they use two meters system there; that is, there is one rate for illuminating gas and one rate for fuel gas. It is exactly the same gas but used through different meters for different purposes. The net illuminating rate is $1.25 per thousand cubic feet; and the fuel rate is *is* one dollar net per thousand cubic feet on a sliding arrangement, so that when used in large quantities, the consumer of fuel gas using a sufficient quantity gets

a rate of ninety cents over and above the first twenty thousand feet any one month; I may be mistaken as to the twenty thousand feet; that may be fifty thousand.

1396 Q. What do you mean by net rate, $1.25?

A. If gas bills are paid within a certain time after they are rendered in Oshkosh, the rate for gas in the case of fuel for instance, is one dollar and for illuminating is $1.25, which we call the net rate. If the party does not pay the bill by a certain date the gross rate applies which is a greater rate.

Q. What is it?

A. The illuminating gross rate $1.75; I am not sure of the gross rate for fuel, but I believe it is either $1.15 or $1.25 per thousand.

Q. Can you give us in a general way, without taking time to figure it out, about what average rate the company actually gets in Oshkosh?

A. My impression is that the average rate is something like, well, say somewhere around $1.10 per thousand; that is just my judgment.

Q. Is there a controversy on there now for a reduction in rates?

A. No, sir.

Q. Now the Greeley, Clorado, plant, how big a town is that?

A. That is a town of about 8,500 or 9,000 people.

Q. A small place?

A. A small place.

Q. The gas company there has a monopoly on the gas business?

A. Yes, sir.

Q. What is the rate there?

A. The net rate is $1.50 per thousand through one meter.

Q. Now, is there any other gas properties in which you have an interest either as an operator or a financial interest?

A. I have a small interest in the gas plant at Beloit, Wisconsin.

Q. You mean financial interest?

1397 A. Yes, sir.

Q. Any other?

A. No, sir.

Q. Do you own any stock in any other gas or light company of any kind?

A. No, sir.

Q. This one at Beloit, Wisconsin, is that the only gas company there?

A. That is the only gas company there.

Q. That is a town of about 15,000?

A. I think it is from 15,000 to 17,000.

Q. And the gas company has a monopoly on the gas?

A. Yes.

Q. What is the present rate there?

A. Well, I don't know; I think it is $1.25 but I don't know.

Q. Did you have anything to do with the management of it?

A. No, sir.

Q. Your interest is not large enough?

A. It is very small.

Q. Is that a corporation?

A. Yes, sir; the name is Beloit Water Gas and Electric Company.
Q. So you are interested in it as a stockholder?
A. Yes, sir.
Q. Now, since April 1st, 1909, what has been your employment in a general way without going into the details?
A. Generally, as consulting engineer of gas and electric properties, making valuations and gas pressure reports and building and operating gas plants and one electric plant.
Q. The gas pressure proposition is really your specialty?
A. Why, not necessarily; I think I feel equally competent in gas works as in gas distribution.
1398 Q. How much of your time since April 1909, has been devoted to valuing gas plants?
A. I should say that the majority of my time was devoted to that work.
Q. In fact that was really the first work you did after you opened your office?
A. Yes, sir.
Q. And with whom was your engagement at that time?
A. About the first valuation work that I did was at Atlantic City, New Jersey, Lansing, Michigan, Litchfield, Illinois, Wilmington, Delaware, and Amarilo, Texas.
Q. And that employment was all for gas companies?
A. That was all for the owners or the company.
Q. Now, Mr. Baehr, who is the principal owner of the Belot Company?
A. I believe that company is controlled by a trust company in Cincinnati.
Q. Who besides yourself in Chicago is interested in it, has some considerable interest in it?
A. I don't know.
Q. Has Mr. Cowdery any interest in it?
A. I believe he has, but that is not based on absolute knowledge.
Q. Mr. Cowdery is at the head of the Chicago Gas Company?
A. Mr. Cowdery is the vice president of the Peoples Gas Light & Coke Company.
Q. Now, since April, 1909, have you been employed by any municipality or city for the purpose of making up a valuation of gas properties for rate making purposes—leave out of that now your pressure and all that sort of thing—just rate making purposes?
A. I do not believe I have been employed for such purposes.
1399 Q. Have you since April 1st, 1909, been employed by any municipality or city for any purpose in connection with gas properties?
A. Yes, sir; in the city of Wheeling and the city of Buffalo.
Q. Now, take the city of Wheeling first. If I understand your answer in chief that is a municipally owned plant, that is, the municipality owns the plant?
A. Yes, sir.
Q. And what was that particular service there, that is, what part of the business of the gas plant did you have to do with, what was the nature of your work?

A. At first when I went to Wheeling it was for the purpose of investigating the operating conditions of the gas plant and distribution system and I made a report on that which also embraced the improvements required to put the gas plant and distribution system in good shape.

Q. When you went the next time, what was the purpose then?

A. There was quite an interval of time between the time my report was turned in and the time action was taken by the city of Wheeling, but action was taken this last spring and I am now in charge of building a new gas plant there, overhauling the mains and relaying the services and getting the meters into condition.

Q. Does that general statement cover the only employment you had at Wheeling, or rather the character of your work?

A. Yes.

Q. It was not then in the nature of making up a complete inventory and fixing the value of each particular item and valuing these so-called overhead charges?

A. Not in Wheeling.

Q. Now, Buffalo is the other city?

1400 A. Yes, sir.

Q. When was it you were employed in Buffalo?

A. That is very recently, within two or three months.

Q. That report has not been made yet?

A. That was a report concerning improvements at the gas plant at Buffalo.

Q. I don't want it unless it was valuation?

A. It was not valuation.

Q. In the Wheeling matter I take it from what you say your report covered improvements that would be necessary for some few years in advance of the time you made your report?

A. It covered improvements that I recommended to the city of Wheeling that they make at once.

Q. And did you put the cost of the improvement in your report?

A. Yes, sir.

Q. What items of overhead charges did you include?

A. I included in that engineering and superintendance. I did not set those items aside specifically; I included those in the amount in totals, but contingencies, engineering and superintendence were the items I considered at that place.

Q. No tax and interest or going value or anything of that kind is covered by that report?

A. No, sir.

Q. And no organization or legal expense?

A. None.

Q. Now, those two are the only cities for which you have rendered services with respect to gas properties since April 1909?

A. I rendered services to the city of New York in connection with the Brooklyn Union Gas Company.

Q. I mean in valuation?

1401 A. Yes, there was a valuation of the property in Brooklyn.

Q. When was that work done?
A. That was started last winter and is not finished.
Q. And your report is unfinished?
A. It is unfinished, yes sir.
Q. Now, Mr. Baehr, you first came to Des Moines on the first day of January?
A. Yes.
Q. Had you ever been here before?
A. I had never been in Des Moines before then.
Q. And you were here two days at that time?
A. Yes.
Q. You never bought or sold any real estate in Des Moines?
A. I did not.
Q. You never either was interested as a contractor or bidder or owner in the construction of buildings or anything of that kind in Des Moines?
A. No.
Q. Now, after the second day of January, when did you next come to Des Moines?
A. I next came to Des Moines on February 6th.
Q. That is 1911?
A. That is 1811.
Q. Whom did you meet at that time?
A. I met the officials of the company, Mr. Haines and Mr. Vincent.
Q. Were there any other engineers there, Mr. Lea—I have forgotten the other gentleman's name—Mr. Randolph?
A. I don't remember their being here at that time.
Q. When did you first meet with them, if you did at all,
1402 after your employment, where was the meeting?
A. I believe in Chicago; the exact time I cannot give you, but it was early in the year.
Q. Who was present?
A. There were present various gentlemen from the United Gas & Improvement Company, Mr. Lea and I believe Mr. Randolph.
Q. Any other engineers besides Mr. Lea and Mr. Randolph that you now remember?
A. None outside of the men from the United Gas Improvement Company.
Q. The men I mean from there, if you can give me their names?
A. Mr. Klump and Mr. Heminger were the engineers from the United Gas Improvement Company.
Q. Was counsel for the company present?
A. Yes, sir.
Q. Can you give me some idea of the date, how soon it was after the first of the year?
A. I am sorry I cannot give you that, but it was early in the year.
Q. Was it in the month of January?
A. I believe it was in the month of February; I am not sure of that.
Q. At any rate, it was early in the work?
A. Yes, sir.

Q. Now, at that conference or meeting of counsel and engineers were you advised as to the character of the controversy that was on here and the purpose of this gathering of engineers and their employment, and so on, in a general way?

A. I had been advised in a general way of the nature of the controversy prior to that.

Q. That is, by some person connected with the Des Moines Gas Company that informed you?

A. When I was here on the first and second of January I
1403 understood the matter involved was a rate regulation case.

Q. Were you informed in a general way as to what the range of contention was?

A. My understanding at that time was that the city had passed an ordinance fixing the price of gas at ninety cents.

Q. And you understood that the rate in force at the time of the passage of the ordinance was a flat rate of one dollar?

A. I understood the rate was one dollar net.

Q. With the usual penalty for failure to pay on or before the 15th of the month?

A. Yes, sir.

Q. Were you also advised by somebody in connection with the Gas Company that the controversy had reached the courts and that the valuation and estimates were for the purpose of using them in a law suit and as evidence?

A. I understood that in a general way, yes sir.

Q. Now at this conference of counsel and engineers did you take up the question of these so-called intangible values, like going value and taxes and interest and pavements and so on?

Objected to on part of the complainant as not competent because it is a conference with the witnesses and their counsel and their clients and no matter that was gone into on the direct examination at all and not a proper subject of cross examination. I may say, if your honor, please, Mr. Read and Judge Carr and myself were all present at this conference. It is rather a remarkable cross examination.

The MASTER: I think it is competent to show the fact.

Mr. GUERNSEY: The record may show that we have not put any witness on the stand without conferring with him about
1404 the subject matter of the testimony.

Mr BYERS: It is proper and competent in this way, and has been so held. It is entirely proper for us without and reflection upon counsel or the witness, and I do not want anybody to get the notion that the question is for the purpose of in any way reflecting upon anybody, but it is perfectly competent and proper in view of the fact that here is an element that the men of this profession say has been of uncertain proof and standing and it is an element of value that has only recently been worked out; now it is entirely proper for us as bearing upon the weight of the evidence of this witness to show that the result of that conference was a sort of general understanding to proceed along certain lines in fixing these valuations; that goes

to the weight of the testimony of this witness and don't affect their probity.

The MASTER: So far as this question is concerned, I haven't any question about it.

Last above question repeated.

A. There were a great many things discussed and I believe, among others, that there was some discussion on the features you mention.

Q. Now, you understood at the time too, Mr. Baehr, I assume, that Mr. Lea had employment in this same matter that you had been employed in?

A. Yes.

Q. And for the same purpose and that his work was to cover the same field?

A. I presumed it was at that time.

Q. And Mr. Klump, you knew that he was probably employed for the same thing?

1405 A. Mr. Klump is with the United Gas Improvement Company. I don't understand that he was employed in the same way that Mr. Lea or myself were.

Q. You understood, however, that he was interested in the same matter in the same work that you were to cover whatever his employment might be?

A. I presume so, yes.

Q. And he has been here right along and checked up this work?

A. I don't know what checking he has done, but he has been here.

Q. Now, in that conference at Chicago, was Mr. Alvord present?

A. In the conference I had in mind, the first one, held early in the year, Mr. Alvord was not present.

Q. Was he during the winter some time?

A. There was a conference at which Mr. Alvord was present.

Q. When was that held?

A. I can't tell you exactly, but it was subsequent to the first one.

Q. Can you give us some idea how long it was afterwards?

A. I think it was subsequent to the first of March.

Q. Was it as late as April?

A. I would be unable to say. I think I can say definitely since the first of March; that is as far as my recollection carried me.

Q. Was it after the reports had been worked out and about ready to be put in form?

A. It was during the time my report was being worked upon.

Q. At this second conference, were these other engineers present besides Mr. Alvord?

A. I believe there was another conference at which Mr. Randolph, Mr. Alvord, Mr. Lea and myself were present.

1406 Q. Was Mr. Benezt Williams there?

A. No, sir.

Q. Was Mr. Haganagh present at either conference?

A. Mr. Haganagh I believe was for a short time at one of the conferences, but a very short time.

Q. First or second one?

A. I don't know about that; I am not sure on that.

Q. Where were these conferences held in Chicago?
A. At the hotel.
Q. Was Mr. Douthirt present?
A. Yes, Mr. Douthert I think he was at one of the conferences I am sure of; I am not sure that he was at both of them or all of them?
Q. At the hotel?
A. At the hotel.
Q. At the La Salle Hotel?
A. No, sir; the Blackstone.
Q. Now at this first conference Mr. Baehr, had any part of the engineers' reports, that is covering valuation, been made up?
A. Are you referring to my report, Mr. Byers?
Q. Any, yours or any others.
A. No, there was an inventory ready.
Q. That is the inventory of the items without any valuation you mean, something like is contained in Exhibit 15?
A. Yes.
Q. That had been made up so that you had it there at this conference?
A. Yes.

Q. Now at that time, do you remember whether any of the
1407 engineers had their figures so that they were presented at that conference?
A. I think there were some figures discussed.
Q. Didn't one of the engineers at that meeting state figures and valuations he had worked out on this plant?

Objected to on part of the complainant for the reasons last above urged and as immaterial and not cross examination; he is asking for what took place at this conference.

The MASTER: I think that is competent and proper cross examination, both.

Last question repeated.
A. There were some figures discussed and I believe, of course, in order to discuss them they were stated.
Q. Can you tell us what the figures that were stated and discussed referred to particularly?

Complainant interposes the same objection as last above.

A. They referred, as I recall it, to such matters as cost of brick work, cost of concrete, cost of lumber and carpenter work roofing and such matters.
Q. Now, were those figures stated by a consulting engineer as you remember it, I am not caring about the name of the person?
A. No, sir.
Q. You say it was not a consulting engineer?
A. No.
Q. Was Mr. Haines present?
A. I believe Mr. Haines was there, but I am not sure of that.

Q. Was it anybody that was entirely outside of this controversy and who is not here either as a witness or advisor?

A. No, it was not anybody outside.

Q. It was somebody interested in the controversy?

1408 A. Yes, sir.

Q. During that conference—we are dealing with the first one—was the question of the price of gas discussed in a general way I mean now by the engineers and by the other gentlemen present?

Complainant interposes the same objection last above made.

A. I do not believe there was any discussion about the price of gas, except there must have been some remarks that the city wanted to reduce the rate to ninety cents; but I don't remember any discussion about that.

Q. I suppose there was something said about the importance of the valuation as it related to prices.

Complainant interposes same objection last above made.

A. I do not believe there were any statements of that kind made.

Q. I don't mean now that anybody said you will have to fix a particular valuation in order to support our contention; I am trying to get a picture now from the beginning to the end of your mind and the things that may have influenced you when you come finally to fix a judgment and determine the fact; that is all I am trying to do, to get that before the Master's mind and my own, simply to weigh the testimony.

Complainant interposes the same objection last made.

A. The only statement I recall at any time concerning that, it was told me what the Company desired in this matter was to *to* know the fair value of the property; they wanted to know what the fair thing was, what was right and fair; that is all I recall.

Q. When that was stated did those several engineers that have taken part in making up the valuations and invoice discuss valuations along those lines at that conference?

Complainant interposes the same objection last made.

1409 A. At that time the things that were discussed were the prices of these particular classes of work, construction work. I have enumerated.

Q. Now, Mr. Baehr, you understand very readily this, I think that if several engineers were to deal with this property for the purpose of arriving at a valuation, the valuation later to be used in the trial of a case as evidence, that you would not proceed along entirely different lines, at least you would want to know before you started where you were all going to end?

A. I would think so.

Q. That is what I am trying to get at, not what was said and done, but was that line of discussion carried on in that conference in a general way?

A. I should think in a general way the discussion would trend along fair values, etc.

Q. Was there anybody present at that conference, any engineers aside from Mr. Alvord who made up a report of valuation that is not here present and has not been here during this session?

Complainant interposes same objection last made.

A. I never saw a complete valuation of this property outside of the valuation that there has been offered here by Mr. Lea and my own.

Question repeated.

Complainant interposes same objection last made.

Q. Let me put the question in a different way: How many engineers do you know that have made up a report fixing a valuation upon the property of the Des Moines Gas Company for the purpose of this controversy?

A. I know of three engineers, Mr. Randolph, Mr. Lea and myself.

Q. Were there any made by any other engineers?

1410 A. There were some figures made; whether they were completed or not, I don't know, by two other engineers.

Q. Who were they?

A. Mr. Klump and Mr. Heminger.

Q. Is Mr. Heminger connected with the United Gas Improvement Company.

A. Yes, sir.

Q. He is from that establishment?

A. Yes.

Q. Were there any others?

A. No, other engineers that I know of.

Q. The real question I am trying to get at, did an engineer, no other person, at the first or second conference make up a report of the valuation of this plant that is not here among these men you mentioned?

A. I don't think so. If there was, it is a failure of my recollection.

Q. Passing that conference for a few minutes, when after the second day of January did you come to Des Moines again?

A. On my next visit I arrived here Februart 6, 1911.

Q. And how long did you stay?

A. I stayed till February 8th inclusive, a total of three days.

Q. Was that visit the one that began on the 6th of February for the purpose of checking up the invoice to satisfy yourself as to what was there?

A. I started to do that work at that time.

Q. On the 6th of February?

A. Yes, sir.

Q. You were here until what date?

A. To the 8th inclusive.

Q. Did you come here on the morning of the 6th?

1411 A. Yes, sir.

Q. You left Chicago the night before?

A. Yes, sir.

Q. So you were here then three days at that time?

A. Yes, sir.

Q. Were there any other persons working at the same kind of work you did during these two or three days here? I don't mean repairers or day laborers, I mean engineers?

A. I don't think there was anybody here but my own man and myself at that time.

Q. Then you returned to Chicago?

A. Yes, sir.

Q. When did you come back again?

A. I arrived here on the morning of February 22.

Q. You are speaking now of the same year all the time?

A. Yes, sir; the year 1911.

Q. How long were you here that time?

A. I was here until March 9th inclusive.

Q. Did you get here just as you did before, in the morning?

A. Yes, sir.

Q. So that you put in eleven days?

A. No, sir; I put in at that time sixteen days in Des Moines.

Q. Counting Sundays and all?

A. Yes, sir; I worked Sundays.

Q. During those sixteen days you were checking up, measuring and proving the measurements and so on?

A. Yes, and was also working on the figuring.

Q. You did part of your work of making up your final report here in Des Moines during those sixteen days?

A. Yes, sir.

1412 Q. Did you have your office force or some of your office force here with you at that time?

A. I had one man here at that time.

Q. I mean not in your engineering department?

A. This was a young engineer, done engineering work.

Q. Now during those sixteen days were there of the other engineers who had placed valuations on this property present at any of this time doing the same class of work?

A. Yes, sir.

Q. Who was here?

A. I recall Mr. Lea was here.

Q. Anybody else?

A. I believe Mr. Randolph was here, but my recollection is not clear on that point.

Q. Did you use the Company's office or hotel for work, all of you?

A. I did most of my work at my room in the hotel.

Q. And the others some at the hotel and some at the office?

A. I don't know where they did their work, but they were at the hotel, Mr. Lea was.

Q. You all stayed at the same place while here?

A. Yes.

Q. Mr. Lea was working on his report during those sixteen days?

A. I believe so, yes, sir.

Q. When did you come back again?

A. On the morning of July 8th, 1911.
Q. For what purpose did you come at that time?
A. I have been here continuously since then.
Q. You came here to attend this trial?
A. Yes, sir.
Q. Then prior to July 8th you made three separate trips
1413 to Des Moines?
A. Yes, sir.
Q. The first one lasted two days, the second one three days and the third one sixteen days?
A. Yes, sir.
Q. Twenty-one days altogether?
A. Yes, sir.
Q. That covers your time in Des Moines from the time of your employment up to the first of July?
A. Yes, sir; up to the first of July.
Q. Now, when you came here the first of January, I suppose you met Mr. Haines first?
A. I did.
Q. I wish you would give to the reporter in as brief a way as you can and yet give us the facts, just what information, I don't mean about the law suit, but just what information he gave you the first day you was here with respect to the property?
A. The first day I was here Mr. Haines and myself visited the gas plant and made an inspection of the gas plant, and we also drove around the city to the outskirts in two or three directions. During this day we discussed the apparatus at the plant and the sizes——
Q. Now, Mr. Baehr, if you will accommodate me by confining as far as you can your answer to Mr. Haines' statement about the property—when you say we discussed, we can't tell who suggested the matter.
A. He told me the capacities of the holders and the number of miles of main pipe, the number of services and the number of meters and also a very brief description of the real estate owned by the company.
1414 Q. That was the first day?
A. Yes, sir.
Q. Was that information given to you in writing, did Mr. Haines reduce it to writing so that you had a memoranda to take away with you?
A. I think I made my own memorandum from his statements.
Q. But there was a memoranda taken, either he furnished it to you or you jotted down what he told you?
A. I believe I took a memoranda down myself.
Q. And that covered the capacity of the plant and miles of main and number of services and the real estate and the number of meters, can you think of anything else any other information furnished you by the company at that time?
A. Mr. Haines gave me, as I recall it, what in his judgment was an approximate value of the real estate.
Q. I think the testimony shows that the real estate had been

appraised before the first of January; wasn't what he told you the value the appraisers had fixed on it; that they had appraised it at so much?

A. Not at that time as I recall it; I don't think so.

Q. Then what other items of information, if any, was furnished to you either by Mr. Haines or any other person for the Gas Company?

A. I believe it was Mr. Haines who gave me what he considered an approximate valuation of the office furniture and fixtures and stable equipment.

Q. Anything else?

A. Yes, I believe I was furnished with a statement of the rate of taxation for 1910 in Des Moines.

Q. Well, was that furnished by somebody for the Gas Company?

A. Yes.

1415 Q. Now any other item you can think of?

A. That is all I recall at the moment.

Q. Now, then, when you came back on the 6th of February, what information or statement of any kind was furnished to you by the Gas Company, by Mr. Haines, or anyone else for the Company?

A. I believe it was at that time I was given a copy of the inventory of the property of the Gas Company.

Q. Is that the book that has been marked Exhibit 15?

A. Yes, sir.

Q. And anything else besides that Exhibit 15, at that time now, between the 6th and the 8th?

A. It is hard for me to recall just when I got some things that were given to me, but I believe I was furnished and I know I requested to have some statements prepared for me of the various purchases of material of certain kinds that the Company had made in recent years, and the cost of laying the services and that sort of thing, and I believe some of those things were furnished to me in the days that you mention.

Q. If they were furnished to you they were furnished in writing?

A. Yes, sir.

Q. And you took them away with you to your Chicago office?

A. Yes, sir.

Q. To be used in formulating your final report?

A. I used them for the purpose of forming a judgment on portions of the report.

Q. Now, in this last answer, as I have it, you were furnished a statement showing the purchases of material?

A. Certain kinds of material.

Q. What kinds, can you name the kinds?

A. I requested that a careful statement be prepared for me

1416 showing the purchases of cast iron pipe for the past five years; also a statement showing the purchases of screw pipe; that is, either steel or wrought pipe.

Q. Where the ends are put together with threads?

A. By screw threads. Also a statement of the cast iron specials purchased.

Q. What do you include in cast iron specials?

A. By cast iron specials I mean such cast iron pipe, fittings, T's crosses elbows, plugs drips and things of that kind.

Q. Drips line and side pots?

A. Yes, sir. I also requested a statement of the prices paid for small fittings, that is, fittings which we use on screw pipe. I also requested a statement of the cost of laying services for the past five years.

Q. Do you mean the labor cost?

A. The thing I requested there was a statement showing for services the cost of material and the cost of labor. I also requested a statement of the amount of the store room expense this Company incurred; in other words, what it cost them to operate their store room as expressed in the percentage of the cost of the material handled. I also requested information as to construction carried on at the plant at various times.

Q. For a period of five years?

A. That information extended back further than five years. I also requested a statement of the operating expenses of the Company.

Q. For how many years?

A. For about five years. I also asked for a statement of the amount of gas made each year for a number of years back; the amount of gas sold each year; the unaccounted for gas and a statement of gross income.

1417 Q. For how many years?

A. I requested that for five years or more and got it that way. And the operating expenses for the same period and taxes paid.

Q. Actually paid?

A. Yes, sir. I believe that covers the requests I made.

Q. Were all of these requests complied with by the Company and the information furnished to you in memoranda form that you asked for?

A. I believe I have all the information in memoranda form.

Q. That you took with you to your Chicago office and used it in making up your Exhibit 21?

A. Yes, sir.

Q. Now, when you returned for your last trip prior to the commencement of this proceeding, what information, if any, further than what you already related did you get from Mr. Haines or anyone else for the Gas Company?

A. I think some of the information I have just enumerated was given to me at that time.

Q. Without respect to the time when the information was furnished you will you please state in the record what other information at any time of any kind, if any, with respect to the character of the Company's property, the quantity of the property, the cost of it, the gross revenue, the net revenue, or any other fact in con-

nection with the property, was given to you by Mr. Haines or some person for the Company?

A. I have a map showing the extent of the distribution system, also a map of the city of Des Moines on which I indicated the three districts into which I divided the city for the purpose of computation in my report, and I believe I have two blue prints giv-
1418 ing data in the form of curves as to the past history of the Company.

Q. How was this all furnished, what you stated in this last answer, to you by the company?

A. Yes, sir.

Q. And were those two blue prints the blue prints that correspond and represent the same things as the curved sheets in Mr. Lea's report?

A. Those blue prints I have, give the facts only up to December 31, 1910.

Q. Up to that time they correspond and represent the same information or facts as are represented by Mr. Lea's two curve sheets in his report?

A. I believe they do.

Q. Now, is there anything else, any other information of any kind or any fact that you remember that was furnished to you by the Gas Company or any one for them?

A. I don't recall anything at the moment; there may be.

At this time an adjournment was taken until 1:30 p. m.

1419 1:30 p. m., TUESDAY, *August* 1, 1911.

WILLIAM BAEHR continued on cross examination by Hon. H. W. Byers, testified as follows:

Q. During the noon hour, Mr. Baehr did you think of anything else in the way—you remember what the last question was?

A. You asked me whether there were any other things I could think of which the company had given me. I have found some more Mr. Byers. There is a third blue print of development cur-es. I was under the impression there was only two, but there are three. Then I have a statement showing the average candle power, average heat value and dew point during the year 1910. Then I have some sets of prices, that is they are typewritten lists or unit costs of day work in Des Moines furnished by contractors, one by the name of Mardis and one by the name of Weitz. Then there is a detailed statement of gas sold from 1904 to 1910 inclusive by years. Then there is a statement of the history of the price of gas. There was also furnished a statement of holder cost for the past three years. Also a statement of gross revenue, operating expense, taxes and net earnings for the years 1887 to 1910 inclusive. A statement of gas sold from 1888 to 1910 inclusive by years. A statement of the population of Des Moines in 1880, 1890, 1900 and 1910. A small schedule of quantity and cost of coke and oil used in manufacturing gas. A statement of profit and loss for the years 1907, 1908, 1909 and 1910. A statement giving the record of mains laid by sizes

and for each of the years from 1888 to 1910 inclusive. A statement of the number of governors.

1420 COURT: What is that?

A. They are a small device for regulating pressures ahead of the meters. They are employed on services connected to the high pressure line. A statement of the working capital as of December 31, 1910. A statement giving consumption of meters by districts, meaning the districts used in my report. A statement giving the cost of laying mains and services divided into details for labor and material for some years past. A copy of a letter from a local contractor as to the cost of resporing pavements. A study of various methods of figuring life and age and depreciation. A statement of the cost of meters. A statement of the number of feet in size and mains in each of the districts. Those are the things.

Q. May I have that list just a moment?

A. Yes, sir.

Q. Now Mr. Baehr were all of the items covered by your last answer furnished to you by the company or some person for the company?

A. Yes, sir.

Q. And how many, if any, of the items covered by your answer did you request?

A. I believe I requested all of them.

Q. And your purpose in doing that was to get such information as you could to aid you in fixing the value of the property?

A. Yes, sir.

Q. Now this third blue print showing development by surves was that a blue print that corresponded and represented the same thing as is shown by the curve sheet No. 3 in Mr. Lea's report?

A. I can't say whether it corresponded to curve sheet No. 3, but I have three blue prints.

1421 Q. There are three curve sheets in his report are they not?

A. Yes, sir.

Q. And the last curve sheet that you refer to here the third one, did that extend beyond the year 1910?

A. It did not.

Q. Well would it be correct for me to say that then up to the year 1910 the blue print that was furnished to you does correspond with and represents much the same thing that is shown by Mr. Lea's curve sheet the third one in his report?

A. I believe so including the year 1910.

Q. I suppose to the 31st of December, 1910.

A. Yes, sir.

Q. Now the price list or price memorandum that you say was made by Mr. Mardis or by Mardis and one by Weitz, that was furnished you by the company.

A. Yes, sir.

Q. And not by these gentlemen that you named?

A. No, sir; these partisular lists were furnished to me by the company.

Q. And the history of the price of gas was furnished to you by the company?

A. Yes, sir.

Q. How early in your employment?

A. Well I didn't keep the dates on which I received them but I got some on my second visit and some on my third visit.

Q. Well I suppose this history of the price of gas, I suppose you mean by that the history of the local plant?

A. Yes, sir.

Q. Not the general history of the price of gas generally, but confined to this city.

1422 A. Yes, sir.

Q. And this plant?

A. Just simply a statement of the different prices at different times in Des Moines for gas.

Q. Do you remember the earliest period stated in the history?

A. I do not but I can find that out.

Q. You don't remember it now?

A. I don't remember it no sir.

Q. And the history was carried down I suppose to the dollar rate?

A. Yes, sir.

Q. You have stated in response to a question, and I hardly think the question was entirely fair, the things that might be involved in it. I suppose you did not request this blue print did you?

A. No, I did not request these blue prints, they were made up and given to me.

Q. Some of the other engineers made these and the company handed them to you or had them sent to you?

A. Yes, sir.

Q. The detailed statement of the gas sold from 1904 to 1910, you did request that did you?

A. Yes, sir.

Q. And the reason you did was because it was very important to have it in order to make up an intelligent estimate of the value of the property in this city?

A. Yes, sir.

Q. You regarded it as one of the important facts necessary to be known in advance?

A. I did, yes.

1423 Q. And the history of the price of gas you regardee that as important too?

A. I did.

Q. Now the holder cost past three years, I take it you mean by that the cost of gas in the holder and not the cost of the holder itself?

A. I mean the manufactured cost of gas in the holder.

Q. You requested that information from the company?

A. Yes, sir.

Q. Because you regarded that as information that was necessary to form an intelligent estimate of the value of the plant.

A. Yes, sir.

Q. Now the gross revenue and operating expenses—I will start with gross revenue. You asked for that information?

A. Yes, sir.

Q. And did you indicate in your request the period over which you wanted the information to go?

A. I believe my request was verbal and was to the effect that I would like to get a statement of the gross income for the past five years and as many years prior as I could get it.

Q. You don't distinguish at all or don't mean the gross income as distinguished in revenue in any way do you?

A. No, sir.

Q. They mean the same thing as you used them, you used gross revenue here that is the reason I did.

A. Yes, sir.

Q. You requested that information because that was not only important but a necessary thing to know in order to arrive at an intelligent and correct judgment of the value of the property of the company?

1424 A. Yes, sir.

Q. Now do you remember without going to your memorandum the period covered by the statement that the company did furnish you?

A. My impression is it was from 1887 or 1888 up to and including the year 1910.

Q. Was that in the form of a sheet made up showing the gross revenue for each year?

A. Yes, sir.

Q. Giving the years you mention. Now operating expenses, did you request information as to that item?

A. Yes, sir.

Q. And over what period of years?

A. For the past five years and as many years prior as they could give me.

Q. When the company furnished it, what period did it cover?

A. My recollection is that that particular statement under consideration covered from about 1887 or 1888 up to and including the year 1910.

Q. And was the information written upon a sheet showing annual operating expenses?

A. It was typewritten on a sheet.

Q. For each year?

A. Yes, for each year.

Q. You requested that item because you regarded it as not only important, but necessary in order to make up an intelligent judgment of the value of the property?

A. Yes, sir.

Q. Now taxes, what period did the information given you cover as to taxes, how many years?

1425 A. I believe the same period, that is from about 1887 or '8 up to the year 1910 inclusive.

Q. And was that information furnished to you in writing by the company?
A. Yes, sir.
Q. And why did you want that information?
A. For the same reason, that I wanted it in compiling portions of my report.
Q. In other words to make up an intelligent and safe estimate of the value of the property of the Des Moines Gas Co., you deemed it necessary to know what they had been paying in taxes in Des Moines?
A. Yes, sir.
Q. Covering a considerable period of the life of their plant?
A. I don't know, for at least five years.
Q. And that information was made up in typewritte- form the same as the other?
A. Yes, sir.
Q. I find here another item, net earnings 1887 to 1910. Did you request that information?
A. Yes, sir.
Q. Was it necessary for you to have that information from the company?
A. Yes, sir.
Q. After you had been furnished with the gross revenue and operating expenses and taxes?
A. Well I could have made the deductions of course myself, but while they were making up the statement I asked them to——
Q. Just as w-ll carry it to the limint and make it complete, that was your notion?
1426 A. Yes, sir.
Q. And I take it you regarded the item of net earnings as important and necessary to a proper valuation of the property?
A. Yes, sir.
Q. Now that item was furnished in the same way the others were furnished?
A. Yes, sir.
Q. And covering the period you state from 1887 to 1910?
A. Yes, sir.
Q. The last day of 1910?
A. Up to and including the year 1910?
Q. The next item you have here is gas sold from 1888 to 1910 Did you request that information from the company?
A. Yes, sir.
Q. And for the same reason as stated as to the other items?
A. Yes, sir.
Q. That item is necessary as to the amount of gas sold over a given period of years, is a necessary item in arriving at a valuation of the property.
A. Yes, sir.
Q. Now population of Des Moines for the years 1880, 1890, 1900 and 1910, was that information furnished by the company?
A. It was.
Q. To you?
A. To me, yes.

Q. In memorandum form?
A. Yes, sir.
Q. Did you request it?
A. I did.
1427 Q. And why?
A. For use in connection with my report.
Q. Did you regard that information as important and necessary in fixing a value upon the property of the Des Moines Gas Company plant?
A. I did.
Q. Schedule of manufacturing cost. Just what do you mean by that Mr. Baehr?
A. By that is meant the cost of coke and oil used in the manufacture of gas.
Q. I didn't give you all of the item, I guess it is schedule of manufacturing cost, quantities used and cost of same? That is all limited to the items of coal and oil is it?
A. It may include the coal used under boilers, but it does include coke used in the water gas generators and the oil used for making gas.
Q. What period of time did that schedule cover?
A. Some three or four years from 1910 backwards.
Q. There was set out in that schedule was there in the form of memorandum the quantity of coke and oil used by the Des Moines Gas Co., and the original cost of it.
A. Yes, sir.
Q. Did you ask for that information?
A. I did.
Q. And did you state the period for which you desired the information?
A. I believe I requested that the price of materials for the past three or four years would suffice for my purpose?
Q. Did you regard it as important and necessary to?
A. Yes, sir.
1428 Q. And it was furnished you as these other items have been by the Des Moines Gas Co.?
A. It was.
Q. Now the next thing you have here is statement of profits and loss for the years 1907, 1908, 1909 and 1910. Did you ask for that statement?
A. I don't recall whether I asked for that particular statement or not.
Q. Was it furnished to you by the company?
A. Yes, it was.
Q. Did you regard it as important in making up your valuations?
A. I am not so sure whether I requested that from the standpoint of regarding it as important or not.
Q. But you have it among your files?
A. Yes, sir.
Q. Just as it was furnished to you by the company?
A. Yes, sir.

Q. Now the next item is record of mains laid by sizes and years 1886 to 1910. Was that information furnished to you?

A. It was.

Q. Did you ask for it?

A. Yes, sir.

Q. To whom did you direct your request?

A. To Mr. Haines.

Q. On one of your early trips to Des Moines?

A. I think I must have asked for that very early in the proceeding.

Q. Why did you ask for that?

A. For the reason I needed the information in compiling portions of my report.

Q. Wouldn't it have served the same purpose if you had
1429 been simply furnished with the number of feet or miles of main in use by the Des Moines Gas Co.?

A. No, sir.

Q. It was absolutely necessary that that information be in detail as to the number of miles or feet of main laid each year, the size of the different pipes and the character of the pipe itself, is that right?

A. The character of the pipe itself I determined from conversation, but the other features you mention were necessary.

Q. However you determined it it was necessary that you know whether it was cast iron or steel or sheet iron or what ever might be used?

A. Yes, sir.

Q. Would you have been satisfied as an engineer to have made up and furnished an estimate of the value of this plant without this information from the company?

A. No, sir.

Q. And when did you first get it?

A. I began to get information on January 1st.

Q. Do you remember when you got this first as to mains?

A. No, sir; but I think that was probably along in February or March.

Q. About the time that you got the maps and distribution statement.

A. Yes, sir.

Q. Do you still have that memorandum?

A. Yes, sir.

Q. Did you get this information Mr. Baehr prior or subsequent to meeting at the Blackstone in Chicago?

A. I believe most of the information was secured subsequent to the first meeting at the Blackstone Hotel.

1430 Q. I suppose I am safe in saying that the same information with respect to mains was furnished the other engineers at the same time?

A. I can't say as to that.

Q. You don't know about the fact?

A. I don't know.

Q. You haven't talked that over with them to know whether they did in fact have that information or not which was furnished to you?

A. I did not.

Q. Now that memorandum will show first the number of miles or feet of mains laid by the Des Moines Gas Co.?

A. Yes, sir.

Q. Next it will show the size of each main?

A. Yes, sir.

Q. And the year in which that particular pipe was laid?

A. Yes, sir.

Q. Covering the period from 1888 to the 31st day of December 1910?

A. Yes, sir.

Q. Now in connection with that, did you have furnished to you or did you ask for the cost of the main?

A. I did.

Q. As you did the cost in other places here, and was that furnished?

A. There was a statement furnished to me of the cost of laying the mains, giving the details of labor and material for several years past.

Q. Was it a part of this same memorandum that had the number of miles of mains and sizes and so on?

1431. A. I believe not, I believe that was on a separate sheet.

Q. And that you have not in this list have you?

A. I believe I have. I believe I have included somewhere in that list the cost of mains and services.

Q. But anyway you don't think it was in this memorandum that we just now have under consideration?

A. No, sir; I believe it is on a separate sheet.

Q. You regarded this information I take it as highly important and necessary?

A. Yes, sir.

Q. And would not be satisfied to make up valuation upon any gas property or gas plant without that detailed information?

A. No, sir.

Q. Now number of governors, that I suppose was simply one of the details of the material or rather the apparatus or pipe used and that was furnished the same as all this other and at your request?

A. Yes, I asked for that information although I did not deem it as necessary perhaps as some other.

Q. Working capital December 31, 1910. Did you ask for that?

A. Yes, sir.

Q. And why?

A. In order to assist me in formulating my judgment for an allowance of working capital of the company.

Q. In using the term working capital, just what do you mean?

A. I mean the amount of money invested in stores and supplies and a certain amount of cash over and above that.

Q. In other words stock and material on ha-d not in use and whatever cash the company was carrying and using for discounting bills and that class of business.

1432 A. Together with a consj-eration of accounts payable and accounts receivable.

Q. That is to say if they had accounts payable on the 1st of January of $10,000 and accounts receivable of $30,000 both good you would call the difference part of the working capi-al?

A. Yes, sir.

Q. Which would be $20,000 in that item?

A. Yes, sir.

Q. You got that information for that one year, December 31, 1910?

A. Yes, sir.

Q. And when the information came to you it showed the material in stock *on* on hand, the stock as distinguished from material which would mean stoves and fixtures and that class of property and bills receivable and bills payable and cash in the drawer.

A. I think it showed accounts receivable and accounts payable in addition to the material and the cash.

Q. Instead of bills receivable and bills payable?

A. Yes, sir.

Q. Do you remember how much that was on December 31st?

A. Total of the working capital at that time?

Q. Yes. Total of these items you call working capital.

A. My impression is that statement shows statemen*d* in excess of $141,000.

Q. At any rate it was furnished to you by the company in a written memorandum of some kind and you used it in working out your report?

A. Yes, sir.

Q. The next item here is consumption of meters by dis-
1433 tricts. Do you remember just when the scheme of dividing the city into districts originated and who originated it?

A. According to the best of my recollection that was developed about the latter half of February.

Q. And was it your plan or somebody else's?

A. I believe that resulted as the result of a discussion concerning that exhibit.

Q. Among the engineers?

A. Among the engineers.

Q. It was finally determined that would be a good way to work out the proposition and you adopted it?

A. Yes, sir.

Q. Was that accomplished at this conference in Chicago, the second one at the Blackstone Hotel?

A. I believe we decided on a division of the city into districts while in Des Moines.

Q. Earlier than the meeting at the Blackstone?

A. My impression is that this was some time during the latter half of February.

Q. And after that had been worked out among the engineers and the other interested parties then the company furnished the information by districts?

A. Concerning meters yes.

Q. Yes, I mean concerning the consumption of meters, I suppose that means the gas measured by the consumers' meters?

A. Yes, sir.

Q. And nothing else?

A. That is it.

Q. Now in this item of consumption of meters by districts was that memorandum made up showing the number of meters
1434 and where *and where* they were in use or did it just give the number as *som* many and amount consumed as so much?

A. I believe that memorandum gives the number of meters in each district and there are some computations on it which result in final figures showing average consumption per meter in each district as distinguished between regular and prepayment meters.

Q. Do you know whether that includes the consumption of gas by the street lights?

A. No, sir; that refers entirely to the consumption of gas by consumers' meters as I understand it.

Q. In buildings and not by either street lights or any other outside illuminating scheme.

A. My recollection is that refers to meters only.

Q. Now that information you regarded as important and necessary.

A. I did.

Q. To an intelligent and safe valuation of the property did you?

A. Yes, sir.

Q. Now we have the item I guess that we were talking about a moment ag*i*, cost of laying mains and services. Did you request that information?

A. Yes, sir.

Q. Why?

A. I wanted to make a careful study of the cost of laying mains and services in Des Moines as the result of which study I could form my judgment upon which to base the reproduction value in my report.

Q. In other words, you deemed it as absolutely necessary to be informed as to the cost of all material and all labor about the gas plant in the city of Des Moines in order to determine what
1435 a gas plant in that city was worth?

A. Yes, sir.

Q. You would regard a valuation based upon information that left out the item of cost in Des Moines as of no value to any body?

A. Well I would not like to say that a valuation *l*ade without such consideration would be worthless.

Q. You would not recommend to one of your clients, if that is the right term to use, if you were going to advise for investment purposes you would not recommend action on a plant where no consideration had been given to the cost of the property in fixing value would you?

A. That might depend to some extent on *t*hat the information was to be used for.

Q. Well if it was information that was to be used for the pur-

pose of determining the value by people who knew nothing about the value of property at all, if they were trying to inform themselves?

A. There might be conceivable an approximate valuation which would serve some purpose.

Q. That is to say might guess at the value without having any definite information about it at all?

A. Some values need not be based on as detailed a study as I have made in this instance.

Q. But you regarded this item as one of the real important items upon which to base your judgment of valuation did you not?

A. Yes, sir.

Q. Now how many—I don't know whether you told in connection with the mains laid, but what period did the information
1436 showing the cost of laying mains and services cover?

A. I believe the past five years.

Q. And was that detailed information, that is did it show labor cost, the material cost and such overhead charges as might be necessary in the laying of mains and services?

A. As I recollect it the information was furnished in detail.

Q. And that was furnished by the Des Moines Gas Company in the form of written memoranda.

A. Yes, sir.

Q. Do you still have that.

A. Yes, sir.

Q. The next item here is cost of restoring paving and I believe that is one of the items of information that you did not accept just as it was furnished to you if I remember your statemen- *f*orrectly. Did you ask for the cost of restoring paving?

A. I asked for dat- on the cost of restoring various kind- of pavement in Des Moines.

Q. I suppose you did that because you recognized that the cost of that kind of work varied and was not the same in all localities?

A. I wanted to reinforce my judgment, to base my judgment upon a study of costs in Des Moines.

Q. It was in Des Moines of course, the property was in Des Moines you were fixing a value on?

A. Yes, sir.

Q. You wanted to know about the cost of that kind of work in Des Moines for the purpose of determining the value of taking up and repla*t*ing paving?

A. Yes, sir.

Q. You would not have thought it safe would you to have
1437 acted upon information about the cost of tearing up and replacing pavement in Wheeling for Des Moines would you?

A. I should have wanted detailed information of local conditions.

Q. Was this item furnished you by the gas company?

A. Yes, sir.

Q. In the form of memorandum?

A. The form of a copy of a letter.

Q. And that copy of a letter was a letter written to the gas company by somebody here in Des Moines?

A. Yes, sir.

Q. Do you remember who it was?

A. No, sir; I do not.

Q. Whose name was attached to it?

A. No, sir.

Q. Anyhow it was a letter purporting to detail the cost of tearing up and replacing a given amount of paving of the different kinds?

A. Yes, sir.

Q. That is to say on the memorandum was a statement as to what it would cost to tear up a piece of pavement so many feet wide and so many feet long where the paving was asphalt with concrete base and so much if it was brick pavement and so much if it was wood blocks and so much if it was this other kind of pavement, I have forgotten what they call it?

A. My impression is that the particular memorandum referred to or copy of the letter referred to indicated the cost per square yard, whether it gave dimensions of openings I don't recall.

Q. Well somewhere along *w*ither in your testimony or Mr. Lea's and I am not very sure which you indicate that you did not
1438 accept the company's statement as to the size of the openings?

A. I did not.

Q. That is you did not accept it?

A. No, sir.

Q. Now was it in this memorandum that they stated the size of the trench or opening that they furnished as a basis for the valuation on pavement?

A. No, this memorandum simply contained the cost of restoring paving. The sizes of the openings were determined from my own experience.

Q. They did however, furnish you some statement as to the size of the openings from their standpoint?

A. I don't -ecall that but I believe not.

Q. In this statement of the cost of repairing paving what other information if any was in it than just simply the statement of the cost given by somebody as to what it would cost to tear up and replace paving in Des Moines?

A. I believe there were some general statements as to the conditions under which the price named would hold.

Q. That is what I want if you can remember.

A. The only one which comes to my mind at the mo*n*ent is that—well I think more than one comes to my mind now. There was some specifications as to the material, the paving material which had been taken up, that it was not to be covered by dirt, excavated from the trench, and that in taking up brick pavement not more than a given percentage of the brick were to be destroyed or broken in taking out.

Q. Any other conditions?

A. That is all I recall at the mo*n*ent.

Q. Was there anything in the latter about the future care of the part of the paving that had been replaced?

1439 A. I don't believe there was.

Q. Or connecting it up with the balance of the paving?

A. My understanding of that information was that if a hole had been excavated through or cut through an existing paving and the paving was to be replaced that it was to be a good job and that the new paving was to connect on to the old and make a good piece of work or workmanlike job.

Q. Have you got the copy of the letter with you?

A. Yes, sir.

Q. If you will, just let me have that.

A. There is the letter.

Q. The letter you refer to uses some signs and marks I would like to ask about down in the specifications if that is a proper term, it begins with two course brick pitch filler width of trench 20 and what do the marks mean, does that mean 20 feet.

A. Twenty inches.

Q. And four with two points?

A. That means twenty inches.

Q. Width of trenches 20 inches, additional width of pavement 4 with two marks?

A. That is also inches.

Q. This letter you refer to is in the form of a proposal to the Des Moines Gas Co. on the part of the J. W. Turner Improvement Company to do certain work in tearing up and replacing pavements is that right?

A. Yes, sir.

Mr. BYERS: I will read it in the record so that we will have it.

1440 MAY 22, 1911.

Des Moines Gas Company, Des Moines, Iowa.

GENTLEMEN: We propose to furnish all tools, machinery, labor, and material necessary to relay pavement in a 20 inch trench, said trench to be excavated and backfilled by the Des Moines Gas Company to the sub grade of the pavement in place, for the following prices.

	Width of trench.	Additional width of pavement.	Per lineal foot.	Per square yard.
2 Course brick pitch filler.....	20″	4″	$.24	$1.05
Concrete base brick, cement filler.	20″	10″	.62	2.28
" " " Pitch " .	20″	4″	.36	1.75
" " " Sand " .	20″	4″	.28	1.37
" " " asphalt " .	20″	4″	.38	1.82
2 course " sand " .	20″	4″	.16	.72
Concrete base creosote block, pitch filler	20″	10″	.50	1.98

These prices are based on the condition that the men taking up the pavement will not cover concrete, brick, creosote blocks and

cushion sand which has been removed from the pavement with the excavated earth and will leave them convenient for replacing in the pavement. Also that in removing pavement with sand, pitch or asphalt filler, they will not destroy more than 10 per cent of the brick or creosote blocks.

Respectfully submitted,

J. W. TURNER IMPROVEMENT COMPANY,

By PAUL L. REILLY, *Secretary.*

1441 Q. Was that the information as to Des Moines upon which you at least partially based your judgment of the value of tearing up and replacing paving?

A. That was part of the information, yes. I used that for partially determining my judgment.

Q. Did you get any information from anybody else as to the cost of tearing up and replacing paving in Des Moines except that?

A. I discussed the question of paving costs with Mr. Vincent engineer of the Des Moines Gas Company and I am not sure from recollection whether the prices given by these contractors that I refer to Messrs. Mardis and Weitz have any data as to paving or not.

Q. They are not in the business of paving are they, either of them?

A. I don't recollect whether their lists furnished any paving items or not.

Q. At any rate this is the written information that was furnished to you by the Des Moines Gas Company upon the paving question?

A. It is.

Q. Now in this connection what you asked the company for was some information as to what the cost to the company had been for that kind of work wasn't it?

A. I didn't ask specifically for what you state.

Q. Did they ever furnish you information of that kind?

A. I had several talks with Mr. Vincent the engineer of the gas company and such information may have been included in these discussions I don't remember that.

Q. Now the next item here, an interesting one to me at least, a study of life and age and method of figuring, who furnished

1442 that?

A. Mr. Klumpp of the United Gas Improvement Co.

Q. Was it his work?

A. I am not sure of that.

Q. Do you have that paper with you?

A. Yes, sir.

Q. Did you request that?

A. I don't remember whether I requested that or not.

Q. Why was Mr. Klumpp furnishing it to you, what had he to do with it?

A. We had various discussions of the methods of de-ermining age, depreciation, etc., and Mr. Klumpp had made some studies of various methods of figuring these things and he gave me one of the copies or a copy of the work that he had done in that respect.

Q. Now right in that connection let me ask you if it is not the fact that in this conference the ones you had when counsel were present and some of these engineers we- present in February or whenev- the time was at Chicago and the one at the hotel there, Blackstone Hotel wasn't one of the questions that you were all discussing at these times was the true method that ought to be adopted in arriving at the value of property, wasn't that one of the things you were all discussing at the inception of this work?

A. We discussed a number of subjects and I am trying to refresh my memory just now as to whether we discussed the method of arriving at the value of the property or not. My impression is that we did not devote any discussion to the method of arriving at the value but we discussed features of the method.

1443 Q. Am I not safe in saying this that at these conferences when counsel and the engineers who were expected to fix a value and appear here in the trial of this case to support their reports, wasn't it a part of that discussion and wasn't that one of the things that you were trying to work out a concert of action on and that is the question just what items of value should be considered in arriving at a final estimate of the value of the whole property.

A. I believe there was a discussion of the varius items that entered into the value of the property.

Q. And I suppose it is true too that one of the things about which there was some difference of opinion among you at the beginning was as to whether or not all of the items that were finally included in the valuation or only a part of them were proper to be considered in a rate case.

—. I presume there was some discussion along these lines, yes.

Q. Would you as an engineer with the experience you have had in the business and with your knowledge of the gas business and its relation to the public and especially its relation to the public in Iowa would you make exactly the same valuation or rather would you adopt the same methods of arriving at the valuation and include the same items in the valuation in a case where the value was being fixed for the purpose of rate making that you would in a case where the value was being determined for bargain and sale?

A. I believe that I would make no difference in the value of the items that are contained for instance in my report in the Des Moines case, but there might be other considerations entering into the question of buying and selling which I might discuss.

1444 Q. In that connection isn't that exactly what you were doing in this conference, were discussing these propositions and trying to arrive at a concert of action on this question of valuation?

A. I believe we were duscussing all these featyres.

Q. Now when you said a study of life and age—first let me ask you what connection did you understand Mr. Klumpp had with this controversy?

A. I understand that Mr. Klumpp is an engineer in the employment of the United Gas Improvement Company of Philadelphia and I presume he is assigned to assist in this case on the part of the company.

Q. In other words you knew he was not an outside and disinterested party with respect to the valuation of this plant.

A. Yes, sir.

Q. You knew that his employment was with the owners of this plant?

A. Yes, sir.

Q. And how was it with respect to Mr. Heminger? Was that the same situation in his case?

A. Yes, the same situation is true in his case.

Q. Any of the other engineers occupy the same situation?

A. I believe Mr. Brodnax was in the employ if the United Gas Improvement Company early this year and prior thereto.

Q. Mr. Randolph, did he have any employment, that you know of?

A. Not that I know of.

Q. Was it determined there at the conference finally that Mr. Klumpp was to work out this study and furnish it to you gentlemen?

A. I don't believe that was determined at the conference because my first recollection of that study, I can't tell just when it
1445 was but I happened to see it one day and asked Mr. Klimpp what it was and he told me. I glanced through it and subsequently was given a copy of it.

Q. I suppose Mr. Lea and the rest of the engineers were given a copy too?

A. I am not sure of that. I don't know.

Q. The study of life and age, that meant life and age of the plant or the separate items of the property?

A. I believe that the studies contained in that statement of Mr. Klumpp's related to life and age of mains and meters and perhaps also the plant and plant apparatus.

Q. Did it purpose to be a study of the actual life or rather the life and age of property that was actually in existence or was it made up of estimates, etc.?

A. I believe it related to the Des Moines property in a general way, but I have not studied the same in detail so that I cannot say for sure on that point.

Q. Have you got it handy?

A. Yes, sir.

Q. I wish you would let me have it. The study you have handed me is a bound volume and on the inside front page the words Des Moines Valuation notes on depreciation with p. 31 no meters per year and the name W. A. Baehr on that page and the following pages from 1 to 56 inclusive.

Mr. GUERNSEY: It is hardly correct to call that a bound volume is it?

Mr. BYERS: Well perhaps not.

A. Yes, sir.

Q. And it has been marked by the reporter defendant's Exhibit 8?

A. Yes, sir.

1446 Q. The next item here Mr. Baehr is cost of meters. Was that information requested by you from the gas company?

A. It was.

Q. And was it furnished to you in the form of memorandum?

A. It was.

Q. And what was included in the memorandum as you remember it?

A. I don't remember what was included in that memorandum I would look at it to see.

Q. Do you have it handy?

A. It may be among these papers.

Q. If you will just take a second and see. Do you find it?

A. Yes, sir. It is the top statement on that sheet of paper.

Q. Mr. Baehr I wish you would read into the record or state into the record using the memorandum that was furnished you to refresh your recollection just what was furnished to you by the Des Moines Gas Company with respect to the cost of meters giving the information just as it was given to you?

A. The data is headed cost of new meters. Then there is a subhead period. Then March 1, 1906 to February 28, 1907 $25,746.76. March 1, 1907, to February 29, 1908, $12,137.37 March 1, 1908 to February 28, 1909, $5,798.54. March 1, 1909 to December 31, 1909, $12,263.41. January 1, 1910 to December 31, 1910, $13,089.36. Total meter account $69,028.44. Total meters purchased in above periods 7,034. Effective cost per meter $9.813.

Q. Do you know what was meant by the term effective cost?

A. I do not.

Q. Have you had that explained to you since you received that information?

A. I have not.

1447 Q. So you don't just know at this time even what they meant by that?

A. No, sir.

Q. What you got from it was that that was the actual expenditures for meters for tho-e years was it not?

A. The only thing that I got from that memorandum was that a certain meter account *shod* that many dollars per year. I discussed that with the engineer of the gas company and I subsequently secured other information verbally which I used in making my own costs.

Q. That information when it first came to you was in the form you have just read it?

A. Yes, sir.

Q. Indicating to your mind and that is the information that you got from it was that for the years stated there there had been expended actually for meters between March 1, 1906 and December 31, 1910, $69,028.44, the amount stated there?

A. The only information I got was that a certain meter account showed these figures and that is as far as my information went. I didn't ascertain——

Q. I know but you didn't suspect that didn't show the actual expenditure for meters did you?

A. All I know about — is what I said that it represents the expenditure of the meter account. That is as far as I went with it.

Q. What you asked for was the amount of money that was expended, paid out by the gas company for meters during these year-wasn't it

A. No I tried to secure a detailed statement of the cost of meters f. o. b. cars plus the cost of testing and handling, plus cost of connection and I didn't get that sort of a detailed statement.

1448 I got this statement. Then I subsequently had discussions about the meter proposition and finally formulated my own estimate.

Q. That don't quite clear up that situation for us. What did you understand when you got that that the item there from March 1, 1906, to the date the next year there, what that represented?

A. I presume it represents the cost of new meters in that period but I don't know that.

Q. That is what you took it to represent when you got it?

A. Yes, sir.

Q. Of course you don't know as to any of these things that appear in their records except as they state them to you?

A. That is it.

Q. Now you did request of the company did you not a statement of the amount paid out, may not have put it in just that form but you did request information as to the amount expended for meters covering a period of years?

A. My request was the cost of each size of meters f. o. b. Des Moines and not the total.

Q. They sent you what you have there?

A. Yes, sir.

Q. In requesting the cost f. o. b. of meters in Des Moines and I take that to mean delivered in Des Moines on cars you assumed it not only important but necessary to have that information in o-der to make up your general report here as to valuations of the light plant?

A. Yes, sir.

Q. And your whole scheme does depend upon the accuracy of the information that was furnished you all along the line as

1449 to the cost of the several articles does it not?

A. The information furnished me assisted me in forming my judgment of the cost of the property in Des Moines. Of course you understand that I have an idea of what the various kinds of things cost used in gas plant construction.

Q. But in this case you did not act on any idea about cost of other properties only as that might have aided when you had none locally?

A. I got all the information I could locally.

Q. The last item here is mains by districts number of feet and size. You had that in a separate memoranda did you from this?

A. Yes, sir.

Q. Did you request that?

A. Yes, sir.

Q. And just what is covered by the memoranda that was furnished you on that proposition?

A. Was that by districts?

Q. It says mains by districts number of feet and size.

A. That information comprised the number of feet of each kind of main in each district and the number of feet of each kind of main under each kind of pavement in each district.

Q. In other words it was a very complete statement covering all items that you have just mentioned.

A. It was.

COURT: Was that used otherwise than in the going value?

A. That was the principal purpose of it.

Q. In this last statement mains by district and number of feet and size it was necessary for you to have that in order to work out the plan or the method that you have adopted in arriving
1450 at valuation was it not?

A. Yes, sir.

Q. And that was the reason you asked it?

A. Yes, sir.

Q. Now I have noticed, at least I think I have, I don't know that I have been through your report carefully enough to be sure about it, but I see no place in the report where you have taken up the physical property by separate items and given the value by items. Your valuations are nearly altogether in totals are they not?

A. Yes, sir.

Q. In that respect you did not pursue the same method Mr. Lea did?

A. I am not at all familiar with Mr. Lea's report.

Q. You were here several days while he was explaining it you remember?

A. That is the only time I paid any attention to it. My method of figuring and my report is entirely different from Mr. Lea's.

Q. He took up, for instance, take the buildings, he started with clearing site and he allowed a certain amount for clearing site, then the next item was excavation and he allowed a certain amount for excavation and then the next item was probably foundation, if it was brick the number of brick and the cost of the brick in the wall which was carried out in his total of brick and then the frame work if there was any frame work, the number of feet of lumber and the price of that lumber I suppose as I remember it in the building and that was carried into his total. Now it is not possible for us to go through your report and ascertain just what you have used for your unit values is it?

1451 A. No, sir; those figures are not in the report.

Q. You I suppose, however, did work the valuation out from units.

A. Yes, sir.

Q. Then in that connection you get your information as to measurements, as to quantity, age of properties, perhaps better to say history from Mr. Brodnax' inventory?

A. Yes, I derived that information from the inventory of which a copy was furnished to me.

Q. In that inventory the separate items are carried through so that you had the items not only of apparatus, but of the material used in the building as to brick and all the quantities.

A. Yes, sir.

Q. So you have undertaken to value the mason work, cost of brick cost of excavations the cost of lumber in the wall or in the building and the cost of labor and all that sort of thing in Des Moines?

A. I have.

Q. Who did you consult if anybody with respect to what the cost of labor was in Des Moines?

A. I consulted the Des Moines Gas Company officials in Des Moines and I believe two contractors in Des Moines.

Q. The two you have already named?

A. Yes, sir.

Q. Did the Des Moines Gas Company furnish you any written memprandum showing the cost of labor in Des Moines?

A. I believe they did.

Q. What period of time was that memorandum confined to.

A. I understood that data to refer to conditions as of the time of this inventory or thereabouts.

1452 Q. It would be some time between the 1st day of January 1911, and the 1st day of July say, of the same year?

A. I would take the labor condition, the labor prices to refer to a building season.

Q. Well is that a building season I have just mentioned?

A. I would consider a building season from the opening of building work in the spring until towards the winter.

Q. Well of course then it must have covered a period sometime in the past?

A. That was my impression, yes.

Q. Probably what they paid for labor last year?

A. That was my impression.

Q. In other words, you didn't take a period of years and get the average cost of labor, that is not the way you proceeded?

A. Not on the labor, no I didn't.

Q. You undertook to fix the cost of labor for the building season of 1910?

A. Well I would extend that a little further and say it was the approximate price—that it was the price of labor for the entire year 1910 and p-esumably extending into the year 1911?

Q. How did you get at the cost of excavating?

A. Excavation?

Q. Yes?

A. The cost of excavation was stated by contractors to be so and so much for different kinds of excavation.

Q. So all your valuation then and estimates as to the co-t of excavation in Des Moines rests upon statements of these two contractors made to you through the gas company?

A. No. After having obtained these statements I studied them

very carefully and derived figures which in my experience
1453 would be satisfactory for that kind of work. I didn't accept the cost of work as given to me by these contractors without studying them and without using my experience on which to base a unit cost.

Q. You would not want to add anything to the value of this plant by refusing to take what it costs in Des Moines to do work would you?

A. I would certainly not want to do anything that was not fair and right.

Q. That is not just an answer. Isn't it true Mr. Baehr that if upon investigation you found that the cost of excavation in Des Moines was less than it was at these other places where you had experience in fixing value upon property in Des Moines wouldn't you accept that rather than the higher figures that your experience had convinced was in vogue in other places?

A. I would certainly pay attention to is and would certainly not figure the excavation as high as in other places where the costs were a great deal higher.

Q. Well wouldn't you take it exactly at the price it could be done for here, wouldn't that be the value of it?

A. Take practically that but I have included in my excavation the cost of hauling.

Q. Take the excavation right south of Elm street, you know where Elm street is, that cuts through the Gas company's property and divide it and leaves two storage tanks of some kind, I don't know just what they are.

A. Yes, sir.

Q. South of Elm street. There was quite a large job of excavation for these two tanks the dirt just simply hauled up in a
1454 big pile. What do you allow for that kind of excavation do you remember?

A. I can't tell you without looking up the exact figure, but I took my excavation and determined what in my mind would be the method of excavating, I had from these contractors the cost of doing excavating by various methods and I based my judgment of the cost of doing excavation by each kind of method on these figures.

Q. But there is no way is there we can take your report and ascertain just what you allowed upon certain parts of this work for excavating?

A. The report does not show that in detail.

Q. Let me put this question to you, if it should turn out that a dozen reliable persons would appear here and testify in this case that that kind of excavation the usual and ordinary charge for it was from 15 to 18 cents would you then think that the allowance in here of from 60 cents to $1.30 would be fair?

A. If the contractors had included in it in their estimates just exactly what I have included in mine and if my figure should be obviously wrong that way, I would admit it is wrong.

Q. You have used a sort of comparative method of getting at *at*

value you don't want the Master to understand that you pay no attention to actual conditions here do you?

A. No, sir.

Q. That is to say while you have treated and worked out what you regard as a fair valuation now of the plant buildings, as you call them, and in that valuation of course is included a large amount of excavations and common every day labor. You don't mean do you that your valuation was made without regard to the
1455 conditions down there and this kind of excavation that was actually done do you?

A. No, sir, I take into cognizance the conditions as they are in Des Moines and of the cost.

Q. Take that place I told you about where all in the world they had to do to make the excavation was to hitch a team of horses to a scraper and go into that soft dirt and scrape it up into piles, is it — your judgment and is that the figure you have used from 60 cents to $1.30 a yard for that work would be reasonable?

A. I don't remember what figure I used, but whatever figure for excavation I did use was my judgment of the reasonable price of that kind of work.

Q. Have you a memorandum handy so you can just at one glance see excavations?

A. Yes, sir.

Q. I would like to know the range of your allowance for excavation?

A. Well referring to the principal excavation for building No. 1 A and B, including hauling, I have figured $1.00 per cubic yard.

Q. You arrived at that valuation on the theory I suppose that it would be necessary to pay for not only taking dirt out but hauling it away?

A. Yes, sir.

Q. Off the premises?

A. Yes, sir.

Q. But how about when you don't take it off the premises at all but left it there to fill up sink holes around in the lot, used
1456 it for filling?

A. The figure for excavation which I have used in this instance is based on excavation and hauling and is my judgment of the reasonable price for that kind of work in excavations not exceeding 8 feet in depth. Now to answer your question specifically if excavated earth could simply be taken out by a scraper the cost would be less.

Q. Is a dollar the lowest figure you have allowed?

A. I don't remember, I would have to go through my detailed statements all the way through. But in my notes I find that I have the cost of excavation as ordinary cellars by barrow that is wheelbarrow, $1.00 per cubic yard. Ordinary cellars by scraper 35 cents a cubic yard, then the cost of a quarter mile haul on excavation of ordinary cellars at a total of 55 cents per cubic yard. This is all ordinary cellars.

Q. Now that is a sort of arbitrary valuation or cost fixed by you without any reference to the use of the dirt or value of it after it is taken out. That is to say these figures are what the work of taking out of the cellar or the place where the excavation is being made and hauling it away without reference to its use.

A. I have included in that a fair contractor's profit and take the figure as the reasonable average price for doing that kind of work per cubic yard.

Q. Does it make any difference what kind of soil you have to work in?

A. Oh yes if there were rock it would cost a great deal more. I assume no rock excavation at the plant.

Q. You assume the ordinary clay or sand sub soil?

1457 A. I have assumed the average soil or clay.

Q. No rock, no blasting, nothing of that kind.

A. No, sir.

Q. Did you make any inquiry here of men that were in that business to find out what they were charging for doing work every day right along?

A. I determined from local contractors what they considered a fair price for doing that kind of work.

Q. I know, but those contractors were getting that kind of work done. Did you inquire of anybody that was actually doing work themselves?

A. I don't know as I can answer whether these men were actually doing that kind of work themselves or not. I don't know them well enough for that.

Q. As I understand it, you didn't talk with them at all, but the company furnished you their statement.

A. I don't think I made my point quite clear. I was here a considerable length of time and I also had one of my assistant engineers here for a period of time which was as long or longer than the total time I spent here. He also made considerable inquiries as to the cost and reported to me and in connection with the memorandum of the cost of doing work copies of which were handed to me by the gas company, I determined what in my judgment was the fair cost for doing that class of work.

Q. Aside from those two contractors did any other disinterested party here in Des Moines give you any information about the actual cost of excavations such as the gas company were compelled to make when they built their plant?

A. No.

Q. Now take the question of brick, laying brick, do you

1458 know how you got at the value of the brick in the wall?

A. Yes, sir. We made inquiries, that is I am referring now to my assistant engineer and myself, of the cost of brick delivered in Des Moines and we found for instance that after discussing this with brick contractors, one was the Flint Brick Co., and also the Capital City Brick Co., that common brick that they would deliver common brick and considered a fair price for same delivered to be $9.00 per thousand. From that I made an analysis of the cost

of laying the actual thousand feet of brick in walls and foundations with using different kinds of mortar and in order to determine the cost of mortar I made a careful inquiry of the cost of cement delivered in Des Moines and the cost of sand delivered in Des Moines and I also ascertained the cost of labor in Des Moines.

Q. That is you mean you inquired about it and got information about it?

A. Yes, I got information as to the cost of labor in Des Moines. Then I added to the cost of the thousand brick and the cost of mortar sufficient for one thousand brick and the cost of labor for one thousand brick and added thereto fifteen per cent contractor's profit which gave me the cost per thousand brick laid and then I worked out the same sort of a tabulation for the different kinds of mortar, for instance I worked out one tabulation using cement mortar and followed the same lines and got an estimate of the cost of laying brick using lime and cement mortar and also an estimate of the cost of laying a thousand brick in lime mortar. That is the way I arrived for instance at the cost of brick.

Q. What did you finally figure in your estimate as the cost of a thousand brick in the walls?

1459 A. That depended on the kind of mortar used. If laid in cement mortar I figured $18.22 per actual thousand of brick.

Q. Did you make any investigation to see what kind of mortar had been used down there?

A. Yes, sir. That is covered in the inventory.

Q. That was lime wasn't it?

A. There was some lime and later there was some lime and cement and some cement mortar but in order to be sure in each instance I would have to look at each building.

Q. If there was any cement at all it was in the newest building or very late one?

A. I would have to look that up to get at the fact.

Q. Give us the value you finally arrived at?

A. This particular price I am giving you now is the cost of laying one thousand brick in foundations and bulk work with 15 per cent contractor's profit. If in cement mortar under these conditions I estimate $18.22 per thousand of actual brick.

Q. You inquired of the Flint Brick Co., and Capital City Brick & Tile Co.

A. I just have it the Capital City Brick Co.

Q. All right the Capital City Brick Co. Now you take brick being made by the Capital City Brick Co., and the other company that you say you inquired of and lay a thousand of them in a wall, is there any wall down there in any of the buildings of the Des Moines Gas Company's plant that would be like that thousand brick wall?

A. I don't believe I understand that question.

Q. The question is this, the buildings that the Des Moines Gas plant is occupying were built out of certain kinds of brick.

A. Yes, sir.

1460 Q. And laid in lime mortar or cement. Now did you ascertain or try to find out whether that brick that these people would furnish at $9.00 a thousand was the kind of brick that was in these walls?

A. That is what I understood from inquiry.

Q. Who told you it was?

A. I went down and inspected the brick, also discussed that with the gas company, also discussed with the brick people and they stated to me that the usual brick used in walls was worth $9.00 per thousand.

Q. That is the usual brick used in walls nowadays?

A. Yes.

Q. Was $9.00 a thousand but the brick in these walls are not the usual brick that are being used these days are they?

A. There are some brick that are much better than common brick.

Q. Yes, some brick are better that is true, but most of them are poorer and most of them differ from any brick made in this market now, are they not?

A. I think that is not quite true Mr. Byers. I think that the brick in the generator house and the brick in the building occupied by the blowers and the two 8 foot 6 condensers, and the boilers is a very good grade of brick and better than the common brick.

Q. These buildings are of recent construction?

A. The generator house or extension at least of the generator house of comparatively recent construction.

Q. What is the size of the brick in the old building, building built thirty five years ago?

A. I can't tell you what the dimensions of the brick are.

Q. And the one that was built 19 years ago, did you pay any attention to the size of the brick.

1461 A. No, sir; because the brick made by different people varies somewhat in size.

Q. All of that old brick down there are practically every brick that was used in these buildings prior to 1900 are common soft brick ain't they, that is except the trimming?

A. There are some buildings there made out of common brick.

Q. And all of them built prior to 1900 built out of common soft brick aren't they?

A. I would not *to* commit myself as to the date.

Q. All of the old ones anyway?

A. I presume the old ones are built out of common brick.

Q. The figures you have there are $18 for lime?

A. For lime mortar and common brick laid in foundation and bulk work including 15 per cent contractor's profit $16.95.

Q. How much laid in c-ment?

A. Laid in cement in foundations and bulk work, $18.22.

Q. In these other items of excavation did you allow contractor's profit too?

A. I allowed a contractor's profit in excavation, that is excavation at the plant, not excavation in the distribution system.

Q. Is that about fifteen per cent?

A. In that estimate a contractor's profit is used at fifteen per cent.

Q. That is to say if there was 10,000 cubic yards of excavation you would ascertain by your method the value of the digging hauling away of the dirt and then to that give a contractor's profit of 15 per cent?

A. In the excavation as nearly as I could get it I estimate that the contractor's profit is about 15 per cent. It is very diffi-
1462 cult to tell just exactly what it is, might be 12 per cent, might be 15 or 16 per cent.

Q. That would be a matter of estimate unless you had the contract at so much and knew just what the profit was?

A. Yes, sir.

COURT: You did not give the cost of lime and cement mortar?

A. If in lime and cement mortar common brick in coundation and bulk work $18.28 per actual thousand of brick.

Q. Do you mean in actual brick in the walls or do you mean in actual brick furnished for the walls?

A. My estimate is based on actual brick in the walls.

Q. And what consideration if any do you give for bats and broken brick, anything?

A. If there were any great amount of those that would go in as a portion of the profit which I have shown here in contractor's profit.

Q. That is the way you would cover it would be the contractor's profit?

A. Yes, sir.

Q. You have already told us all of your information about brick and cost of labor and all that sore of thing as far as Des Moines is concerned was by information from the company or from these two contractors and your own helper whatever he found about it?

A. Also our inquiries directly from the manufacturers.

Q. Now how about lumber, how did you get at your valuation of lumber?

A. In order to find out what fair prices for lumber were in Des Moines, we consulted Reese Gabriel & Co., and we obtained from fair prices delivered on various kinds of lumber. When I have
1463 figured a carpenter's job I have taken consideration of the amount of lumber that it was necessary to use to take care of overlapping and to take care of the fact that lumber comes in even lengths. For the carpenter labor and nails I based that at a certain number of dollars per thousand depending on the kind of work and in lumber work I have estimated a 15 per cent profit.

Q. The same as you did in the brick work?

A. Yes, sir.

Q. In other words where the invoice as made by Mr. Brodnax would show 10,00- feet of common lumber in some bulidings you dertermined what you thought would be the reasonable value of 10,000 feet of common lumber in the building with a 15 per cent contractor's profit added.

A. Yes, sir.

Q. And you got your information largely from Reese Gabriel about lumber?

A. About the co-t of lumber itself and also added to my information by the figures given by the contractors which we have named.

Q. The two men you have named?

A. Yes, sir.

Q. So that all of your figures with respect to lumber and brick and excavation is based so far as Des Moines is concerned anyway on what somebody else told you is it?

A. Well I was obliged to accept the statement of manufacturers as to what they would sell lumber for and with that statement I believe I would answer yes.

Q. Now I suppose you had nothing to do with the invoice itself so as to be able to say anything about its accuracy as to either number or quantity or quality or anything of that kind?

1464 A. I made a very careful check of the dimensions, but I did not calculate the quantities of brick but accepted the inventory in that respect.

Q. As being accurate?

A. Yes, sir.

Q. Did you measure the thickness of the walls in the building?

A. I did.

Q. You checked to that extent?

A. We checked one building through entirely, that is calculated everything that was shown in the inventory, possibly in two buildings but one I know of at the moment and we found that the quantities in that case were substantially correct.

Q. You had several men at work here did you not, Mr. Baehr?

A. I had only one assistant with me in Des Moines, but several men of mine subsequently helped me in the figuring of this work in Chicago, although I determined all the unit prices.

Q. You checked up all apparatus down there?

A. Yes, sir.

Q. So you are pretty well satisfied that we have not left out any holders or generators or anything of that kind?

A. I don't think there has been anything of that sort omitted.

Q. In a general way you checked up this invoice so as to satisfy your own conscience anyway if I may use that term that you were putting a value on the plant about as it really existed didn't you?

A. I believe I have a fair value on the plant.

Q. As it really exists? Now just a minute about the pipes and what you call the specials. How did you get at your values of these articles?

A. Take in the first place main pipe. I obtained from the

1465 Des Moines Gas Co., a statement which has been mentioned before this afternoon of all the purchase of cast iron pipe by the Des Moines company since 1906 and from that statement I determined a weighted average price paid for cast iron pipe by the Des Moines Company since that time and made up two tabulations giveng that information and after having determined the weighted

average I determined from that what would be a fair price to use for main pipe in Des Moines and that price that I took was somewhat less than the actual weighted average of the purchases of the company since 1906. The cast iron pipe market has been low recently, rather low.

Q. It is very low now isn't it?

A. It is very low just at the time being, but I took a price that I thought would be fair under the circumstances based partly on—well I might say largely on the weighted average of the actual price paid by this company in these years.

Q. Right there Mr. Maehr you took a period over which you say you traversed in arriving at your weighted average. Two or three years of that time this pipe was exceedingly high wasn't it?

A. The price per ton varied considerably. The statement that the Des Moines Company gave me contains the dates on which they purchased the pipe and now for instance the cost of pipe in my first tabulation f. o. b. cars per ton run from $26.15 up to as high as $36.00 per ton.

Q. Is that the highest point that was reacher in 1908 was it?

A. I can't tell without referring to the memorandum that the company furnished me. I have not the dates in my notes.

Q. You still have the memorandum that was furnished?

A. Yes, sir.

1466 Q. All right.

A. Now the weighted average price per ton of all cast iron pipe bought f. o. b. cars Des Moines, including the four inch pipe was $31.22, excluding 4 inch pipe $30.55 per ton. That is considering only the six inch pipe, the corresponding price was $30.55. In considering the price I take into consideration also of the state of the pipe market and try to arrive at what in my judgment is a fair price to use to apply to the enti-e main pipe owned by the company and in use. The prices I took were for four inch $29.50 per ton, f. o. b. cars and for six inch $28.50 f. o. b. cars. To this there was added the cost of carrying pipe to where it was used.

Q. How much was that a ton, the cartage?

A. $2.00. And the store room expense which in the case of this company and from the memorandum submitted to me by the company was 5.96 per cent.

Q. The sto-age charges?

A. Yes, sir.

Q. That was what per cent?

A. 5.96.

Q. Figured on what?

A. On cost of the material.

Q. Including cartage?

A. Not including cartage in main pipe. In the cost of cast iron pipe I have added store room expense to the co-t of pipe f. o. b. cars per ton and then added the cartage.

Q. This $2.00 cartage, what was that for, just what cartage from the train to storage?

A. Some cast iron pipe are delivered directly from the cars to the

job, that is it is hauled directly from the cars to the street
1467 where it is laid.

Q. That is true of all large pipe?

A. That is usually true of large pipe. Smaller pipe may be put in the yard for a long time and then hauled out or for a short time so that there may be at times the cost of two hauls in some of the pipe.

Q. You allowed $2.00 for the cartage whether it is two hauls or one?

A. Yes, as an average price.

Q. And this five and a fraction per centage for storage where did you get that?

A. All the material passing through the store account of the gas company last year received a store room expense addition of 5.96 per cent which is the cost or the amount of money necessary to cover sto-e room expense or cost of car-ing and records of stock.

COURT: Is that including freight?

A. I have based my prices on f. o. b. Des Moines.

Q. You have allo-ed and added into the value of all of the pipe that storage charge of five and a fraction per cent?

A. Yes, sir.

Q. Whether it ever passed through the storage place or not.

A. I considered that was a fair reasonable charge to add to the pipe.

Q. This gas company, do you mean that they charge up as part of the cost of all their pipe that storage of 5.96 per cent and you adopted their charge?

A. I adopt their charge just how they treat that on their books I don't know.

Q. But anyhow whatever they told you, they did tell you
1468 that was a charge of 5 and a fraction and you have just adopted that and charged to the cost of the pipe?

A. Yes, sir.

Q. Wasn't that rather a new and novel thing to you?

A. No, sir. That is a usual thing in gas plants. In fact that is the practice in all gas companies with which I have been connected. They all keep a store room and the cost of running the store room was distributed over the cost of the material that passed through the store room.

Q. Then it is not storage at all, the item is as you figured out there is the cost of operating the headquarters or office a portion of it that should properly be charged to pipe, that is what you mean is it?

A. It is the cost of taking care of material and keeping track of it and is part of the cost of the material.

Q. Do you mean that there is some separate service performed by somebody in connection with the gas company for that item other tha- the general service around the office?

A. Yes, sir.

Q. What is it?

A. I can explain that best perhaps by stating in the cases where -- have bee- connected the store room department was a very large department, for instance at St. Louis there was a store keeper and a

great many assistants and there was telephone and stationary and coal for heating, gas, used for lighting the building, a great many charges connected with that which had to be absorbed.

Q. I think I get a better understanding of the item than I had before. I got the impression in the beginning it was for storage as distinguished from store expenses.

1469 A. It might be my wording is unfortunate.

Q. No it was not your fault, it was my own. Now as I understand that it is the proportion of the expense of operating the business at headquarters to handle this material and store it if it has to be sto-ed that is charged up to pipe and that amounts to five and a fraction per cent?

A. That is what it amounts to in a case of this kind.

Q. And that you have added to the cost of the pipe?

A. Yes, sir.

Q. Now I suppose of course that is one of the items that is charged into operating expenses too?

A. Well if the material which comes o-t of the store room is used in operation it would go to operation. That is that part of it and if other material went to construction account that proportion of the sto-e room expenses would go to construction account.

Q. The larger pipe, sixteen, 20 and 24 inch pipe, invariably goes right to the field doesn't it?

A. It would usually go that way, that would be the most economic way to handle it. It might be necessary to store it for special work.

Q. And that would also be true of the 12 inch pipe wouldn't it?

A. Not necessarily although in laying pipe people naturally buy requesting deliveries when they are ready to lay it or just prior thereto and they avoid if possible a second haul.

Q. What were your unit values or prices of the larger mains above the 6 and 4 inch?

A. I used for six inch and larger, $28.50 per ton f. o. b. cars Des Moines. For the 6 inch cast iron pipe and larger sizes up to

1470 and including the largest, a price of $28.50 a ton f. o. b. cars, Des Moines.

Q. Right at that point, do you know what the price of that pipe is toda- delivered in Des Moines?

A. I don't know what the price is in Des Moines, but I have kept track in a general way of the price in Chicago.

Q. Well there would be but little difference between the price in Chicago and price in Des Moines?

A. There ought to be, the price ought to be more here and is more here.

Q. What was the price in Chicago say on the 1st of January this year 1911?

A. For gas pipe the price in Chicago ran from $23 to $24.50 per ton.

Q. January 1, 1911?

A. January 1, 1911.

Q. And it is considerably less now isn't it?

A. I think prices now, I have not seen quotations for some four or

five weeks, I think at the time I last saw them the prices were from $22 or $22.50 a ton to about $24 per ton.

Q. Now if you will, go on with the other units there.

COURT: January 1, 1911, you say $23 and $24 for the large ones?

A. That is the price in Chicago.

Q. What would be the difference or what was the difference at any time you have knowledge of the quotations of that kind of pipe in Chicago and in Des Moines?

A. I have not that knowledge because I obtained my knowledge of local prices from the records of prices paid by the gas company.

Q. Well how did that compare with Chicago prices.

1471 A. I should jugde there would be a difference of about a $1.50 or $2. per ton perhaps.

Q. Now to close up the day I want to go to another question if you will take youe Exhibit 21 I wish you would give me the total amount and it will help me if you make a memorandum o- the items as we go along, the total amount of item No. 1 as you have consid-red it and estimated as an item of ccost?

A. The tota- amount of item No. 1 I would have to figure for you on the reproduction cost new because I have not got that separate in my report.

Q. It would be a little more wouldn't it, reproducyion cost new.

A. That would be more yes.

Q. Well give it to me the -ay you have it, the way you can get it the quickets. That is what you call legal and organization?

A. No, sir; No. 1 is contingency. I have got contingency figured out separately on present value or depreciative value and the total of that item is $180,887.

Q. What is item No. 2 the added cost?

A. Item No. 2 is engineer and superintendents.

Q. Now give me the amount of that?

A. The amount of that based on present value meaning by that as of January 1, 1911, is $102,484.

Q. Now if you will give me item No. 3, what is it?

A. Item No. 3 is legal and organization and the amount based on present value is $80,581.

Q. I have that $90,244. I wonder how I got that?

A. You must have got that on the basis of reproduction new.

Q. Now item No. 4.

A. Item No. 4 is taxes. Total amount of that added to the capital account pr-sent value $49,709.

1472 Q. Item No. 5?

A. Interest during construction present value total $133,191

Q. Item No. 6.

A. That is all.

Q. Well the amount of your going capital then we will call it item No. 6, I am getting at the added costs.

A. The going value is estimated at $509,795.

Q. Now working capital?

A. Working capital $150,000.

Q. Now the paving?

A. If it will be of any s-r-ice to you you may have this table itemising that.

Q. That will be of service to me but I will finish the examination as I started. The amount now of paving?

A. This is reduced to present value and the base figure using present value paving over mains $259,851, all present value.

Q. That is only paving over mains?

A. Yes, sir.

Q. I wanted the total of that, paving over mains and services both?

A. I have them separate. The additional item paving over services present value base figure $22,384.

Q. Is there anything else in the way of added costs there I mean over and above as counsel said the other day, the value of the bare bones?

A. I have got figures here real estate, buildings, contents of buildings, outside apparatus, general office and stable equipment, street mains, paving over mains, services, paving over services, meters in use, meters in stock, distribution tools.

Q. These figures will answer my purpose for the time being. Now your total as it appears there in your report total present value of the property $3,221,166. And what do these other items total you just gave me, the tota- engineering, legal and organization, taxes, interest, going value, capital and paving?

1473

A. You want working capital included?

Q. I do want it.

A. The total present value of the items No. 1, 2 and 3, taxes, interest during construction, working capital and going value is $1,488,872.

COURT: There is just one question I want to ask you, this $3,221,166 is construction cost?

A. No, sir; that is the present depreciative value.

Q. Did you leave out the paving?

A. That includes the paving, that $1,488,782 includes base figure present value paving over mains and paving over services. The present depreciative value of the tota- property I p-ace at $3,221,166, and the items Mr. Byers was asking me to total up are included in that figure I have just named.

Q. Then if I understand Mr. Baehr, and it is important for me to have these figures now because of the manner in which your report is made up, if I understand your testimony the present value that you find of the Des Moines Gas Co.'s property, aside from these nine items of contingency and engineering, legal and organization, taxes, interest, going value working capital and paving is $1,732,294?

A. I make it $1,732,294.

Here the further hearing was adjourned until 9:30 A. M. tomorrow.

1474 Wednesday Morning Session.

AUGUST 2, 1911, at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of complainant resumed as follows:

WILLIAM A. BAEHR, re-called for further cross examination, examined by Mr. Byers, testified as follows:

Q. Mr. Baehr, the last thing that went into the record last night was the figures that were made up from which a balance was found of $1,732,294 which represents your valuation of the property, less the nine items that were given to me. Now I desire to know whether in that $1,732,294 is included the fifteen per cent that was allowed as contractors' profit?

A. All the base figures of present value are calculated from the reproduction new value and where I have used the contractors' profit of fifteen per cent in the reproduction new value the same has been depreciated and is found in the base figures of the present value.

Q. The $1,732,294 is the present value of the property less the nine items that you gave me, which items were contingencies, engineering and superintendence, legal and organization, taxes, interest, going value, working capital and two items of paving, making nine altogether; that represents the present value less these items as I understand you?

A. I would not want to say just what it represents without going over each item. The figures which you have mentioned are all figures based on present value.

Q. Let me put it in another way, Mr. Baehr. There is no fifteen per cent allowance or addition to the first item, contingencies,
1475 $180,877?

A. There is not.

Q. There is no fifteen per cent allowance for additions in the item engineering and superintendence, $102,484?

A. No, sir.

Q. Nor in legal and organization?

A. No.

Q. Nor in taxes?

A. No.

Q. Nor in interest?

A. No.

Q. Nor in going value?

A. No.

Q. Nor in capital?

A. No.

Q. Nor in paving?

A. There is no fifteen percent in the figures on paving; what profit there is in the paving for the contractors, I don't know.

Q. I understand that, but what I am trying to get at, if you can give it to me without too much trouble, is the present value, the total present value of the property in which there is an allowance of this fifteen per cent; I want to get that item, if I can, in figures.

A. In order to do that I would be obliged to go through my entire detailed estimate and determine each of the items in which I have made an allowance of fifteen per cent. For instance, brick work is based on fifteen per cent contractors' profit; lumber work, there is a contractors' profit estimated and in steel work; but there is no contractors' profit estimated in the distribution system, that is, in the mains and services or the meters and not in portions
1476 of the plant, certain portions which I figured the Company would do itself, and that fifteen per cent profit where it has been allowed is used in the reproduction new figures and the present or depreciated value; in order to arrive at that the percentage condition is applied to the reproduction new value which contains fifteen per cent contractors' profit where I have used it.

The MASTER: It is included in works equipment or machinery?

A. In machinery which is estimated as being purchased and erected by contractors there is a contractors' profit and there are certain portions of the plant that I estimated the gas company would perform the work itself and in such cases I estimated no contractors' profit; that is all based on reproduction new.

Q. Will you tell me just where in Exhibit 21 I can find the details with respect to the numerous buildings?

A. On page 76.

Q. Now on page 76 you show the buildings to be of the total value—are they all on that page?

A. They are carried forward to page 77.

Q. I notice pages 76 and 77, your total value after adding the items 1, 2, and 3 and taxes and interest, you make buildings worth $86,924 and your base figures are $67,607. Now to which figure did you add the fifteen per cent, if to either?

A. The fifteen per cent contractors' profit, where I have used it, is included in the details of the buildings. For instance, the brick work and lumber work, that could not be deducted from this exhibit.

Q. Well, let me put the question this way: Every part of the building was figured by you on the basis of erection by con-
1477 tractors, was it not?

A. In order to know that I would have to look through each detail.

Q. That is your general recollection of it?

A. I figured that the buildings would be put up by contractors, but I wish to refresh my memory before——

Q. I wish you would do that.

A. I estimated fifteen per cent contractors' profit in brick work; no contractors' profit in clearing site and staking out; in cement work there is undoubtedly a profit, but I don't know whether it is fifteen per cent or not. The estimated prices that are used are the market prices and I can't tell you the percentage of profit in some of them.

Q. These statements that you are making now, are you getting them from your report?

A. I am getting it from some memoranda I have.

Q. We couldn't take the report and get these facts you are now stating?

A. No, sir.

Q. Well, let me put the question this way, Mr. Baehr: Whatever of contractors' profit you did allow will be found in what you term base figures; it is in there and makes up a part of the figures wherever it was allowed?

A. Yes, on the basis of reproduction new and does not apply to the whole of the base figures necessarily. In other words, there are certain portions of the work on which no contractors' profit was figured.

Q. Well what else is there in the base figures except the value of reproduction new—nothing else in there, is there?

A. I have got some figures, I have got base figures as of present or depreciated value.

1478 —. Yes, I know; but the base figures as they appear here in your report all represent reproduction new, do they not?

A. They represent just what I stated at the top of each page and I find that is reproduction new in each instance.

Q. Why do you think it is necessary to take that precaution.

A. I believe it is reproduction new.

Q. You made these figures yourself, didn't you?

A. Made most of them, yes, sir.

Q. And I suppose you supervised the preparation of this report?

A. I did.

Q. So that you are quite familiar with not only the completed report, but also the detailed information that was used and from which the report was made?

A. Yes.

Q. All I am trying to get at is to get for my own use and the use of the Master—as far as he may want to use it—information from you as to just where, in a general way now, that fifteen per cent is added.

A. The buildings contain fifteen per cent profit, except in certain parts, but inasmuch as the buildings are composed of brick mostly, all brick, concrete, lumber, roofing, the greatest part of the base figure of reproduction new building cost in my report will contain fifteen per cent profit.

Q. Well, now, if we should want to determine the accuracy of your figures and the propriety or necessity, in order to arrive at a fair valuation of including or adding this fifteen per cent to any particular part of this property, we couldn't do it, could we, from your report? There would be no way that we could check you up on that, would there?

A. I believe in order to be accurate it would be necessary

1479 to go through each item.

Q. And have your detailed memoranda?

A. I think I could tell you such portions of the work in which I did allow a fifteen per cent contractors' profit.

Q. But to do that you would have to refer to your memoranda that is not set out in this report?

A. Yes.

The MASTER: If you divided by 1.15 at these places you allowed it would give you the net result?

A. Yes, sir.

The MASTER: And that is the amount without the contractors' profit?

A. Yes.

Q. That is, if we knew just what figures you had included it in here we could arrive at it by dividing 1.15?

A. Yes, sir; but you must understand that certain apparatus like purifiers, water gas sets, the boilers, I don't know whether the percentage of profit on them is exactly fifteen per cent.

Q. You don't know whether that is exactly what you included in your figures or not?

A. The question under consideration is manufacturer's cost and that is a difficult thing to get at.

Q. Anyway, it wouldn't be proper for us to multiply by fifteen per cent, or rather take fifteen per cent of these total figures and call that what you allowed for contractor's profit?

A. It would not.

Q. Now, take your compararive plant, Mr. Baehr, and I wish you would state, if you can without too much trouble, the per cent growth of the plant covering the years that you have given in making you- comparison.

1480 A. In the year 1911, the comparative plant sells no gas. In the year 1912 it sells no gas. In the year 1913, as shown on page 140, the consumption of the comparative plant is estimated to be 135,111,000 cubic feet. That cannot be compared to the consumption of the preceding year by percentage because the preceding year was nothing. In the year 1914 the comparative plant consumption is estimated to be 417,399,000 cubic feet, which is an increase over the previous year of 282,286,000 cubic feet, which is approximately 208 per cent increase.

Q. Is that the year 1914?

A. Yes, I was discussing the increase of 1914 with those of 1913 in the comparative plant. Now in the year 1915 the estimated consumption of the comparative plant *os* 623,709,000 cubic feet, which is an increase over the preceding year of 206,312,000 cubic feet, which is equal to an increase of about 49.4 per cent over the estimated consumption of the year 1914. In the year 1916 the estimated consumption of the comparative plant is 692,549,000 cubic feet, which is an increase over the consumption of the yea · 1915 of 68,840 000 cubic feet and which is an increase of about 11 per cent. In the year 1917 the estimated consumption of the comparative plant is 743,010,000 cubic feet, which is an increase over the estimated consumption of the year 1916 of 50,461,000 cubic feet, or approximately 7.28 per cent.

Q. Now that comparative plant, or rather your figures on your comparative plant cover a period of seven years?

A. Yes, sir.

Q. Now, what is the average per cent growth for those seven years?

A. The seven years comprise the period from the inception of the enterprise until the comparative plant is estimated to have caught up with the going plant and two years of that time is taken for *for* construction without any gas being manufactured. I do not see just exactly how I can compare the average sales with the sales during the construction period when there were none.

1481

Q. I am not asking you to compare them at all. I am simply asking you to take the percentage you give me and give me the average per cent increase for the period you used in making your comparison of the plant.

A. I would like to have a little time to do that, because I believe that has to be figured on the basis of the weighted average.

Q. I will put it in another way. You started with 1914, 1915, 1916, and 1917, four years; now give me the average per cent increase during these four years?

A. If I understand you, you want the numerical average of the percentage I have stated?

Q. Yes, for those years.

A. The numerical average of 208 per cent, 49.4, 7.28 per cent and 11 per cent is 68.92 per cent.

Q. Now I wish you would take the Des Moines Gas plant for the years—well the last four years preceding the 31st day of December, 1910, and give me the per cent.

A. As shown on page 138 of my report, the per cent of increase of the Des Moines Gas Company for the years 1907, 1908, 1909 and 1910, inclusive, *are* 15.4.

Q. You are giving them by years?

A. Yes; the percentage increases for the years named are respectively 15.4, 7.3, 7.8, 7.0 and the numerical average of these four figures is 9.375.

1482

Q. Now these figures of increase as shown on your report on page 138 represent the correct figures as they appear in the books of the Des Moines Gas Company, do they—I mean those are the actual figures showing the actual sales?

A. They were given to me on memoranda from the Company in typewritten form and I believe they represent the actual figures as shown on their books.

Q. It was at least so represented to you and you understood it so?

A. Yes.

Q. In your examination in chief, Mr. Baehr, you referred to Massachusetts gas statistics. What is the rate for gas in Massachusetts—we don't care to have you go through the entire records of Massachusetts, but in a general way tell the low price and the high price.

A. It is not in my memory and I would have to look it up.

Q. You referred to it in your examination in chief and that is the only reason I inquire about it now.

A. I have no figures of rates in my mind; the figures that I referred to in my examination in chief were in reference to the average size of mains and the unaccounted for gas of certain Massachusetts companies, certain typical companies, as I took them from

the report of the Board of Gas and Electric Light Commissioners of the commonwealth of Massachusetts, marked the Twenty-sixth Annual Report.

Q. That is the book which you had in mind when you referred to Massachusetts statistics, the statistics appear in that publication?

A. Yes.

Q. In the memoranda that was furnished you showing the operating expenses for 1910, were the details set out, the items of
1483 operating expenses?

A. Yes.

Q. Do you have that memoranda with you now?

A. I have.

Q. I wish you would produce it.

A. (Witness produces memoranda) The only copy in detail which I have in my possession is a copy from some figures which I received, the original of which I have returned, and this copy was made in my office. I believe it is a correct copy of the figures that were furnished to me.

Q. The memoranda handed me, Mr. Baehr, covers three years, does it not?

A. I believe so.

Q. 1908, 1909, 1910?

A. I don't know whether that covers the calander years or not; I would have to look and see.

This memoranda covers the year ended September 30, 1908; the year ended September 30, 1909; the year ended September 30, 1910 and the year ended December 31, 1910.

The MASTER: That is the whole of that year, 1909?

A. Yes, that is covered separately and entirely.

Q. I wish you would turn to page 149, Mr. Witness, of Exhibit 21—no the page following 149, this sheet following page 149; now what do you have to say as to whether or not the information set out, the figures set out on that page were taken from these two sheets you have just handed me, that is so far as it refers to the going plant?

A. The figures for gas sold in Des Moines and in Valley Junction, the total unaccounted for gas, the total gas sent out from the gas plant and the operating results in detail of the entire
1484 plant for the year 1910.

Q. I should have limited the question to 1910.

A. They are taken and I believe are a correct guide of that paper that you have now.

Q. Now, all of the rest of the figures on this sheet following page 49, 1911, 1912, 1913, 1914, 1915, 1916 and 1917, are your estimates of the future condition of this property in its relation to the city of Des Moines and the manufacture and sale of gas?

A. All except the column which I call the adjusted column for 1910.

Q. Where is that column?

A. You will notice that the first two columns of figures in 1910 give the actual operating results.

Q. That is the first two columns?

A. Yes, and the next two columns give my adjusted operating details for the same years. The rest of the figures are my estimate of the future up to and including the year 1917.

Q. Do you mean by that your adjustment simply amounted to taking out Valley Junction?

A. My adjustment made a proper allowance as near as I could estimate it of the cost of supplying the gas to Valley Junction and I also adjusted certain other items.

Q. Just how did you mean?

A. I can illustrate that best by an instance. If you will refer to the general heading "distribution" you will find a left-hand item called repairs mains. This item you will find as stated in the actual operating results to have been for the year 1910, .0176 or 1.76c. per thousand feet of gas sold. Now, in my judgment an allowance of 1.25 per thousand feet gas sold if carried as a contingent
1485 account from year to year will be sufficient to cover main repairs, and I therefore reduced that figure. Then there were certain other figures that I treated similarly. For instance, repairs meters; that figure for the year 1910 was .0098, and in my judgment, derived from my experience, I figured that the proper allowance to cover this item should be .0150.

Q. In other words, you increase that materially?

A. I do, because from my experience I feel that the figure .0098 is not sufficient to properly maintain the meters.

Q. Then if we take the footings at the bottom of the sheet under your so-called adjustment column, is that carried into more than two columns?

A. No, sir.

Q. Well, now, when you get down to the bottom you increase rather than diminish the percentage, *did* you not, from .0594 to .0600?

A. No, I think you will find I decreased it.

Q. Where is it?

A. The total operating expenses, not including taxes a*b*d depreciation, giving now the actual results for the entire plant for the year 1910 were .5908. In my adjusted results the figure is for the same year .5867.

Q. Then you reduced it slightly?

A. I did.

Q. Now, then, aside from these changes or adjustments, as you call them, all of the figures and information set out on this sheet following page 149 of Exhibit 21, and under the years or figures 1911, 1912, 1913, 1914, 1915, 1916 and 1917 represent your estimates and your judgment of the future operations of the plant in Des Moines?

1486 A. During these years, yes.

Q. I mean during these years. Now how does that growth or increase compare to the percentage you gave me for the last four years—take the first four years of your estimated operations, how does it compare with the last four years of the plant, is that percentage increased or smaller, if you can tell off-hand?

A. I don't understand whether you are referring to the sales in cubic feet or increase in operating expenses.

Q. Well you have carried increase in all these items. Now take the increase in sales or the increase in gross revenue or net revenue; but since the other was sales, if you will take the gross sales for the first four years of your estimate and tell me how it compares with the last four years of the company's actual sales.

A. I have estimated that the percentage of increase each year over the preceding year of the Des Moines Gas Company for the next four years is less than the same percentage of increase each year over the preceding year of the Des Moines Gas Company for the past four years.

Q. Can you give me the per cent increase for the four years of your estimate you have given me for the last four years of the plant, I want to make a comparison if I can.

A. The average per cent increase of sales of the Des Moines Gas Company for the year- 1911, 1912, 1913 and 1914, that is, the numerical average of the percentages as enumerated on page 138 of my report is 5.745 per cent.

Q. And the other was—I don't remember the figures you gave me?

A. The other was 9.375 per cent.

The MASTER: When you say nine point, what do you mean?

A. I use the word point in place of the word decimal.

1487 Q. Now turn to the second sheet following page 149, and I wish you would state how much, if any part, of that sheet is a mere duplication of the preceding sheet?

A. The details shown in the column headed going plant 1910 together with the names of the detailed accounts is a copy of a column of those same names on the preceding sheet.

Q. Now, all the rest of this sheet then, if I understand it correctly, is your estimate of the growth or rather is your estimate of a comparative plant showing the growth of the comparative plant beginning with the organization in 1911, 1912, 1913, 1914, 1915, 1916 and 1917.

A. It is.

Q. Now, in arriving at these figures you have used almost altogether your own judgment and estimate as to the amount of business that would be done in the different years?

A. I have based that estimate on my judgment of the rate at which the business would be developed.

Q. In other words you have increase, as I remember it, between the year 1914, that is, the increase in the year 1915 over the business or sales of 1914, of 208 per cent; now you of course simply guessed at that, did you?

A. No, sir.

Q. How could you arrive at it in any other way?

A. That is the result of a careful estimate of the development of this business based on my experience of the rate at which construction work of this kind could be reasonably carried on.

Q. Why didn't you take the plant already here and start with

that as a basis of your calculation for growth and take the actual growth as it has been demonstrated here to base your figures on that?

A. The figures that I had were based partly on the growth
1488 of the city. The estimate of the growth of the going plant, that is, the estimate of the increase of sales of the actual or going Des Moines Gas Company in arriving at that I took into consideration the probable growth of the city.

Q. But how could you double, more than double the sales in the one years between 1914 and 1915; how did you figure that?

A. Well, that is estimated on the basis of the comparative plant, and you will remember that the first district of mains were laid, were estimated as laid and the services estimated as laid in the year 1912; and in the year 1913 the mains and services of *of* district number two were estimated as laid; therefore the rate of construction going on, new mains to cover new territory is as estimated and that in itself is estimated to cover gradually the ground each year.

Q. Yes, I know; that simply goes back to another guess or estimate. You worked that out in your own mind, the amount of mains that might be laid; you did not take the present plant and take any years of its existence to find out how it grew with respect to the laying of mains?

A. In my estimate of the going plant and in my determination of the average age of the mains you will find I have used a table showing the actual feet, each size of main laid each year of the actual Des Moines Gas Company from the year I believe 1887 up to and including the year 1910; I had those actual figures.

Q. Now, Mr. Baehr, if any of these columns of figures should turn out to be radically wrong, then your whole scheme of valuation falls?

A. No, sir; I do not see how much an assumption could make my whole scheme of valuation fall.

Q. Doesn't all of your valuation of this plant depend upon
1489 this so-called comparative plant; isn't that the way you worked out the valuation?

A. I used the method of the comparative plant for the purposes of basing my judgment of what the going value of this plant is. In the reproduction of such a thing as a building or water gas set I cannot see how the two tie together.

Q. But you tied the valuations all together. Isn't it true that your valuation, your final amount there that you fix as the value of this plant is worked out on this comparative plant system and depends upon the accuracy largely of your judgment as to those subsequent events, isn't that so?

A. I believe that the features or details of the operating costs of the comparative plant depend upon my judgment, but that judgment is based on the results accomplished here and on my general experience.

Q. But there is no way, of course, for us to separate what weight or how much your general experience figured in here; how much you based those figures on actual conditions in Des Moines. If, for instance, it should turn out that these estimated earnings were much

less than what you estimated them, that would disturb your whole scheme of your comparative plant and your going plant too, as far as that is concerned?

A. If the estimated development of the comparative plant, that is, if I have estimated that development has been too quick, it would tend to raise the going value, it would tend to exaggerate it; my estimate is based on my judgment as to what is a fair and reasonable amount of time to accomplish it.

Q. Yes, but all these figures must be here for some purpose; does your valuation rest largely upon these figures showing the comparative growth of your comparative plant, that is all I want to

1490 know.

A. My judgment of the going value is based to a large extent, to some extent at least upon the result of this calculation.

Q. That is true of going value and true of the taxes and interest?

A. I used my best judgment in arriving at these results, yes.

Q. The whole thing depends whether the scheme you worked out here works out finally, in the end?

A. If I understand you, the going value calculation, that is the result arrived at in the going value calculation depends on the length of time assumed for the business development.

Q. I was not quite ready to get into the going value question, but I want to ask you this question in that connection: now your final figure of the total valuation of this property of course would not be the same as it is if you had estimated the taxes one hundred thousand dollars less, would it, or one hundred thousand dollars more?

A. If the taxes had come at one hundred thousand dollars it would not accord with my judgment.

Q. And if they had come at one hundred thousand dollars more, it would not accord with your judgment and your figures would not have been the same if your judgment had been in favor of one hundred thousand dollars more taxes?

A. These figures are the result of my judgment.

Q. That is exactly what I am trying to get at, and the whole scheme depends on the accuracy of your judgment, that is true?

A. If I understand just what you mean by the term judgment in that respect, I think I could answer you.

The MASTER: Judgment is the conclusion reached; is it your judgment those things will happen, that is what he means by it.

A. Yes, it is.

1491 Q. What I mean of course in addition to the suggestion is, in every case now, of course, is there any single item in here in your report the value of which is fixed in any other way except upon just your estimate and judgment as to what it is worth?

A. In order to answer that I would have to go through all the figures again.

Q. Can you think of any one thing now, except the real estate?

A. Excepting the real estate, yes.

Q. So that there isn't any item in the whole list upon which you

fixed a value that you got from any actual existing figure showing the costs?

A. Well, I based my judgment, you understand, on a great many things.

Q. In the end it was altogether judgment?

A. I used my judgment on all figures.

Q. If they didn't suit you, you raised them or lowered them, whichever you thought was the thing to do?

A. I exercised my judgment and treated them accordingly.

Q. You referred to surplus capacity in this plant. I wish you would tell the Master how many miles of main the plant just as it stands today would carry?

A. Do I understand you to mean by that that the plant as it stands today, how many miles of main it would serve in Des Moines?

Q. I mean the first of January in all these questions.

A. The capacity of this plant, I am speaking now of what I call the net, safe manufacturing capacity, I figure the net manufacturing capacity at three million cubic feet per day, with the exception of the purifiers which have a lesser capacity.

Q. That is not exactly an answer, but I will put the ques-
1492 tion in another way——

A. I was coming to that. Now the number of miles of main a plant like this could serve depends on so many factors that I doubt if I could answer it.

Q. Don't you have a general knowledge about that, take a city the size of Des Moines with a plant such as this is and apparatus and so on, about the usual average number of miles can be served by that sort of a plant?

A. That varies a great deal Mr. Byers, and with different plants and depends——

Q. How many miles did you put in your new comparative plant?

A. Up to January 1, 1911, I estimated the miles of main of the comparative plant would be to reproduce those existing in the Des Moines Gas Company.

Q. Let me put it in another way: How many additional meters could be served on this line just as it stands by this plant in thousands?

A. I don't believe I can answer that question.

Q. Give us your best judgment.

A. The number of meters—I am reasoning out loud for a moment—the number of meters on January 1st was approximately 20,000. The maximum day's sent-out was some over 2,200,000. The plant with its present capacity could serve some additional meters, but I do not believe I can hazard a guess because I am afraid it would be only a guess.

Q. How many additional services—would you answer the same way as to services?

A. I think I would be obliged to.

Q. How much additional output of gas then could be made, put it that way?

1493 A. If you mean by that that the mains have capacity enough to take additional gas, I would say they could take some additional gas.

Q. Well, how much, give us your judgment?

A. That again, Mr. Byers, depends on so many factors, it makes a definite answer to that question almost impossible.

Q. You would have to have time to work it out as you worked out these other matters in your report?

A. I would be obliged to assume a great many conditions and would have to go through a great deal of work and then I would have to give you a dozen different kinds of answer on that.

Q. All right, we will let it go that way then. Now can you give us an estimate as to how much additional gas or extra gas over the present output could be taken from the works by the mains that are in and say carry it a half a mile or a mile?

A. I think that question ties right in with the previous one; I would have to make my answer in the same way, because in my previous answer I was talking about capacity of what is.

Q. Of course, if you were going to build a gas plant somewhere or recommend it, you would have to figure it all out?

A. Certainly.

Q. There isn't anything amusing or awkward about the suggestion?

A. Not at all; it simply involves a great deal of engineering work and computation.

Q. Now, in estimating the expense or rather the additions that must be made to this property in the next seven years, or the period you have used, as I remember the figures, they sum up to about $1,056,000.

A. That was on the assumption of a three million foot holder being constructed in that time rather than a two million
1494 foot holder; the holder figure was $250,000.

Q. And sixty miles of main—now you must have gone through that process of determining the amount of gas this plant would carry and the number of miles of mains that would be necessary in the future—I don't care to haggle about that at all, but you put the additional mains at $400,000 and the meter services at $150,000 and the increased population at 20,000. Now would it be a safe method if we want to check up on your judgment for us to take the same period in the life of the present gas company when there was an increase of 20,000 in the population, and ascertain what additions were made to the plant to take care of that as it actually existed here in Des Moines, would that be a safe thing for us to do?

A. Why, I based this entirely on percentages, and I think that takes experience, Mr. Byers, to do that.

Q. You could have told to a cent, couldn't you, just how much money the Des Moines Gas Company had expended in additions that were necessary to take care of an increase of 20,000 in the population of Des Moines, couldn't you?

A. Not to a cent, no, sir.

Q. Of course, I used that word cent like millionaires use it.

A. In making up my estimate of the future construction requirements I based that on a percentage method. There are so many things to take into consideration that a detailed estimate such as I think you have in mind would take a tremendous amount of computations and drawings and all that sort of thing.

Q. Now the very fact that you have to solve the problem in the way you say by taking into consideration so many things and then using your judgment upon many of them as to how they
1495 appeal to you and satisfy your judgment, wouldn't it be a good deal safer and a better way to determine what that expenditure would necessarily be by consulting the past and what actual years in Des Moines have shown was necessary, wouldn't that be better?

A. I think if I understood you, for the purpose of making an estimate of the construction requirements as it is wanted, this method I have used is sufficient.

Q. Well, sufficient for the Gas Company, but how about the public and other people interested in having the thing worked out so that it will be helpful to them?

A. Those figures are reasonably accurate.

The MASTER: Does net income have anything to do with the going value?

A. Yes, it is one of the factors of the going value calculation.

The MASTER: Suppose the physical valuation as you made it is $2,711,271.

A. That is without the going value.

The MASTER: Now what income would you expect on that in order to use the going value?

A. That amount is used in figuring interest on unemployed capital for the comparative plant.

The MASTER: What rate of income, suppose it was only one per cent on that amount, would the plant have any going value?

A. Yes.

The MASTER: If it was only one per cent on that amount?

A. If I understand you, you are referring to the going value calculation.

The MASTER: I am referring to the actual going value. If there was one per cent net income on the $2,711,271.

A. The income is one of the factors entering into the
1496 determination of going value, and if that varied it would produce some variation in the going value; I did not get your idea at first.

The MASTER: Did you figure six per cent on that amount?

A. I did not figure any rate of return on that; I took the present rate for gas, rather the rate of January 1st.

Q. Now, Mr. Baehr, let me test that proposition we were dealing with a minute: assume that during the last seven years the population of Des Moines had increased 30,000, and then if it should appear that the Des Moines Gas Company, which during that period was the only company furnishing gas in Des Moines, had only been

compelled to spend $500,000 to take care of that increase in population, in additions to its plant, which figure would you rather take, what it had actually cost this company to take care of an increase of 30,000, or take the estimate you make to be necessary to take care of an increase of 20,000.

Objected to on part of complainant as not a proper hypothetical question, and because the increase in population in the last seven years is nothing like 30,000, and because there is no evidence as to the actual amount expended. I think the court will take judicial notice of the census and will note that it is considerably less.

A. I would place reliance on my own estimate.
Q. Rather than the actual situation if you could ascertain it?
A. As you put it, yes.
Q. You looked these buildings all over down here?
A. Yes.
Q. You included in your report the valuation on real estate?
A. Yes.
1497 Q. And also on the buildings?
A. Yes, sir.
Q. Do these buildings add anything to the value of that real estate?
A. I considered the value of the buildings entirely separate from the real estate.
Q. I understand that; suppose that property was st-ipped now of the gas apparatus, take the naked property, the real estate with these buildings just as it stands, would the buildings add anything to the value of the real estate?

Objected to on part of complainant as irrelevant and immaterial and not based upon any hypothesis or fact.

A. I would estimate the ground would be worth without any buildings on it, at least as much as I have estimated it.
Q. That is not quite and answer. Strip the property, take the apparatus out of it, leave nothing there but the buildings and the land—you have explained that it is not accurate, and that you do not expect anybody to place any considerable reliance on your valuation of the real estate, because that is what somebody else furnished you—now I want to know your judgment as to whether the buildings add anything to the value of that property down there, the real estate?

Same objection as last above made, and it is not cross examination and the witness is not an expert on real estate.

A. I cannot understand what is meant by that, because I never considered it in that way.
Q. What I mean by it, the rule as I understand it with respect to this class of property and this class of cases, unless buildings add something to the real estate value they are not to be considered; so I want to ascertain whether you considered them because
1498 you thought they added value to that real estate.

Same objection as last above made.

A. I do not believe I can answer the question, Mr. Byers.

Q. Well, you have placed a value of $86,000 on these buildings down there—I am not pretending to be accurate—now then, would those buildings be worth that with the gas apparatus out, out of the building and off the property, leaving the buildings on the real estate, would they be worth any such sum of money?

Same objections as last above made.

A. I estimated those buildings as of themselves, just took into consideration the actual material and labor going into each building.

Q. You don't quite answer the question yet——

The MASTER: He wants to know what they would be worth for anything else?

A. My estimate of the buildings would be unchanged.

Q. They would be worth it just the same?

A. The buildings, yes.

Q. Why did you refer in your examination in chief in speaking about their valuation on your comparative plant to piecemeal construction?

A. Because in any gas plant there is piecemeal construction.

Q. There is no piecemeal construction in reconstructing a gas plant?

A. If the work is undertaken as a reconstruction proposition as a whole there would probably — very little piece meal construction, but the fact remains that piecemeal construction has taken place in that property and I feel it is fair that an allowance for that be made.

Q. Well, you didn't build your comparative plant by piecemeal construction, did you?

A. It is not estimated in the sense of a physical building in
1499 that way, but I do think it is fair to make some allowance.

Q. Did you see any indications of electroliers here?

A. I have not personally made an investigation.

Q. If there was such a condition existing, with respect to the mains, it would make a great difference in your valuation?

A. The present value of the mains service has been determined on the basis of composite age and composite life. If I knew the exact physical condition of the entire main system, I would exercise my judgment as to its value.

Q. Of course, if the electroliers existed to any considerable degree, then your whole computation as to the mains would be changed?

A. No, because I inquired to some extent about those.

Q. Anyway there is nothing of that kind here that you know about but you mentioned that inadvertantly not indicating there was any such condition here?

A. I do not believe I mentioned it inadvertantly.

Q. You didn't mention it on the theory that there was any such condition here now?

A. I believe I spoke of the electroliers as one of the unknown things we may have to face.

Q. You referred to a large number of gas properties you have been

connected with and many of them of which you had made valuations and referred in your experience generally with respect to the price of gas and the valuation of property and so on; have you in your comparative plant proceeded on the theory that the gas covering that period would be sold at a dollar per thousand?

A. The determination of those figures, rather that method
1500 of calculating the going value was as of January 1, 1911 and I took the price which was in existence at that time, which was one dollar per thousand cubic feet, a little over.

Q. It averaged something over a dollar because of this extra ten cents?

A. Yes.

Q. What effect do you think the reduction of ten cents per thousand would have upon the figures of your comparative plant, taking that as a basis?

A. That is a very difficult thing to answer. To use a figure of ten cents less would change the calculation to quite a considerable extent; I wouldn't want to say off-hand what the outcome would be.

Q. By what per cent would you say it would increase the sales as you have stated them in your comparative plant proposition?

A. I am not able to say that it would increase the sales at all, because my judgment in that respect is that there would be very little, at least not much difference between the sales at the dollar rate and the ninety cent rate.

Q. What was the result of the reduction of the rate of gas in St. Louis where you were so familiar with the situation?

A. This year?

Q. Yes and prior years.

A. In this year they made a reduction of the price of illuminating gas at St. Louis and I understand they are very much disappointed in the showing of increased business.

Q. When do you say they made the reduction?

A. On April 1st.

Q. Take the reduction just prior to the last one; how did the sales run?

1501 A. I was in St. Louis from 1903 up to the early part of 1909 and during that time there was no change in the price of gas.

Q Well, you understand, Mr. Baehr, I am asking you generally about St. Louis and the effect of the reduction of the price of gas in St. Louis on sales of gas; whether the sales increased or diminished, and I am speaking generally now referring to a period of say the last ten years?

A. I will try to answer that by stating that is one of the most difficult things that I know of, to state definitely, because in St. Louis during the time I was there there was a tremendous increase in the amount of mileage of mains and in the number of services and meters; not only in St. Louis but also in St. Louis County, the gas they had was supplied from the gas plants in the city of St. Louis. I do not believe I can give you any judgment as to the effect of prices on the sales of gas in St. Louis.

Q. How was it in Minneapolis?

A. I do not know.

Q. Isn't it true, Mr. Baehr, that while a low price of gas is a gain for the consumer, it is also a protection against competition either from new gas companies or electric light appliances?

Objected to on part of complainant as not being cross examination. There is no objection to counsel going into this if they want to make the witness their own witness.

A. I think that is a question involving so many considerations that I wouldn't want to undertake to answer that on so short thought.

Q. Well, in your experience in all these different matters you have spoken about the reduction in price resulted in stimulating
1502 the business of the gas company?

Same objection as last above made.

A. Generally speaking, which I understand, what you desire, the gas business has been increasing from year to year in the different plants with which I have been associated, and I cannot answer what percentage, if any of that growth was due to change in prices.

Q. You will say, however, I suppose, will you not, that there has been a gradual but constant increase in the sales of gas and quite a steady and quite a regular reduction in the prices?

Same objection as last above made.

A. Well, various companies from time to time have made reductions in the price of gas. Of course if you consider gas like natural gas which is sold at a very low price, the consumption of that gas per consumer is greater than the consumption of illuminating gas and that is sold at a very low price.

Q. Now, in a general way what is the difference or what has been the reduction in the general range of the price of gas throughout the country in which you have had your experience in the last ten years?

A. Well, during the time I was at Milwaukee there was no change in the price of gas.

Q. I am speaking now generally, in ten years, the difference between the price now and ten years ago generally?

A. I think the general tendency, considering it, I believe, as you are looking at it, has been to get to dollar gas.

Q. That don't quite answer the question.

A. I know it doesn't, but I am a little at sea, I don't quite understand what you want.

Q. You know about what the general range of prices of gas
1503 was ten years ago; what is it now compared to ten years ago, if you can tell me.

A. I do not believe I can tell you.

Q. Mr. Baehr, as I remember it, the difference between the gross revenue on one hand and operating expenses and taxes on the other for the year 1910, according to Mr. Lea's curved sheet, a blue print of which you have, was in round numbers about $175,000; now you in your computation here and in your exhibit 21 have figured

upon a depreciation fund of ten per cent as I understand you, on the gross revenue, which would be in round numbers $53,000; now that would leave for the year 1910 a net profit to the Des Moines Gas Company of $122,000; now with that figure in mind, a net profit of $122,000, you fixed the present value of the property of the Des Moines Gas Company, as I remember it, and have it on my notes here, on page 17 of your Exhibit 21, at $3,221,166. Are the figures right?

A. That last figure is.

Q. Now your computation and scheme of figuring it, or plan which ever is the better word, of figuring out going value resulted in the figure of $509,795.

A. Yes.

Q. Now subtracting the going value from the present value, as you give it on page 17, would leave, if I had made the correct substraction $2,711,371.

A. Yes.

Q. Now assuming those figures are correct, and the amount shown by Mr. Lea's curved sheet was the net profits, and that the ten per cent was taken out, $122,000 is the net profits, now the $122,000 would be a profit as I figure it of 4.5 per cent, do I have it
1504 right?

A. The percentage is correct.

Q. Now, then, how much would you have to raise the price of gas in order to get a fair return on that valuation?

Objected to on part of complainant as not cross examination.

A. I want first to correct a statement you made in reference to one of my figures. I have not used the depreciation as ten per cent; it is ten cents.

Q. Ten cents I should have said; and that would have amounted to $53,000?

A. For last year, yes.

Q. In round numbers it would be 53,000?

A. Yes.

Q. How much would you have to raise the price of gas in order to produce a fair return on the valuations that you figured out?

Complainant interposes the same objection last made.

A. I wish to state that I cannot answer your question, Mr. Byers, for the reason that I do not claim to be an expert on fair return.

Q. You are an expert in the gas business, and you have as I understood you in your examination in chief, made valuations for bond companies and for people who contemplated investing in gas plants and who contemplated the purchase of gas plants and you made numerous valuations for the owners of gas plants for the purpose of arriving at a valuation?

A. Yes, sir.

Q. I want to put this question to you and I think it is entirely a fair one: If instead of being called upon as you were here in this

particular case to furnish a valuation for this company or
1505 fix a valuation upon its property for the purpose of using in this trial as evidence, you had been called upon by some person who was about to invest his money in the gas plant in Des Moines, and he had employed you to come here to go over this property carefully, examine into every detail with respect to the character of it, quantity and quality and all that sort of thing and fix a value upon it on which you would be willing to advise him to make a purchase, and you had come here and gotten all the information that you did about the physical property and had worked out the valuation just as you have here until you found a total of $3,221,166 just as you have given it here, and then when you come to make up your report you checked over your figures and you found that the actual earnings of this company in this field, equipped as you found it on the first day of January 1911, the actual net earnings of the company was only returning one and one half per cent, or four and one-half per cent, either, on your valuation, would you advise your client to buy the plant?

Objected to on part of complainant as not cross examination, merely argumentative, irrelevant and immaterial.

A. If I had found that the return was only one and one half per cent I certainly would not advise him to purchase the plant.

Q. At the valuation you had found?

A. Yes.

Q. Well, how about the four and a half per cent?

Same objection last above made.

A. When you get into the question of what a man might be willing to take as a return on his money I must state that I am not an expert on a matter of fair return.

Q. You are an expert on values?

A. I think I am.

1506 Q. Let us put it in another way and see what your answer would be. As I remember it, in your explanation and in your definitions at the beginning of your report, among other things, you defined this so-called going value as a created income; now keeping that definition in mind, if after you had made up your figures just as you have, you had found by actual computation that the net earnings of the business of this company would not pay a return over say three per cent or four and a half per cent on your $2,711,371, where would your created income be for your going value?

A. In answer to that question I would say that my judgment of going value rests upon the facts of the net earnings, or rather my best estimate of the net earnings of the going and comparative plants, and in order to form a different judgment I would have to have a set of conditions entirely different than they are here, or were here on January 1st, 1911.

Q. I know, but testing your theory or proposition, what would your going value, your $509,795 be worth to anybody if it didn't

earn anything; what would it be worth to your contemplated purchaser or to a man who is going to invest his money, if it was not earning anything or could not earn anything.

A. The question of the amount of going value in case the property earned nothing and could earn nothing, that would of course affect the going value.

Q. It would wipe it out entirely, wouldn't it?

A. Well, if over a number of years into the future, I mean a considerable number of years, it was known definitely or as surely as anything can be estimated into the future, that a property would have no net earnings, as a practical proposition, the going value would be very small.

1507 Q. The property would simply be worth whatever it would sell for junk—now let me put it in another way and see if we can get any further light on this. If I understand your method now is a scheme that has been worked out here and you put in this going value just as you put in $509,000. worth of apparatus.

A. I added that $509,000 to the capital account as an asset of the company.

Q. You didn't add it to the capital account?

A. I consider it an element of value to the property.

Q. If you added that to the capital account you simply have $509,000 surplus capital; you wouldn't want to figure that into the value of the property for rate making purposes?

A. Perhaps I didn't make myself clear. In estimating the value of this property the amount of $509,795. I have added to the total of the real estate, buildings, mains, etc., and working capital, in order to arrive at my total present or depreciated value of the property.

Q. Well, now if in going through the company's business here you had found among other items of property a surplus of cash of $509,000 would you figure that in here in this valuation for the purpose of this law suit to make rates, if the company had $500,000 odd dollars in cash on hand?

A. That cash is always worth cash.

Q. Yes, but should it be figured in the gas property for manufacturing property?

A. I don't think that exists.

Q. If you had found it you would not have figured that in, would you?

A. Well, that depends on just what that cash was, what it represented.

1508 Q. Well, if it represented undivided profits laying there, simply undivided profits belonging to the stockholders of the company, you would not figure it in as a part of the valuation of the property, would you?

A. I would not considet rhat over and above a fair working capital in arriving at my value of the property, taking into consideration all the other items.

Q. Now, Mr. Baehr, since you put this value $509,795 just as Mr. Lea did, into the value of the property of the company, just as you would a holder down here at the plant, I want to ask you this question: If there was a golder down at the gas plant, no matter what

its size, that was not used in the making of gas at all and was not earning anything for the gas company, and not performing any part of the business of manufacturing gas, you would not put that in would you?

A. If I understand you, you mean that such a holder would not be used or useful in the business.

Q. Oh, it might be useful if somebody wanted to use it; but it is not earning anything; they aren't using it?

A. I don't say I would not consider it, because that holder might be going to be put into use.

Q. What I am trying to get at, Mr. Baehr, just how you get a going value into a property without in some way making it an earning factor in that property; that is, when you are dealing with a gas plant that is in the business of manufacturing gas—I will put another question to you in this way: Assume that six per cent is a fair return upon the property actually used in the business of manufacturing gas in Des Moines; now assume that the net earnings of the Gas Company in Des Moines would furnish a return, produce a
1509 return, of six per cent up in a valuation of $2,000,000 and no more, and the value of the actual physical property now of the company was $2,000,000 and no more, I mean when I say physical property the actual property itself without these additions, could you figure out any going value there?

A. I believe there would be a going value.

Q. What would it be?

A. I can't tell you in dollars.

Q. No, but how would it be valuable to anybody?

A. That affects the question of the rate of return.

Q. That is exactly what I told you. Assuming that the rate of return is a reasonable rate, six per cent on $2,000,000. that that is all this company is earning on that valuation, and that is the value of its physical property, there wouldn't be any going value there, would there?

A. The proposition as you have stated it resolves itself in my mind into the fact that the actual value of the property considered as a whole and considering every element was unchanged, but that the rate of return on the whole property is less than six per cent, as you stated.

Q. Then the value does not depend on the profits at all?

A. In making a valuation of this property the items up to and through the physical equipment and working capital are not based on any propositions of profits, but on what it would cost to reproduce that property.

Q. You can't have a going value without earnings?

A. That depends as I stated a moment ago, if the property according to your best estimate and judgment will not have net earnings over a number of years.

Q. It wouldn't be of any value then, would it?

1510 A. That would reduce the going value to practically nothing.

Q. The truth of the whole business is no one has ever been able

to work out any intelligent basis for fixing going value except upon the basis of early losses?

A. I am not willing to say that.

Q. Who ever had figured it out before this law suit?

A. I think this method of figuring going value is entirely logical and sound.

Q. Going back again, then, to the question that we have been having up for a few minutes, you would not contend to the Master or anybody else that any item ought to go into this total valuation that will not produce revenue, would you?

A. I consider this item of going value as a fair element of value of the property.

Q. You would not claim for a minute to the Master here as an experienced gas engineer and a man of affairs that a single item of property ought to go into this valuation that does not represent a part of the earning property, of the whole property, would you?

A. If I understand you rightly I might answer in this way by saying that this item of going value may be measured by the losses incurred in the development of the business and I will say further that I consider that a fair element of value.

Q. You haven't answered my question. Let us take it this way now and see if we cannot get together: Suppose at some early day in the operation of this present plant or at some time in the past they bought some apparatus, or machinery with a view now of using it in the gas business in Des Moines; they get it down here to the plant and set it up and they found it could not be used here at all,
1511 it is there as a part of the plant, a part of the property, but cannot be used for the purpose of producing gas, and by producing gas producing revenue for the company, you as an experienced gas engineer and witness in this kind of a case would not ask the Master to put that property in at any value?

A. If the management of the company purchasing that apparatus had exercised a reasonable degree of intelligence and knowledge of the business, if they had looked out as well as they could at the time for the interests of the company, I would say that company was entitled to earn on that property.

Q. But I say they cannot use it at all—suppose you get a contemplating purchaser and you are making up a valuation of the property for the purpose of advising the purchase, you would not want your client to pay anything for that apparatus; you wouldn't let him, would you?

A. To start with, I cannot conceive of such a condition existing.

Q. But I want to assume it existed, is not what you would do in that case and isn't that the only rule that has so far been adopted by any court or commission so far as you know in rate making cases, and not by any court as I remember it, even in a rate case, that if in the instance I have cited the company had lost because of this property, and as you say had exercised the best judgment they had, but notwithstanding their good judgment they had suffered some losses, you would measure that, cut by the value of this useless piece of property and you would measure it by the amount of that loss, the money they invested at that time?

A. I presume the amount of that loss would represent what
1512 that particular apparatus you have in mind would cost?

Q. That would be all that company would be entitled to, if anything at all, to have considered as a part of their property?

A. I would not want to answer that without giving it further consideration.

Q. Didn't you in answer here, you did say in one of your answers here, I have the note here, my method is based on early losses. The truth is you did not pursue that method at all, but you accepted the same method Mr. Lea has of taking the difference between the prospective earnings of a comparative plant and your estimate or figures of the earnings of a going plant, and in that way you found a sum here that did not represent anything except the difference between those two figures?

A. To start with, I do not recall using the words you have used; but I believe I said that the going value is sometimes measured by the losses incurred in the development of the business.

The MASTER: What do you mean by that, losses?

A. The losses incurred which may be represented by a deficit in return.

Q. If your going value is represented by early losses as distinguished from created income, then no more should be allowed, I suppose, than just enough to recoup those losses, that would be your idea?

A. I haven't made any investigation into the early losses. I do not believe I can answer that question at the moment.

Q. Let me put it this way, assume a situation like this: here is your gas company in controversy about rates—let me put it in another way; it is conceded by the company and by everybody else involved in the controversy that the gas company in establishing its business suffered a loss of say $100,000 up to the date that the
controversy is being had, and that those were due to the
1513 hazards of the business that they could not control, and had suffered that loss up to the time when the return on their investment was furnishing that fair and reasonable return they ought to have, now that $100,000 measured all that that company should have over and above the physical value in your judgment?

A. If that $100,000 represents the total deficit in net return, that would be a subject which I would give serious consideration in arriving at a judgment of going value.

Q. Assuming that represents exactly the amount of losses and that since the time that the company began to make a fair profit it had not yet got a fair return on its money, would you say it was fair, at least, to not go above the $100,000?

A. I would like a little time to consider that, Mr. Byers.

At this time an adjournment was taken until 1:30 p. m.

1514 1:30 P. M., WEDNESDAY, AUGUST 2, 1911.

WILLIAM BAEHR being continued on cross-examination by Hon. H. W. Byers, testified as follows:

Q. Have you any further suggestion or answer to make with respect to the last question that was put to you Mr. Baehr?

A. Was that the question in regard to the early losses.

Q. Yes.

A. Yes, sir; the method of calculation that I used is not based on the early losses but we reproduce these losses at the present time. That is the early losses were incurred years ago and this method of measuring going value is to take conditions as they are and reproduce the going value at the present time. That is different from the early losses in that respect.

Q. Well why do you speak about early losses at all?

A. You asked me the question.

Q. No, but in your examination in chief?

A. I have forgotten that I spoke about that Mr. Byers.

Q. That is not material now, but at any rate your idea and the idea generally of gas experts in working out this plan you have adopted here or theory is to in that way recoup whatever ea-ly losses the company may have suffered.

A. That is I approached the problem in that way as an engineer.

Q. Well now then suppose you were dealing with a company that had some early losses, that is did business during its existence for less than a fair return upon its money and the difference between a fair return and what it got representing its fair losses and during the later years of its existence it had more than recouped their
1515 losses by increased earnings *earnings* that were above and beyond what would be a reasonable return upon the value of the property, what effect would that have upon going value?

A. The calculation would be based entirely on conditions as they are at the time of the valuation.

Q. Well suppose that was the condition at the time of the valuation. Take the Des Moines Gas Company itself, suppose that an examination of its records from its organization down to the time you were called upon to put a value upon this property for rate making purposes ,ad more than made up all of its losses by its earnings under a rate for gas that wiped out all early losses and gave the company more than a fair return upon the value of the property, what effect would that have had upon your estimate of this so-called going value in this case?

A. I would make the estimate of the going value based on the conditions as I found them at the time of the examination. That is I would try to reproduce the property and the going value in the same way.

Q. That is to say you would work out this going value amount in the same way you did in this case even though the losses whatever they were had been wiped out and more?

A. I would make my calculations in the same way.

Q. Returning again to figures for a few minutes Mr. Baehr on present value as shown in your Exhibit 21, page 17, a six per cent

return upon the present valuation as you fix it $3,221,166 would produce $193,270 as I make it.

A. About that yes.

Q. And assume that the profits of the Des Moines Gas Co., as worked out by this curve sheet as shown in Exhibit 20, Mr.
1516 Lea's report less your depreciation ten cents on a thousand feet of gas 122,000 the increase or difference would be $71,270.00 and I figure that would amount to 13.4 cents a thousand that would have to be added to the dollar rate to furnish six per cent on your valuation. That is about right isn't it?

A. I think that figure is approximately correct.

Q. You set out certain figures on page 144 of your Exhibit 21, purporting to show amount of unaccounted for gas. Is any part of that represented in street lighting?

A. The street lighting as I understand it is taken care of in the sales, that is it is taken care of in the accounted for gas.

Q. You know about the company having a contract with the Welsbach people to furnish gas to them for street lighting purposes?

A. Yes, sir.

Q. What I was wondering was if you knew that in that item of unaccounted for gas any part of the gas that was used in these lights was represented, as I remember it you stated that the unaccounted for gas represented all of the gas sent out, metered out and not accounted for through the consumers' meters, the difference between the two?

A. Also in street lighting.

Q. Well you put that in now.

A. Yes, sir.

Q. That would make your answer more clearly correct than to say that——

A. Yes, I was speaking more generally at that time as to what constitutes unaccounted for gas so as to give a general definition.

Q. When you used the terms you did, the difference
1517 between what was metered out at the plant and what registered by the consumers' meter that would include what went to the Welsbach company wouldn't it?

A. Yes, sir. But this unaccounted for gas takes consideration of the gas used by the lamps.

Q. Now there is another point I don't think is entirely clear in your answer that I think ought to be cleared up to be fair to you. There is a large amount of gas consumption of the amount manufactured down here that goes to Valley Junction. Is that included in any way in your figures in unaccounted for gas.

A. It is in the figures on page 144, but in the going value calculation I have allowed for that portion going to Valley Junction.

Q. Do you have any figures handy there from which you could give us the average monthly or average annual feet that goes to the Welsbach people and the Valley Junction people?

A. I can tell you the sales to Valley Junction in 1910 and they amounted to 6,889,100 cubic feet. Now the amount of gas for street lamps I believe I can give you.

Q. I find here on this sheet you furnished street lighting 8,561,554. Tat I suppose appears in your report there somewhere?

A. I don't believe that shows in my report, but I have information as to that.

Q. Do you find the figures?

A. I have got a figure of sales to public lamps, public street lamps in 1910 of 8,546,498 cubic feet and to private lamps 15056 cubic feet making a total of 8,561,554.

1518 Q. Do you know what is included in these private lamps, what lamps they — and where they are used?

A. No sir; I do not.

COURT: I wish you would give those figures again.

A. Quantity of gas sold in 1910 to public street lamps I have as 8,546,498 and the amount sold to private lamps of 15,056 cubic feet making a total of 8,561,554 cubic feet.

Q. Do you know Mr. Bachr whether in this 8 million is included park lights?

A. I didn't go into the details, I can't tell you that.

Q. I noticed you called it street lights and I wondered if it covered park lights. On page 71 of your report you have meters costing $16,208 that you have given an average age of 29 and one half years. Do you mean by that that these meters of any of them are still in use?

A. There may be some of these meters in use today.

Q. Do you mean that all of them are in use or that there just may be now and then one?

A. I would be unable to say whether these meters were in use or not. There were installed at the end of 1886 all told 1261 meters and whether these particular meters are all in use now or not I am unable to say.

Q. How is it possible to get the average age of meters if you do not know, other than just a forced average which you make yourself?

A. I have made the best estimate of the average age that I could with the information at hand.

Q. So that average age as a matter of fact is based to some extent on your judgment independent of any existing facts in the

1519 as company's property?

A. This is based on the fact as I assume it to be a fact, that there were 1261 meters installed at that time.

Q. But not upon the fact that 1260 are still in use or any of them so far as you know?

A. I can't say that these 1261 meters are in use today.

Q. If the question was to get the accurate average age of 1260 meters installed in 1896, you would have to know wouldn't you just what years the meters were in use in order to get at the correct average age of them.

A. I think this average age I have assigned is perfectly accurate. The meters as you know are brought into the shop and repaired and used over again.

Q. Let me put it in another way. If there was not a single one

of them in use at the time you made your computation would it be accurate?

A. There were at that time the number of meters which I used and the record that I have gives the number of meters installed during each year since and the total is the amount of meters in use at the end of the year or rather on January 1, 1911. I assumed then that it is a fact as given to me by the company that there are 19,903 in use on January 1, 1911.

Q. That were in use for how long a time?

A. And I have gotten at the age in just the way I have shown and that is my best judgment of the method of getting at them.

Q. Were you informed that any of these meters or all of them had been in use that long?

A. I assumed that the meters would be treated as they are treated in any gas company, brought in repaired and sent out again.

1520 Q. Now I will put my former question to you because we don't seem to be getting anywhere on this proposition. If as a matter of fact there was not a single one of these meters still in use at the time these figures were given to you, your average age would not be very accurate would it?

A. In that case if these had been replaced by new meters the average age would not be as great as I have figured it and the present value would be higher.

Q. But that is not quite an answer. Of course to get the average age of a given number of meters by years, necessarily you must know must you not how many years each meter is in use and how many were still in use at the time you made your computation in order to get the average yearly life and existence accurately.

A. I think this method is perfectly accurate. I am afraid I have not made myself clear to you. When a meter is brought in you understand it is repaired and put in shape and sent out again. But if I understand you correctly you would assume that a meter that was bought we will say in 1864 has disappeared a long time ago.

Q. No, I have just a homely notion in my mind and that is the reason I am confused about this proposition, that where you have found the average age of a given number of articles, some one of them at least and a considerable number of them must at least be older than the average age.

A. That is undoubtedly true.

Q. Now if that is undoubtedly true, then it follows that you must have the time that each meter was in use and you must know in making up a computation of this kind how many are still in use in order to get anything like an accurate average age, else I

1521 don't know what you are trying to show by that item at all.

A. Well in my judgment this method is accurate in regard to gas meters.

Q. Does it mean then that some of these meters were in use 29 and one half years, is that what it means, I mean all of them?

A. It may be that there are some meters in Des Moines that are 29 and one half years old.

Q. This computation, by this you are referring to most all of them, if you are simply giving the average some of them were in a long time longer?

A. I will try to make that a little clearer. If some of these meters have disappeared there are new ones have taken their place.

Q. I know, but the other new ones are not in as long as the old ones?

A. That would decrease the average age and make the present value higher than I have assumed it in my report.

Q. I am not worrying about value now, it is this base figure here I am worrying about how that 29 and one half years, why we accept that as the average of the meters represented by that item?

A. I think that is as accurate as I can determine it and I think it is safe.

Q. When it is necessary to relay or repair mains or services un-*under* paving do you know how the cost of tearing up and relaying paving is taken care of,

A. I can speak from knowledge of what has been the custom, I cannot speak of what is the book record of the Des Moines Gas Co. in that respect.

1522 Q. Well generally if you can't as to this particular company?

A. Generally when a main which is under pavement is relaid or repaired, naturally there has to be cuts made through the pavement and that would be a repair account and the cost of that paving would go to repairs. If a service is repaired and a hole cut for that purpose through the pavement that would go into repair account.

Q. And finally get into operating expenses?

A. Yes, sir.

Q. In making up your figures of your comparative plant, do you assume that fixtures and other gas appliances are in the houses at the beginning of the making up of your comparative plant?

A. Yes, I assume the conditions here on January 1st, 1911, are just as they were on tha- date.

Q. Including house piping?

A. Yes, sir.

Q. And you assu*j*ed too at that time that the gas users in Des Moines had arrived at the same state of education on the 1st of January?

A. Yes, sir.

Q. Then if that be true just why did you take seven years to make your comparative plant cross or intersect the dividing line of the going plant?

A. Because I estimate based on my experience and judgment that that is the length of time it would take to reproduce this property and business where a man who is putting up the money to do this work would naturally desire to have it accomplished so as to get a return as soon as he could.

1523 Q. That is all in the field of speculation, judgment and opinion is it not? That is to say you might take a seven year period and thing that was the necessary period in which to

build up this business and another engineer might take a ten year period and still another one take a 26 year period?

A. No, I do not consider that that is in the realm of speculation. It is in the realm of judgment and estimate and if two experienced gas engineers were discussing this problem they would not be very far apart on the amount of work that could be accomplished each year.

Q. Well but they have been as far apart as seven years and twenty six haven't they?

A. I don't recall an instance of a variation of that amount, no sir.

Q. Well you do recall some very great variations?

A. In estimates of the amount of work done?

Q. The number of years now that it would be necessary in pursuing this hypothetical plant or comparative plant proposition for the purpose of ascertaining values, that is all a matter of opinion and judgment?

A. It is a matter of judgment based on experience.

Q. And I think you said before dinner you had used this same method you use here before?

A. Yes, sir.

Q. When did you first use it?

A. I used this method on two occasions prior to using it in the case that is now in court.

Q. I know, but when was the first time you used it, just as to the year, I don't care about the place?

A. In 1911.

Q. This same year?

1524 A. Yes, sir.

Q. I think your comparative plant begins to earn some money first in the third year, is it not, 1913 it begins?

A. I estimated gas would be turned on January 1, 1913 and that the earnings would start at that time.

Q. Why wouldn't you reach the average consumption of the going plant at that time if you have got the services all in and the people were all educated to the use and the fixtures were all there, why does it take any time to work up to this output of the going plant.

A. Because the reasonable amount of time required to lay all the mains and all the services is such that only the mains and services in District No. 1 are completed, at the end of the year 1912, in District No. 2 at the end of the year 1913 and in District No. 3 at the end of the year 1914. Now you must remember that it is assumed that the gas appliances, house piping and fixtures in the residences and in the buildings are in just as they were here on January 1, 1911, but it is estimated that during the years 1911 and 1912, no gas is turned on.

Q. Why not?

A. Well because you are just starting to build the comparative plant.

Q. I know, but why do you take all that time to build it if the demand is here, it is all prepared, the houses all ready and people

all ready to use it and the demand for gas is here why do you fool along for three years to commence serving it?

A. I do not estimate there would be any time lost as you suggested but I estimated that the rate of construction would be carried on as fast as it could be.

1525 Q. Do you also take into consideration, or was it part of your plan than while this comparative plant was being constructed and put into operation there would be competition in the gas business?

A. No, sir; I base my proposition on the assumption that I think it is most clearly understood if you assume a community identical with this one in every respect having all fixtures in the buildings and the people educated to the use of gas and then assume that there is no gas plant in that city you have got to build it, reproduce it and then start to develop business.

Q. Why develop business, the business is there?

A. From January 1, 1911, until gas is actually turned on in order to be logical it is necessary to assume that the people eat in the meantime and have light of some kind in the meantime but it would not be gas, naturally they would not eat gas but use it to cook with.

Q. Naturally have light or go to bed at dusk?

A. Yes, sir.

Q. In that connection Mr. Baehr why do you wait the other four years, why don't you take gas right away when you have got your plant finished and you have touched the button and started the machinery, why is it necessary to have a period of four years more in order to work out this scheme.

A. Because during two years that gas is not turned on it is necessary and people as I say have other means of cooking and lighting and when gas is turned on they would not immediately discontinue the use of the other appliances that they have put in, it is not logical to assume that they would do so and it is necessary to overcome the inertia of people.

1526 Q. I have had your testimony looked up Mr. Baehr, about your statement in chief and the basis you give for going value, it is found on page 1343 and you say this, and I only refer to it because it completes some of the questions I put to you about early losses and will bring to your attention just what you did say about it. In my judgment the method which lends itself to the most accurate computation and upon which I prefer to base my judgment of the going value of this plant is to measure the going value by the loss occurring during the period of development. Now the period of development of the Des Moines gas company of course was the early years of its existence, that is what you meant didn't you?

A. I see I did not make myself sufficiently clear. What I meant to say was that I was reproducing going value as well as the physical property.

Q. Well you did say that later?

A. And that this period of development naturally would have to take cognizance of conditions as they were the 1st of January 1911.

Q. Now you said this further which bears out exactly the notion I had in my mind in the questions. You say, in the instance of the Des Moines company I am measuring this loss by the loss incurred by the Des Moines company in developing its business to its stage and to the revenue as of January 1, 1911. Now applying that statement as broad as it is there to the actual plant itself and repeating one of my former questions to you if all those losses sustained by this company prior to and up to January 1, 1911, had been more than recouped by earnings of the company then
1527 on your own theory there would not be, could not be any just amounts for going value could there?

A. I believe the allowance for going value should be made.

Q. Just the same. Well now let's see. That to me sounds ridiculous, it may not be. Now this method of estimating going value is based on the idea of reproducing the entire physical equipment and the business of the Des Moines company in a given length of time. Now let us take the Des Moines Gas Co., and suppose that upon an actual demonstration it could be shown that for every dollar of money or property or time the Des Moines Gas Company had devoted to the business of supplying gas to the consumers the company had received from the consuming public more than a reasonable return so that on the 1st day of January 1911 there were no unremunerated losses upon the part of the gas company at all, it had already got its money all back and more and all it was entitled to. Would you still figure going value the same way?

A. You are asking me in that respect to assume a condition which I do not claim to be expert in, namely, the condition of fair return.

Q. You are to assume what I have stated in the question to be true and then give me an answer.

A. The only way I can approach a problem of this kind is as an engineer would approach it and if I were asked to value a property I would do so in that way.

Q. Just for a minute if you will get away from the engineering proposition, leave that out of the consideration entirely now, we are dealing with going value, that is not an engineering proposition at all. Now dealing alone with this question of going value it can have no other basis in your mind can it than simply making
1528 the gas company and its owners whole with respect to its investments, could not be any other theory upon which this item could be considered could there?

A. I think Mr. Byers that it is perfectly clear to me that in order to get as a developed business, that it costs money to get that business and as an engineer I would measure it in the way that I have measured it and I believe that that is an engineering problem.

Q. That is all right enough, but if that has been paid back they have that money, that has been made whole, made good then what about it?

A. I think going value exists just the same.

Q. The people have to pay it over again.

A. I am not saying the people have to pay it over again, but I am saying going value is there.

Q. Would not be there unless it earned something and if it earned something it has got to get that from the consumers.

A. It is part of the total value of the company.

Q. The consumers have to pay a return on that in order for it to have any value?

A. Well I consider it as a part of the total equipment of the company and business.

Q. Isn't this the position you finally *you* get yourself into that you do not deal at all with early losses, that early losses have absolutely nothing to do with your plan of figuring going value, your going value rests entirely upon a comparative set of figures the one set representing this going plant and the other a prospective or comparative plant to be constructed over a period of seven years, has nothing to do with the question of losses or whether they
1529 have been recouped or not.

A. The going value calculation as I have made it rests primarily on the fact that the company is a going concern and is doing business and is enjoying a revenue.

Q. How much of a revenue?

A. The revenue of the Des Moines Gas Company.

COURT: Let me see if I understand you. As I get your idea it is this. Here are two cities exactly alike, one has a gas plant like the one here and the other has none, hasn't any gas plant at all and the buyer has a choice between buying this plant here, a choice between taking one and building another one?

A. That is it.

COURT: Now then what you claim going value here is the difference between the present worth of the earning power of the plant as going and the one that you have got to reproduce, is that it?

A. That is it.

COURT: And without regard to whether the plant here in Des Moines is earning anything or not, that is net earnings?

A. I am using earnings of the company as they are.

Q. Then that brings you back to the proposition that losses cut no figure in it at all?

A. Well I can't conceive of any business, any company enjoying a business and having a connected business that has not cost money.

Q. How many dollars of losses is there in your $509,000?

A. That is my judgment of the fair amount to allow——

Q. The question is, how much do you allow for losses?

A. I don't know as I can answer that question.

1530 Q. Now Mr. Baehr have you got the three blue prints here?

A. Yes, sir.

Q. I wish you would let me have them please. Do you know who made them?

A. No, sir.

Q. Do you remember when they were delivered to you?

A. I wish to modify that former answer. I think they were made by some of the people connected either with the Des Moines Gas Company or the Unider Gas Improvement Company. They were delivered to me some time possibly two or three months ago, might be slightly longer.

Q. Do you have the detailed statement of gas sold from 1904 to 1910?

A. Yes, sir.

Q. I wish you would produce that. You have it there?

A. Yes, sir.

Q. Do you know who made that?

A. No, sir; I do not except I presume it was made by somebody in the company.

Q. Furnished to you by somebody for the company?

A. Yes, sir.

Q. Do you have the history of the price of gas as it was furnished to you?

A. Yes, sir.

Q. I wish you would let us have that. You have it there?

A. Yes, sir.

Q. Who furnished that to you?

A. The Des Moines Gas Co.

Q. Now do you have the records of mains laid by sizes during the years 1888 to 1910?

1531 A. Yes, I believe I have that.

Q. Please produce that?

A. All right.

Q. Cost of meters, do you have a statement somebody furnished to you of the cost of meters?

A. It was that same paper we were duscussing I believe yesterday.

Q. Is that the one you read in the record?

A. Yes, sir.

Q. Will you have the reporter mark there and you state what they are?

A. Defendant's Exhibit No. 9 is a blue print entitled Des Moines Gas Company Historical Development Curves No. 1. Defendant's Exhibit No. 10 is a blue print entitled Des Moines Gas Company Historical Development Curves hypothetical plant. In connection with this Exhibit No. 10 I wish to state there are some red inck lines which were made in my office.

Q. Perhaps it might be well unless it does show what they are for the purpose in making them it might be well enough to state just what the red ink changes represent?

A. These red lines there indicate the development as I estimated it. My report contains the figures, and that is just a picture of the figures. Defendant's Exhibit No. 11 is a blue print entitled Des Moines Gas Company Historical Development curves No. 2. Defendant's Exhibit No. 12 is a statement entitled Des Moines Gas Company, detailed statement of gas sold in cubic feet December 31, 1904 to December 31, 1910. Defendant"s Exhibit No. 13 is a statement consisting of four sheets entitled Des Moines Gas Company record of mains laid.

Q. Does that Exhibit show in addition to this record of mains laid the sizes?

1532 A. Defendant's Exhibit No. 13 shows the number of feet and sizes by years. Defendant's Exhibits No. 14 is a statement entitled Des Moines Gas Company, history of prices of gas. De-

fendants' Exhibits Nos. 15 and 16 are statements entitled Des Moines Gas Company statement of profit and loss.

Mr BYERS: As a part of the cross examination of the witness Baehr and for the purpose of assisting in the examination and consideration of his testimony and his exhibit 21, defendant offers Defendant's exhibits from 8 to 16, inclusive.

Q. Now just a few general questions. If you were called upon to construct a new plant to serve this field here, just as it was on the 1st day of January 1911, would you construct a plant just like the one that is here?

A. I think the present plant is efficient and if a man had——

Q. That is not answering at all.

Mr. GUERNSEY: He has not finished his answer.

Q. Of course I know what the explanation about that will be, but I just want to know of that was all there was to it, if you were called upon to construct for some client or was going to do it for yourself would you put in just such a plant as there is down here?

A. It might not be like that plant in every particular, but the important features are modern and satisfactory and I would use them.

Q. Now you know I didn't *you ask them* anything about what features or anything of the kind, simply wanted yes or no, whether that is the kind of plant you would construct?

A. Yes, sir.

Q. Now did you give any consideration in your report or in arriving at the values stated in your report to the original cost
1533 of construction of this physical property?

A. In arriving at my judgment as to the value I based it partly on construction cost not entirely, but based it probably mostly on experience.

Q. You considered that item to some extent, much or little?

A. I consider- it. yes.

Q. How about the amount expended in permanent improvements, Did you pay any attention to that in arriving at your value?

A. The only data I secured from the company -as the construction cost of parts not of the total.

Q. You didn't quite answer my question. I don't like to limit as fair a witness as you are if I can help it, but what I want to know *there* is just simply whether you considered the amount expended in permanent improvements by this company in fixing your valuation.

*Q*A. Will you kindly advise me if you mean the permanent improvements as it is on their books, the total of that amount?

Q. I mean just as they expended the money whether you considered that at all.

A. Only in a very general way.

Q. Did you give any consideration whatever to the amount and market value of the stock of the company?

A. I considered that in a very general way.

Q. Were you furnished with the amount of stock and its market value by somebody?

A. No, sir.

Q. Did you know anything about that aside from the information that might be furnished you by the company?

A. I have seen statements in such books as Brown's Directory of American Gas Companys which gives the——

1534 Q. That don't give actual value?

A. No it just gives amount of stock and bonds.

Q. Did you give any consideration or does your report show in any way that the master or counsel can determine how much if any importance you gave to the probable earning capacity of this property under the ordinance that is involved in this suit?

A. I did not consider that.

Q. I believe you said you did consider the operating expense quite an important item.

A. Yes, sir.

Q. Did you give any consideration at all in fixing your values to the cost of the present plant to the present company?

A. Meaning by that the purchase price?

Q. The cost price to this company, the present company was organized in 1906.

A. I did not look that up.

Q. And no one furnished you any information about it?

A. No, sir.

Q. Did you give any consideration and if so where can the details be found in your report covering the dividends earned in the past and paid to stockholders?

A. I did not consider that.

Q. Or surplus earnings still in the hands of the company and which has not been distributed to the stockholders?

A. I didn't consider that.

Q. Or surplus earned by the company and carried into capital?

A. I don't believe I can answer that question.

Q. Well did you give any consideration to anything of that kind aside from $150,000 you say you found the working capital?

A. This is working capital?

1535 Q. We are talking about capital stock now, not working capital.

A. I see. No.

Q. You have already stated that you do not pretend to know anything about what would be the reasonable return upon property here in Des Moines so of course you have not given that any consideration in arriving at your valuation?

A. I have not.

Q. I mean the reasonable return upon the value of the property used by the gas company in its business here in Des Moines. You don't pretend to know what that would be?

A. I do not.

Q. And didn't give it any consideration? Now I notice in a sort of an itemized statement here of organization expenses an item of $5000 for franchise. I don't quite understand that?

A. By that I mean the legitimate expenses in securing a franchise.

Q. What is the nature of tho-e expenditures?

A. Services of attorneys and hotel expenses and traveling expenses of men necessary to come here to lo-k after that.

Q. You regard it as necessary then to ha-e a franchise do you?

A. I assumed that a company that want-d to do business in the city of Des Moines would have to have a franchise.

Q. And how long a franchise did you consider in fixing the probable expense in getting it for $5000?

A. I made no detail of that account whatever. I made no detailed estimate of that.

Q. Would it make any difference in the value of the property whether the company had a twenty five year franchise or a perpetual franchise, would that make any difference in the value of the property as a going concern?

A. It would not change my valuation in any respect.

1536 Q. Would not re-uce it in any way if it did not have any franchise?

A. It would not change it no sir.

Q. You stated that you did give some consideration to the original cost of the construction. To what extent did you cover the original cost of construction?

A. I mean by that the bulk value of the plant.

Q. Did you have a statement of the original cost of the property of all buildings and apparatus?

A. No.

Q. Machinery and tools, monkey wrenches, wheelbarrows and so on.

—. No, sir.

Q. How much of it did you have any information about the original cost?

A. I believe I have enumerated the items that I got the cost of such as main pipe, fittings, specials, services, store room expenses and such items.

Q. Is that all now that you have information with respect to?

A. That is not all but I enumerated everything I had I believe yesterday.

Q. Have you furnished me a memorandum of all these items you have just mentioned that you had?

A. I have not furnished you all the memorandum no.

Q. I mean with respect to original cost?

A. No, I have not.

Q. What do you have a memorandum showing the original cost of, these buildings?

A. No.

Q. Any part of them?

A. No.

1537 Q. Of the iron?

A. No.

Q. Any part of it?

A. No.

Q. Of the services?

A. I have got a record of the actual cost of services laid.

Q. I wish you would produce that.

A. Yes, sir. Defendants' exhibit No. 17, is a sheet headed cost of services.

Q. And that is the sheet that you used in making up this report and fixing the values of the services?

A. No, sir; I simply studied that sheet.

Q. Let me put it in another way. It is the sheet you used——

Mr. GUERNSEY: I submit you ought to allow the witness to finish his answer?

A. I used this sheet merely as one factor in arriving at my estimate in the cost of services in Des Moines.

Q. That sheet is one of the things that you used to aid you in arriving finally at the valuation you fixed upon services.

A. Yes, sir.

Q. Did you have any memorandum of any kind purporting — the original cost of generators, holders, or anything of that kind?

A. No, sir.

Q. Any of the apparatus?

A. No, sir.

Q. And meters?

A. The only data that I had in the form of memoranda concerning meters is the one already read into the record.

Q. Now Mr. Baehr I would like to have Exhibit 8 for a few minutes for further examination, tha- is the pamphlet study
1538 of life in years.

A. I think I would like to have my attorneys say what to do in that respect.

Mr. GUERNSEY: We have no objections. I don't know whether Mr. Baehr understands the situation, this is his personal property, I don't know whether he wants to retain these or not, if they are offered in evidence, I think they ought to be copied.

COURT: Do you want to retain these?

A. I would like to as they are part of my material on which I base my report.

COURT: I was going to suggest that the reporter make copies of all of them and then you compare them and see they are right and then Mr. Baehr can have the originals.

Mr. BYERS: I would like before the re-examination is begun, I would like to recall Mr. Lea for a moment before Mr. Baehr is re-examined or excused.

1539 HENRY I. LEA being recalled for further cross examination by Hon. H. W. Byers, testified as follows.

Q. I wanted to know if you were furnished with a copy of what the reporter has marked Defendants' Exhibit No. 8 and what has been called by Mr. Baehr a study in life and age?

A. I believe I was furnished with a copy of this same thing, but I have never read it.

Q. Can you tell us about when the copy was furnished to you?
A. No.
Q. Was it before or after you completed your report?
A. It was before I completed the report.
Q. And who furnished it to you, do you remember?
A. I believe Mr. Klumpp did.
Q. Mr. Klumpp?
A. I think so.

Redirect examination by N. T. GUERNSEY, Esq.:

Q. How did he come to furnish it to you if you can tell us?
A. Mr. Klumpp had been working out a lot of figures on the different rates of depreciation on some assumed values. I don't know where these values were obtained nor what they were, but he was working out for his own information as I understood it some studies to see what the different rates compounded annually on different schemes would result in and as an abstract study I was naturally interested in the thing and asked him if he would not give me a copy of it. He said he would. He gave it to me, but I have never yet read it.

COURT: Didn't use it in yours?

1540 A. I used three pages from it in my report. I glanced through it and saw a table there of composite age of services and meters were in that book, those three pages I had copied and the balance of it I have not used in any sense.

Q. Referring to pages 10, 11 and 12, of your report, Exhibit 20, are those the three pages you have just referred to?
A. They are.
COURT: While Mr. Lea is on the witness stand I would like to ask him a question. Can you figure the cost per foot of relaying the pavement or refinishing pavement over mains?
A. Can I figure it, yes.
COURT: And for services?
A. Yes, sir. I have that already worked out in my room at the hotel and I can get it not if you wish or in the morning.

Mr. BYERS: I want the record clear, Mr. Lea is excused for the time being, but we will recall him under the conditions stated the other day.

Witness excused.

1541 WILLIAM A. BAEHR continued on cross examination by Hon. H. W. Byers, testified as follows:

Q. You stated early in your examination in chief, perhaps in your cross examination that when you were out here in January you were looming this plant over and made a sort of an approximate valuation of the whole plant. What was that valuation?
A. The amount of it?
Q. Yes.
A. My recollection is that the total reproduction new was something in excess of $4,000,000.

Q. And about what time in January was that?

A. I believe I stated I was here on January first and second.

Q. And was that the time that you put this valuation on the property?

A. Yes, sir.

Q. And did you state that to the gas company's managers about that time?

A. I believe I did.

Q. And Mr. Haines, did you furnish him your estimate at that time?

A. Yes, sir.

Q. Now how do you understand this property is assessed for taxation?

A. I can't tell you what the method of assessment is, except that the rate for 1910 was 90 mills on 25 per cent valuation.

Q. I know, but were you not advised that in this state manufacturing plants of this character are not assessed like other property?

1542 A. I will try to answer that in this way that the only advice I had was that the tax rate was as I have stated and that in addition to that there is two per cent tax on gross income and then of course the federal corporation tax.

Q. That is not what I mean.

A. That is all I know.

Q. In this state the method ordinarily is that real estate is assessed by itself independently and personal property is assessed separately, moneys and credits are assessed separately and as to practically everything except manufacturing property but there is no separate assessment on manufacturing properties and that assessment is made on the value of the whole property as a completed plant. Did you know that?

A. I did not. I took the taxes as they were paid, the amount.

Q. Your computation proceeds on the theory that all property whether it is worked up into the finished product or not, whether it is a machine or real estate or what it is it was assessed at 90 mills on the taxable value, assessable value.

A. The only way I use the tax proposition at all was to estimate the assessment and then take the rate plus the two per cent income and federal tax.

Q. If it should turn out the Des Moines Gas Company were not subject to assessment at all upon any of its property except after it is in the completed plant and is part of the completed plant, and then is only chargeable with taxes on the plant as completed and operating, would that make any difference with the method in which you figure out the taxes if you had known that?

A. I don't think it would because I used the rate of taxation that I was told was being paid.

1543 Q. I know, but you have charged up taxes on material and taxes on capital and taxes on idle money and taxes all along the line haven't you?

A. I have added taxes to the construction account according to the rate of two and one fourth per cent on full valuation.

COURT: On the amount of work done per year?

Q. On the amount of work done during the year, but on the assumption of taxes, that the rate of construction followed a straight line and therefore for the current year only half of that amount. So that if it should turn out that money invested in a manufacturing plant was not accessible or taxable at all, but that it was the plant itself after finished, upon which the taxes were levied, your method of figuring taxes would be altogether wrong wouldn't it?

A. Well, I don't know whether it would or not.

Q. Take your so called comparative plant you have got a lot of taxes in there the first three years haven't you before you get any plant finished.

A. In the comparative plant, I will find that exactly, in the comparative plant during the years 1911 and 1912, there are no taxes charged to operation.

Q. No, but are there any at all charged to anything? Of course you haven't any charged to operation because you were not operating?

A. There are taxes chargeable to the capital account during those years.

Q. That is true all the way through the whole period, taxes charged up regularly on all of these items according to the value of the separate items as you found it?

A. I didn't compute them separately on each item, but the total of my computation is shown in my report.

1544 Q. You need a percentage method to figure it in the total?

A. Yes, sir.

Mr. BYERS: That will be all the examination now, subject to recall.

Redirect examination by N. T. GUERNSEY, Esq.:

Q. Referring to this January valuation that you speak of. Have you in mind the affidavit that was made by you in connection with the application for temporary injunction or restraining order in this case?

A. That was what was in my mind, yes, sir.

Q. That is what you refer to. How much time were you allowed to look the thing over and make your estimate?

A. I was allowed very little time. It was a very hurried job. I was here two days all told.

Q. Did that valuation give what was then your best judgment taking into account the time you had to go into it and examine the plant?

A. It did.

Q. Now one other matter here that is not in order, but before I forget it. You were asked something about contractors' profits on holders and generators and things like that. I wish you would state, because I don't think your testimony is very clear on that,

whether you have added anything to apparatus, holders and generators and things of that character in addition to the price which the person who is supplying them would in your judgment charge.

Objected to as incompetent, immaterial and not re-examina-
1545 tion.

A. I did not.

Q. Are these things such as I have described ordinarily built by the gas company or ordinarily constructed by somebody else?

A. They are usually purchased by the gas company and erected by the company or party selling them.

Q. In other words they are bought set up in place?

A. Usually.

Q. And for a lump price?

A. Yes, sir.

Q. And in estimating these matters have you taken what you believe would be a fair lump price for them as they are ordinarily bought?

Objected to as incompetent, immaterial and a mere repetition.

A. I have.

Q. And to such prices have you added anything on account of contractors' profits?

A. I have not.

Q. It was this contractors' profit that the man who manufactures and sells these things makes that you said you could not compute and did not compute but was involved of course in their cost.

A. Yes, sir.

Q. Now then Mr. Baehr with reference to this Exhibit 8, will you please state just how you came to get it and what use if any you have made of it?

Mr. BYERS: That has all been gone over.

Mr. GUERNSEY: Hardly by me, has it, with this witness?

Mr. BYERS: Perhaps not.

A. I saw it in the possession I believe of Mr. Klumpp and I understood that it contained among other things studies on
1546 methods of depreciation and among other things a list of the meters installed each year from 1886 up to and including the year 1910. This particular statement of meters installed during these years I wanted and I asked for the book or pamphlet for that reason and it was given to me.

Q. I see on page 31 and page 32 there are some figures written in ink. Do you know when they were put there and by whom?

A. I inserted those ink figures.

Q. Now I wish you would tell the Master fully what if any use you made of this Exhibit 8 in connection with the preparation of your report, excepting as to this matter of age of meters which you have referred to.

A. I didn't make use of the report in relation to the age of meters. All I did was to take out of it the number of meters installed during the years 1886 up to and including the year 1910

and that statement did not take into consideration all the meters installed during 1910 and I made the ink corrections. Otherwise I made no use whatever of that report, merely glanced at it and am frank to say I don't know what it contains.

Q. You were asked by Mr. Byers whether if the plant had earned enough to reimburse itself for the original expenditure on account of the factor which we call going value, whether there would be any going value. Now I want to ask you if the plant had earned enough to reimburse itself for the cost of real estate would you say the real estate had no value or would you say it affected the value of the real estate?

Objected to as incompetent, as well as ridiculous.

A. Not in any way.

Q. In other words Mr. Baehr will you state whether to your mind going value or that factor or what real estate or any
1547 other factor is worth today is affected by whether or not the company *the company* has been reimbursed for it.

Objected to as incompetent, immaterial and not re-examination.

A. Not in the slightest.

COURT: I will state and see if I am wrong as to what I understand this witness. I understood this witness that this going value is estimated upon the difference between the plant as it now exists or the present value of the difference and one that would be reproduced taking the time necessary to reproduce it covering seven years. That is the way I understand this witness. Whether that is properly speaking going value is another question. Your theory as I understand it is that you are entitled to have added to the reproduction cost this amount?

Q. In your valuation Mr. Baehr, if I understand you correctly you have assumed to measure the going value by what you assume to be the cost of reproducing it?

A. I have.

Q. And you have ascertained that cost of reproducing it by comparing the net returns from the going plant with the net returns from the hypothetical plant during the period of reproducing the business and taking their present worth.

Mr. BYERS: My only objection to that is having counsel state the witness' position and then have the witness assent to it.

A. I have.

Q. In order to make this entirely clear will you please state whether in measuring going value by your method you have taken into account any of the losses which the Des Moines company, the existing company may have incurred in its early history or
1548 prior to this time in building up its business or as Judge Carr suggests very properly in addition to that do you confine your losses on account of operation, do you take into account those which will ensue hereafter in reproducing the present earning capacity?

A. I did not take the early losses into consideration, but approached this problem as an engineer and confined myself to the difference in estimated earnings of the going and comparative plans as indicated, measuring cost of reproducing going value in that way.

Q. Now to digress for a moment, I am not sure whether you testified on your direct examination as to what in your judgment was the proper amount to charge against the operating for depreciation and if not will you state what it is?

A. I believe a fair and a reasonable charge in the case of the Des Moines company is a charge which is computed on the basis of ten cents per thousand cubic feet of gas sold per year.

COURT: I don't get that. I wish you would explain more fully what you mean by that.

A. You don't care for me to go into the entire explanation again how I arrived at that.

COURT: No, just what you mean.

A. Well the Des Moines gas company in the year 1910 sold in Des Moines 525,101,954 cubic feet of gas. Now to determine a proper charge in my judgment for the amount of money to set aside during the year 1910 for depreciation I would reduce that to thousands of cubic feet, namely, 525,101 and then the depreciation would be $52,510.19½.

COURT: That is the money you would want to put at interest for depreciation?

1549 A. Yes, sir; in the year 1910.

Q. Now to indicate perhaps why you do it in that way, I call your attention to Exhibit 16 and ask you to state to the Master whether in the gas business it is customary to figure all of these costs per thousand cubic feet?

Objected to as incompetent and immaterial.

A. It is usual and customary to reduce these matters to per thousand feet of gas.

Q. For instance you have perhaps thirty or forty items there?

A. Yes, sir.

Q. That go into the operating cost here?

A. Yes, sir.

Q. And each one is treated that way?

—. It is.

Q. What do they call this in the business?

A. Usually called per M's.

Q. Or pers.

A. Or pers.

COURT: That means one tenth of the amount of gas goes for depreciation?

A. In a case your honor where the gas is sold at a price of $1.00 per thousand, it would be one tenth. In a case where it is sold for $1.10 per thousand the charge would be ten cents but it would be one eleventh.

COURT: That is without regard to the price of gas?

A. Yes, that is without regard to the price of gas.

Q. Now returning to going value for a little you were asked on your cross examination if the percentage of increase in the business which you estimated for the next four years was not lower that for the immediate preceding four years and I believe you said
1550 that it was.

A. Yes, sir.

Q. If you had made this estimate of the gas to be sold during the period of reproducing the income higher, how would that have affected the result in going value?

A. You are referring now to the time of the development of the going plant?

Q. Well it don't make any difference because both plants must get together.

A. That would result in a somewhat increased going value.

Q. Your attention was also called to the fact and you were asked to make a computation showing that the numercial average of the per cents of increase for four years in the hypothetical plant I believe was 68.92.

Mr. BYERS: The comparative plant in this case?

Mr. GUERNSEY: I would as soon call it that, I mean the same thing. Now if you had assumed that this business had been reproduced less rapidly how would that have affected the ultimate result of your going calculations.

A. That would have resulted in a material increase in the going value.

Q. Now I wish you would turn to your report and tell us how many meters there are installed and using gas in your assumption in the first year?

A. In the year 1911 it is estimated that no——

Q. I mean the first year that you begin to operate?

A. In the year 1913 which is the first year of operation it is estimated that 80 per cent of the meters in District No. 1 only would be installed and 30 per cent of the meters in District No. — on the average and none in District No. 3.

1551 Q. That is in the first year 1913?

A. Yes, that is the average figure as of July 1st.

Q. Can you tell me in meters how many that would be?

A. I would have to figure that.

Q. You can do it in a moment can't you?

A. Yes, sir.

Q. That means in District No. 1, about 7600 meters and in District No. 2, 1870 meters and in District No. 3 none, this being the average number of meters in use in these districts on July 1st of the year 1913.

Q. That was 7600 and 1800?

A. 1870 or a total of 9470. That is not accurate to a decimal.

Q. For the next year where you have such a big increase in percentage, how many additional meters are added?

A. The next year in District No. 1, that is in 1914, it is estimated

that 100 per cent of the meters would be in use or 9501 an increase over the preceding year of 1901 meters. In District No. 2, the number of meters would be about 5000 or an increase of 3130 and in District No. 3, about 2076 where there were none the year before making a total increase of 7100 meters approximately.

Q. And during this same period tell us whether you assumed that the number of meters of the going plant would increase in the same ratio?

A. I certainly assumed that the going plant would increase from year to year the number of meters.

Q. What I want to know is whether it would practically double in a year.

A. Not at all. The increase in the going plant would be very small compared to this.

1552 Q. You were asked some questions on your cross examination which assumed that the income or the net revenue of the going plant last year was $175,000 without taking out depreciations and about 122 or '3 with depreciations out and also included some estimates as to the computations as to what return this would afford on your valuation and was asked this in connection with your determination of going value. Now I wish you would tell the Master what income you assumed to reproduce in measuring this going value?

A. The actual income of the Des Moines Gas Company as of the date of this valuation.

Q. And what is the fact as to whether these are the actual income figures used in making this computation?

A. I did use the actual figures of the Des Moines company as given to me.

Q. And if the income were higher and afforded a higher return on the value of the plant how would that affect your going value generally?

A. Generally it would increase the going value.

Q. You were asked a question on your cross examination as to the use of brick of a poorer quality when these buildings were built than common brick is furnished now. I wish you would state whether in your judgment if the brick used in the buildings had been of a poor quality that would manifest itself in their per cent condition?

Mr. BYERS: That is not a very competent question.

A. I think undoubtedly it would.

Q. And if the brick had been of a poor quality, how would that have affected your estimate of the depreciation which I under — you is based on actual inspection.

1553 A. It would have caused a decrease in my estimate of the present value.

Q. I think at one time during your cross examination Mr. Baehr you stated that you had devoted your entire time up to April 1st, 1909 to the operation and construction of gas plants. Elsewhere you stated you had made quite a number of inspections and valua-

tions of plants prior to that time. Which of these statements is accurate?

A. The statement as I gave it in my qualifications is accurate.

Q. Now you were asked whether Mr. Klumpp had been here checking up and you said you did not know. What did you understand this question to mean?

A. I took it that it was intended to mean or to ask whether Mr. Klumpp was here checking up my report or not.

Q. What if anything has he had to do with your report?

A. He may have seen it, but that is about all, but he has not done anything with it because I did not allow the report to go out of my possession until the day I came to court.

Q. Now you stated in connection with your cross examination that the company furnished you a copy of Exhibit 15 which is the volume of the inventory which contains the quantities and the specifications of the various kinds of material. Please state whether or not you were also furnished with a copy of the other volume, Exhibit 16 or with copies of the plans which are contained in it.

A. I was also furnished with a complete set of blue prints or plans as you call them which are contained in the exhibit referred to.

Q. You have produced here and there have been identified as Exhibits a number of papers containing information relating to the history of this ppant. You also produced a letter that
1554 has been read into the record which gave some figures that were given to the gas company by a contractor stating prices at which he would replace some paving. Now I wish you would describe in just what way you used this information in making your estimates.

A. Such information as that letter referring to cost of restoring pavement, the cost to the company of purchasing cast iron pipe, the cost to the company of specials, cost to the company of laying services I use as one of the factors upon which to base my judgment for the purpose of placing a value on this property. I did not take the exact figures in any instance that I know of. In fact I don't believe I took the figures in a single instance. I used it as one of the factors on which to base my judgment, predicating my judgment very largely upon my experience in the business.

Here the further hearing was adjourned until 9:30 a. m. tomorrow.

1555 Thursday Forenoon Session.

AUGUST 3, 1911, at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of complainant resumed as follows:

WILLIAM A. BAEHR, re-called for further re-direct examination, examined by Mr. Guernsey, testified as follows:

Q. I wish you would turn to your report, Exhibit 21, immediately following page 149 you stated that you made some adjustments

in the operating cost for 1910 on account of Valley Junction which resulted in reducing the total as shown on this page from .5908 to .5897. Now the total operating as shown on this page, not including taxes and depreciation, is how much in dollars for that year?

A. The total operating expense is as I have shown it not including taxes and depreciation $314,328.77.

Q. Now what would be the difference—what does this difference cost by your adjustment of these matters amount to in dollars?

A. Approximately $2,160.

Q. You have been asked with considerable detail as to various conferences in Chicago and perhaps elsewhere. Now I wish you would state generally, without going into the details of these matters, Mr. Baehr, whether there was any effort made by anyone in those conferences or at any other time to influence or affect your judgment as to the value of this plant?

A. There was not.

Q. Also please state whether in making up your valuation you have acted entirely upon your own judgment as to the fair value of this property?

1556 A. I have.

—. Now, on your cross examination your attention was called to a number of things, all of which you said were considered by you and were of more or less importance in making up the valuation which you reached, or your conclusion as to the value of this plant and including the history of the price of gas in Des Moines, some blue-prints that you have produced here and have been identified as exhibits, the report of the annual gas scales, the holder cost of gas, the gross revenue of the company for a considerable period and its operating expenses for a considerable period, its net earnings, taxes paid by it, its annual gas sales, population of the city of Des Moines, manufacturing cost and consumption by meters. Now aside from the matter of taxes, as to what item of your report were these factors that I have referred to considered by you to be material?

A. Those items I used in connection with the going value calculation.

Q. And aside from taxes, did you use them in any other way in making up your report?

A. I did not.

Q. Or in reaching your conclusion as to value?

A. No.

Q. The taxes you used both in the going value and in the other items?

A. I did.

Q. Now, then, I think you have stated that these things and the other things furnished to you were used by you as checks or guides to your judgment in arriving at your various unit prices or other factors which you used in making up your valuation; is that a fact or not?

A. That is true.

1557 Q. Now, in looking over the transcrip-, I see on page 1392, at the top of the page, referring to the Western United Gas & Electric Company, you say this latter company owns or controls

the property at Elgin, LaGrange, Aurora and Joliet and I think about smaller villages in that neighborhood. Now what was the number of smaller villages you referred to?

A. About twenty.

Q. Now, in the question that begins on the fourth line on page 1409 of the transcript it is said that if several engineers were to deal with this property for the purpose of arriving at a valuation you would want to know before you started where you were all going to end, and you answered "I would think so." I call your attention to this and ask you whether there was any concert, or attempted concert among the engineers as to the value which they were to arrive at?

A. None whatever.

Q. Now at the top of page 1423 I notice this question: "And the history of the price of gas you regarded that as important?" Answer, "I did." On what subject was that important?

A. That was a mistake on my part. I did not consider the history of the price of gas in connection with my calculations.

Q. With reference to cast iron pipes you gave some prices, running four or five years, as you obtained them from the company here. In the first place, is this information that is available from other sources, the price of cast iron pipe?

A. Cast iron pipe—there are market quotations available pretty nearly all the time.

Q. And the prices in the various localities vary with the freight rates?

Objected to on part of defendants as leading.

1558 A. The prices in the various localities vary with the freight rates.

Mr. BYERS: A large part of the examination is simply your statement with the assent of the witness.

Mr. GUERNSEY: I have assumed there was no objection to a question there was no possibility to dispute.

Q. I will change the form of the question then. Now after you had obtained this information, please state whether you took the average price which the company had paid for these five years, or some other price which in your judgment was a fair one to apply to the plant.

A. I took an entirely different price, which in my judgment was the correct one to use in this work.

Q. Now, Mr. Baehr, you have been asked whether as to a great many of these things you regarded them as important in making up your estimate, referring to these matters ascertained from the books of the company as distinguished from your experience in the business. In that connection I would like to ask you of what value in your judgment an estimate would be that was made up from statistics and was not predicated upon actual experience in the gas business?

Objected to on part of defendants as being incompetent, immaterial and not a subject of expert testimony.

A. I would consider such an estimate worthless.

The MASTER: Speaking about pipe here, is that the ordinary cast iron pipe; have you got any standard weight per foot?

A. There is a standard weight per foot for the different sizes gotten up and adopted by the American Gas Light Association and gas companies in ordering cast iron pipe specify usually the stand-
1559 ard of the American Gas Light Association.

The MASTER: What is the standard weight?

A. I can give you that——

The MASTER: Say for six inch?

A. Six inch pipe, standard weight is 30 pounds per lineal foot.

The MASTER: Four inch?

A. Four inch, 19 pounds.

The MASTER: For 8 inch?

A. 42 pounds.

The MASTER: For ten inch?

A. 56 pounds.

The MASTER: For 12 inch?

A. 12 inch is about 72 pounds.

The MASTER: 16 inch?

A. 108 pounds.

The MASTER: 20 inch?

A. 150 pounds.

The MASTER: 24 inch?

A. 203 pounds, as I have it. Now I haven't got the figures in my book of the American Gas Light Association standard and I have deduced those weights by the use of a sliding rule and it may be I am off a fraction of a pound.

The MASTER: These are not the weights you figured?

A. No.

The MASTER: Can you ascertain the excess of pound by taking those figures?

A. I have added two per cent for over-weight. From my experience I have found that cast iron pipe runs two per cent or more overweight of standard.

The MASTER: You figured these as standard?

1560 A. Yes, sir.

Q. Does that include pipe as laid in the main, shoulders and all?

A. It does.

The MASTER:

Q. So that gives how much you allowed per pound; you used it as you give it?

A. Yes, if you add the two per cent.

Q. That is, if those figures—if I understand you—were taken and applied to the inventory, the lengths of the various sizes of pipes as given in the inventory, with two per cent added, how would that compare with your total weight of pipe?

A. That ought to check out exactly or as close, within several decimal points to the weights I have used.

Q. Now, on your cross examination I thought that you emphasized the word actual in talking about the number of brick in a wall. What significance do you give to this in your testimony, how does it differ from the ordinary estimate?

A. Various contractors have various methods of figuring brick work. Some contractors, for instance, figure a wall as solid, without deducting the openings for windows and doors. Other contractors make certain deductions and it is rare that two contractors figure just exactly alike on that subject. Now all my figures are based on actual number of brick, making the most careful computation of the actual number of brick there are and my price that I have used is figured accordingly.

The MASTER: Brick masons double it in turning corners?

A. They have various ways of doing it. I don't know how they all do it. In talking with a number of them I found different methods of calculating and I found it difficult to get them to tell me just what they did do.

The MASTER: You figured counting out openings?

1561 A. Counting out the openings and allowing for projections, etc.

Q. You were asked on your cross examination whether during two or three years of this five years for which you were giving the price of pipe this price was not high. Now this period began when, this five year, for the price of pipe?

A. Beginning with 1906.

Q. Now what effect did the panic of 1907, when we were on a clearing house basis in October, have on the price of pipe?

A. The prices of cast iron pipe were high during 1907 until the latter part of that year when the panic became acute, the prices then began to drop and became low during the succeeding year.

Q. How have they been since then?

A. They have never been as high as they were just prior to the panic.

Q. You spoke about computing the cost of the additions which it would be necessary for the company in your judgment to make to the plant in the near future on a percentage basis, but I think you did not explain what that basis was. Will you please do so.

A. I used the percentage basis in connection with my estimate of mains, services and meters. In my judgment the increase in investment in mains will be about thirty per cent during the next seven years, and I took thirty per cent of my estimate of the reproduction value of these mains as of date of this valuation. Now in connection with the meters and services I estimated that the population would increase during these seven years about twenty per cent—about twenty-three per cent—and I applied this percentage to the estimated cost of the meters and services. In that way I arrived at my estimate.

Recross-examination by Mr. BYERS:

1562 Q. Now, Mr. Baehr, last evening for the first time during your entire examination, and after counsel had stated to you that you figured out the going value in this case on prospective and

future losses, rather than early losses, we reach an understanding of your method. Now was that because you was uncertain yourself as to just how you proceeded, or was it because I did not put the question to you in such a way that you knew what I was trying to get at?

A. I think the difficulty was in arriving at an understanding between you and myself.

Q. You understood me when I was talking about early losses, didn't you?

A. I don't remember what the condition was at that time, Mr. Byers.

Q. Well, now, Mr. Baehr, since Mr. Guernsey told you what your method was in his re-examination, and you assented to it, do you want to take back what is written in your report?

A. No, sir; I want to stand on my report.

Q. Now, what you have written in your report does that square with the method Mr. Guernsey tells you you adopted?

A. If you will kindly call my attention to the portion of the report you refer to, I will see.

Q. I refer to all of the explanatory matter of your report as to how you arrived at the going value.

A. That explanatory matter did not detail my method of estimating going value at all, because I stated clearly in the beginning. at the bottom of page 15 as follows: Now what will it cost to develop the business of the conceptional plant to exactly equal that of the actual going Des Moines Gas Company? The answer to this question is figured in our calculation as herein and we feel the foregoing viewpoint will serve to greatly simplify the principles
1563 that control this question." Now that explanation did not in my opinion, and does not in my opinion explain the method that I used for arriving at my judgment of going value.

Q. Well, then, why didn't you explain it promptly—was it necessary for you to wait until Mr. Guernsey stated it to you before you would tel- us?

A. I tried to answer your questions, as I understood them, Mr. Byers.

Q. I spent a half a day trying to find out from you just what method you pursued in arriving at going value and you at no time mentioned the fact that you proceeded on the theory of future of prospective losses as stated to you by Mr. Guernsey.

A. That must have been due to a misunderstanding on my part, Mr. Byers.

Q. Well, so we have an understanding now. Your whole scheme then of going value in this case and the amount of $509,000 that you have figured out here rests entirely upon your judgment as to what the losses would be in constructing now a gas plant here and operating it over a period of say seven years?

A. You would have to add to that that it is my estimate of what it would cost to reproduce the condition as of January 1, 1911.

Q. I know—I am trying to get away from the cost now, because that is not the word you used and that is not the word Mr. Guernsey

used, and I don't want to be confused about this matter of going value because it is worth something to me to know all about it. Mr. Guernsey used the word losses and I want to know whether that is what you understand your method to show, the losses that would result to the promotor or builder of a comparative or hypothetical gas plant in this city and operate it over a period of seven years?

1564 A. I think I can make that clear to you by stating that the figure I have arrived at is my judgment of what it would cost or what the loss would be to reproduce the business that the Des Moines Gas Company has and is doing as of January 1, 1911.

Q. Well, now you use both terms, which do you mean, losses or cost?

A. I use them in a synonymous sense, as meaning the same thing in that sentence.

Q. How do you apply cost to this $509,000 value that you got into this old plant, how do you get it into the going plant in the shape of cost?

A. It is merely my estimate—I will use the word losses this time because I see that perhaps I have not made myself clear there. It is my estimate of the losses that would be incurred in reproducing the business as of date of this valuation.

Q. Well, then, with that understanding, let me see if I have the right notion of your attitude and your understanding as it relates to this case. Now if you have proceeded on that theory that this $509,000 is the amount of money, or the amount of return on investment that would be lost by a prospective builder of a gas plant in this city and operating it for a period of seven years, beginning with the first day of last January, and does not have any application to any other plant, why then I understand you?

A. Maybe I can express it in still another way that might be of service—put it this way: The revenue of the Des Moines Gas Company was so much on January 1, 1911, and my figure on going value is my judgment of what it would cost to reproduce that.

Q. Yes, in other words, this $509,000 you have said in your testimony numerous times, said it to Mr. Guernsey and to me, that this $509,000 attached to the value of the Des Moines Gas Com-

1565 pany property. Now, if I understand you, that is not what you mean at all—that all you mean is that if a prospective builder or investor was to start out here in Des Moines on the first day of January to reproduce a similar property to this property now being operated by the Des Moines Gas Company, that prospective builder in a period of seven years, as compared to what the Des Moines Gas Company is making, would lose $509,000 and therefore there would be that much in his comparative or prospective plant that would be carried on into its operation beyond the seven years and be a part of that prospective comparative plant's value—that is what you mean, isn't it?

A. I would like to modify that slightly because I consider that the revenue of the Des Moines Company attaches to the property of the Des Moines Company.

Q. Oh, yes; I am not questioning that at all.

The MASTER: What do you mean by revenue, net earnings?

A. The gross revenue in this instance.

Q. I am not questioning that at all, but what I am trying to bring out clearly now—it has not been clear to me, may have been to everybody else—is the fact that so far as you are concerned, your attitude, your plan and method is concerned here, it has nothing whatever to do with the Des Moines Gas Company's experience of losses or their property, except that you have used it as a comparative or a part of your comparative proposition of building a new one, and you have simply used the Des Moines Gas Company's figures, their gross revenues, their net revenue, their operating expenses, their apparatus, the number of miles of mains and meters and services, and all that sort of thing—you have simply used these figures for the purpose of fixing the limit to your new and comparative plant
1566 that is in size, quantity, quality and number and in business, revenue and so on, and then with that as a comparison to your new plant you figured out from your standpoint that a prospective builder would have in his plant at the end of seven years this $509,000 in going value; isn't that exactly what you mean?

A. I have based this calculation on the facts, that is, the business of the Des Moines Gas Company as of the date of this valuation.

Q. Just as I have stated it. You simply used those figures I mentioned of the Des Moines gas property as I mentioned them, you simply used those for the purpose of a limit or plan or specifications and plans for your new plant, and that is all?

A. No, I used that method of calculation to arrive at my estimate of the going value of the actual Des Moines Gas Company.

Q. You do not mean to convey the idea to the court or any of us that this $509,000 is money that the Des Moines Gas Company, or value that the Des Moines Gas Company has put into this plant at some past time or covering some past period—it didn't represent anything of that kind?

A. I mean that is the amount of money it would cost to reproduce the business as of that date.

Q. And that is all you do mean?

A. I further mean it is my judgment of the proper amount.

Q. I know, to go into this comparative plant, but you do not undertake to say to this Master, and all along where you have said so, you would want it modified by your present statement that you know anything about the losses of the Des Moines Gas Company, or how it produced its business or how it got it, or how much money it put in it, or what it cost the Des Moines Gas Company to get this
1567 property, you don't know anything about those things, do you?

A. I haven't got the data on those things, but as I stated before, this amount of going value which in my judgment is fair, is my estimate what it would cost to reproduce the condition.

Q. Exactly, I thoroughly understand you when you put it that way, because that puts an entirely different phase upon the whole

question. Let me put this question to you and see if that don't bring out very clearly what I have in mind: Suppose you had two cities exactly like the present condition in Des Moines, that is, you have two cities with the same population you have in Des Moines, with the same conditions as to education and all that sort of thing, everybody educated up to the use of gas in both cities, they are both exactly similar to Des Moines; now you were going to build a gas plant in one of the cities, and I want you to assume that all other conditions are just alike, freight conditions and climate, seasons and everything else, so that there can be no complication in the property; you commenced on the first day of January, 1911, in one of those cities to build a gas plant; now if you should proceed on the theory that you have figured out here to build your prospective plant and should carry it out and it should work out according to your method and plan, and you put into it the amount of money you have estimated here, and at the end of the seven years you had reached exactly the state you say you do on the paper here, your report, in your plant, would you have then $509,000 of going value in your plant?

A. Yes.

Q. Now, suppose that the other fellow had proceeded to build exactly the same kind of plant that you talk about and he would
1568 get his plant to going in that city and selling gas a year and a half before you did yours; there would be an entirely different situation as to the going value in his case, would there not?

A. That would result in a different figure.

Q. Very different, if he got started a year and a half before you did in the sale of gas and ran seven years as you say your plant run, all other conditions being alike, his going value would be reduced very much, wouldn't it?

A. If I understand you to mean by that that the comparative plant would catch up to the going plant in less than seven years—

Q. We haven't got any going plant here. Here is two cities without any plants. The only comparison is between your new plants; the one fellow has got his going a year and a half before the other, serving the population that uses gas.

A. The basis of this calculation is a comparison between the going plant and the comparative plant.

Q. I mean you have got no plant now.

A. That is a different proposition; if you are starting to develop the business in an entirely new city, that is where there is no gas company—I am trying now to get myself to see just what you have in your mind—and if you assume that there are two such new cities and one develops business faster than the other, without comparing the condition in either of those hypothetical cities with the actual company or actual city, I am not so sure that that would make a material difference in the going value.

Q. Then if I understand you, you cannot have going value unless you have some plant to compare with the one you reconstruct in your mind, is that right?

A. In order to have going value I figure that a company must

be doing business and the entire calculation rests on a com-
1569 parison between a going and a comparative plant based on actual conditions?

Q. Well, this fellow is going a year and a half before you are. Let us take it another way: Here is a city just like Des Moines, conditions all the same, everybody educated up to the use of gas, no difference in any other respect, except that this city I am speaking of now where you are to build your comparative plant, there is no gas company and no gas property in existence, but everything else is there, the same number of people that there is here in Des Moines, and they have the same education as to gas; now here is another city exactly the same in all respects, except that it has a gas plant in operation just exactly like the Des Moines gas plant, in every respect as to mains, apparatus, real estate, service, fixtures and the whole business exactly like the Des Moines Gas Company; now we are just beyond the first day of January, 1911, just at that date; along comes an owner of the Chicago Gas Company and he buys this gas plant in the city where it is operating for exactly $2,000,000 not a cent more, not a cent less; buys it from the owners for exactly $2,000,000. Now on the first day of January 1911, the same date that he buys this plant, you commence the construction of your comparative plant in Des Moines or in this city with the conditions the same as in Des Moines, and the Chicago Company goes right on operating their plant, just exactly the same as this Des Moines Company will go on, as you figured it out, how much going value would the Chicago Company that paid exactly $2,000,000 for their going concern, how much going value would they have in their plant, worked out on your theory?

1570 A. If I understand your proposition correctly, that resolves itself exactly into a comparison between an actual going gas company and the comparative plant as I assumed it.

Q. That is an actual going plant; the other you are building yourself; you are going to build this plant you worked out on paper here, if you work out your scheme just as you got it in your book, when you reach the end of your seven years, on your theory you would have $509,000 going value in your plant; you would have that much according to your theory in your plant, wouldn't you?

A. Yes.

Q. What I am getting at is that would not be putting it in anybody else's plant unless they had exactly the same experience you had.

A. I think that comes right back to the proposition that it is a fair estimate of what it would cost the other fellow to reproduce it.

Q. The other fellow don't have to reproduce; he is running, he has got his plant?

A. But wants to know what it is worth.

Q. He don't. He just paid $2,000,000. He don't have to have anybody tell him what it is worth.

A. I don't see that that resolves itself in a parallel proposition to this at all.

Q. You don't?

A. No, sir.

Q. Well, now, Mr. Baehr, I wish you could, if you would, for a minute get out of your mind the fact that you are a witness for the Des Moines Gas Company case, and that there is any question now of sustaining your theory or anybody else's theory, and just
1571 give me as brief an answer as you can to this one proposition, and that is whether it is not your theory and your understanding and is your own plan and method of figures, that all it has to count for or weigh in this case, is that it is your judgment that if a new plant was constructed here like the Des Moines plant under the plan that your worked out, and covering the period you have stated in your book, that there would be $509,000 of what you call going value in that plant?

A. I don't understand it that way, because I am basing my entire calculations on the conditions of the Des Moines Gas Company.

Q. Well, let's put it another way, Mr. Baehr, if you don't understand it that way: Suppose that at the end of the seven year period, instead of the beginning of it, you had actually gone on and carried out your hypothetical scheme here, where would this $509,000 in value, so far as you are concerned, be in your plant, or the Des Moines plant?

A. In referring to my plant, you mean comparative plant, and further assuming that $509,000 in round numbers was spent in developing the business, if I was asked at the end of the seven year period to place a value on such plant I would figure what it would cost to reproduce it at that time.

Q. No, you wouldn't; you would know exactly what you had put into your property at the end of seven years.

A. Even so, the question that would be put to me would undoubtedly be, what is it worth now.

Q. No, I am taking just the plant you worked out; suppose we were at the other end of that period and you were trying to figure out for this Master, just as you are now, just how much money you had gotten into that plant, what its reproduction cost what that total cost was, covering all those items you mention,
1572 you would state to the Master that it cost in addition to what you paid for pipe and all that sort of thing, this $509,000, and therefore you would say it was worth $509,000 more than just the reproduction cost of the physical property?

A. If the Master asked me what it would cost and that was thamount of money I had spent, I would say yes.

Q. And therefore and because it did that, you would say it was of that value, wouldn't you?

A. No, sir; that is where we don't agree apparently.

Q. Would it be worth more?

A. I have it clearly in mind that the value at that time might be considerably different from what it cost.

Q. Is that so—then what becomes of your plan for use in this case if you haven't figured it out right?

A. I might try and illustrate my idea on the question—supposing I had bought a piece of ground a good many years ago and paid

a thousand dollars for it, and it subsequently rose in value and would be worth five thousand dollars, I wouldn't sell it for a thousand dollars.

Q. Is that the way you mean it might be worth more—you have already tried to figure out to this court and anticipated seven years in the history of this city; you figured out what you think it *it* would cost to reproduce the property like the Des Moines Gas Company?

A. I see where your difficulty is.

Q. You see where your difficulty is?

A. I have reduced those future net earnings to their present worth and it is the estimate as of January 1, 1911. These future earnings have been reduced to their present worth and therefore the $509,000 in round numbers does not result from taking the
1573 actual difference of the actual earnings each year, but it results from the difference of these earnings reduced to their present worth.

Q. That doesn't affect the proposition at all. That simply makes your present figure $509,000, the difference between that and what that would be worth seven years hence. It is the principle I am getting at. You would at the end of seven years, if you were putting a value on your property, all conditions being just as you anticipated, you would work out this going value just as you have in this report, wouldn't you?

A. If you mean to say that I would take cost and use cost, that is one thing, but I didn't do that. Maybe I don't understand you, at least that is what I did not do; I did not use cost, I attempted to place my value on my judgment what it would cost to reproduce it at the time.

Q. I will state it once more, and then I will leave it. I am just as anxious to get it right as I can be, not only for my own account but on yours. I want the record clear. Assume all conditions just as you have anticipated in this computation you have made here as to the comparative plant; assume that it works out just as you figured it; you built the plant, actually built it as you figured it out here; we are at the end of the seventh year instead of at the beginning; leave out of your mind this question of $509,000 as the present going value item, but consider that as the going value at the end of the seventh year, if you were asked to put a value on the plant you have just constructed, upon the plan you set out here in your report, all other conditions being exactly as you anticipated them, what would you tell the Master was the value of your plant?

A. Well, if you predicate the condition that I am to
1574 consider that amount of money as the going value at that time, that seems to me to be the answer.

Q. How is that?

A. In your question, as I understood you, you said to me to consider the going value at the time that you have in mind as being in round numbers $509,000. Now if you are asking me to consider that, that would be the answer.

Q. No, I didn't mean that at all. You have undertaken to figure out the going value of a plant, the construction of which commenced

the first of January, 1911, and you carried your figures up to a period of seven years hence in comparison with the going plant of similar character operating over the same period, and you have arrived at a sum that you say would be the going value—I don't remember what it was as you figured it out before you reduced it to its present value, but letting the question rest upon the figure as you figured it out, without reducing it to its present value, and you are at the end of the seventh year period instead of at the beginning of it, and you work out your scheme just as you state in this report, and the Master at that time was to ask you for the value of your plant on the assumption that everything was just as you anticipate it, what would you tell him was the value of it?

A. I don't believe I can answer the question, Mr. Byers.

The MASTER: You figured first the earnings of this present Des Moines Gas Company up to the end of the seventh year?

A. Yes.

The MASTER: Then you constructed the comparative plant over that same period and figured what its earnings would be during that period under like circumstances?

A. Yes, sir.

1575 The MASTER: And then you ascertain the present value of that?

A. Year by year, yes sir.

The MASTER: And that present value is the difference between the going plant and the comparative plant without regard to the question of whether the going plant is getting a net income or not.

A. It is the net income possibly as you have it in mind that *are* being compared.

The MASTER: The net income is being compared?

A. Yes, sir.

The MASTER: Not the net earnings?

A. I want to be sure, to be perfectly clear on that, I will state as well as I can express myself, just what I mean. We are comparing what I call the net earnings reduced to their present worth, and by net earnings I mean the gross revenue less the operating expenses, less taxes and less depreciation; that is what I call net earnings. Now I am taking the going plant and the comparative plant, I am taking these net earnings year by year and reducing them to their present worth, taking the difference and add the sums of this difference over the period under consideration, seven years, and that sum, in my judgment, represents what it is fairly worth to reproduce the business of the Des Moines Gas Company.

The MASTER: That is to reproduce the business?

A. Yes, sir.

The MASTER: Starting and building a new plant covering that seven years?

A. Yes, sir.

The MASTER: I understood you yesterday you did not take

1576 into consideration the net income of the gas company at all.

A. This whole estimate is based upon a careful study of the gross

income and operating expenses and the net earnings of the Des Moines Gas Company.

The MASTER: That is the difference between the two plants?

A. The two plants are compared on a basis of the net earnings between the two plants; in other words, what a man would make out of them after paying operating expenses and depreciation.

The MASTER: But you don't take into consideration whether or not the present company is earning a reasonable return on its physical value?

A. I am not paying any attention to the rate of the return in this calculation. This is based entirely on the present rate for gas as of January 1, 1911.

Teh MASTER: You do not take into consideration whether or not it is earning what may be termed a reasonable income on its present physical value as you make it?

A. No, because all I am trying to do is to reproduce the condition as it was on the date of my valuation.

Tehe MASTER: It is altogether predicated on what is known as the reproduction idea in getting your valuation?

A. Yes, sir.

Q. Now, I want to put another question. I don't think I misunderstand your positions at all—I don't want to put you in the record in a way that you would not be satisfied with it after you got through with this case. Now let us assume a little different situation than what we have here. Assume, if you will, for the purpose of this question, that the Des Moines Gas Company began its operation in Des Moines seven years ago; assume that all the con-
1577 ditions now necessary to an immediate sale of gas, that is education and a knowledge of the use of all these different gas appliances existing in Des Moines seven years ago; now the Des Moines Gas Company begins its operations on the first day of January, seven years back; just as — commenced to build your new plant, they commenced to build the present in the city of Des Moines; now they have continued down to the end of the seven year period, we will say, the first of last January, they were right at the end of the seven year period; now if you were asked as an expert engineer to take the Des Moines Gas Company as a real thing, just as it existed, and pay no attention to this prospective or future method that you have used here, but if you were asked to fix a value upon the property of the Des Moines Gas Company on the first day of January, after its seven years of operation, basing your valuation upon the actual operation of the plant itself, how would you proceed?

A. I would proceed just exactly as I did.

Q. I say, leave that out of it entirely now, this new method you have used here, just take the actual operation of the plant, take the actual experience, the amount of money put into it and all that sort of thing, if you were asked to ascertain for them just what the property has cost them to produce it during those seven years, would you get any going value in it, and if so, how?

A. I don't believe I could say that I could figure it the way — predicate that.

Q. Wouldn't the actual experience and the actual building of a plant and the actual expending of money, the losses and return and all that apply to a going concern just as well as to a hypothet-
1578 ical proposition?

A. I think you inject another factor there that I have not considered, namely, the rate of return.

Q. You have not considered that at all?

A. No.

Q. I don't care whether you considered it even now, take this actual plant and start back seven years ago, if you did not adopt this reproduction plan of building in the future comparative plant, how would you proceed to ascertain just how much the Des Moines Gas Company had put into its property and upon which a return ought to be based, whether it is a fair one or not?

A. Well, if somebody undertook to assume the responsibility of saying to me what a fair rate of return was, I might be able to base some sort of a study by which to arrive at the losses.

Q. Somebody did undertake to tell you in this case?

A. No, sir.

Q. Why did you use the rate you did use?

A. I didn't use a rate of return in my calculation.

Q. Don't you call interest a return on money?

A. Interest is a return on money, but is not to be confused with a fair return on the investment of a public service corporation.

Q. Didn't you notice in this confidential communication we had trouble with here the other day, that statement, didn't you notice this interest suggestion here "interest during construction" the interest to be allowed during construction of the manufacturing plant and the distribution system of the Des Moines Gas Company consists of such amount as would pay for the use of the money during the time it is employed in the development of the property before the plant itself is on an operating basis, figured at six per cent. Didn't you notice that very clear and definite information as
1579 to return?

A. I did not. I did not pay any attention to that pamphlet, if I may call it so, except the one tabulation which I referred to yesterday giving a statement of the number of meter installations by years.

Q. You have some exact duplicated of it of tables in your report?

A. If there is any duplicate of that in my report I don't know it.

Q. How did you come to use six per cent interest?

A. Because I considered that a fair figure for general interest rates in Des Moines.

Q. By that you mean a fair return on the money in Des Moines?

A. Don't misunderstand me to say that I mean a fair return on money invested in the Des Moines Gas Company.

Q. No, you considered that a fair return on money in Des Moines?

A. I considered that simply as market interest rates.

The MASTER: Did you take into consideration the fact that the taxes were deducted from the real estate, the way you calculated it?

A. I deducted the taxes from the revenue of the company as one of the factors to determine the net earnings, if I understand what you mean.

Q. Well, now, let us get back to our question again. Seven years ago the Des Moines Gas Company commenced to build a plant, and suppose you would follow that progress right down to the first of last January, and in following it you would discover that these different items of added cost, that your judgment convinced you would have to be put into the construction of this prospective or future plant, was only about a third or one fourth as much as you figured, that would reduce the going value of the plant at that time to a
1580 third or one fourth, wouldn't it?

A. I don't know whether our minds are together on this subject or not.

Q. I am afraid not, at least we are not trying to get at the same thing. Let me put it in another way: If the figures could be shown here, showing the construction and operation of the present Des Moines plant, the beginning of it the first of January seven years ago and running over this seven year period, just as you done in your new plant, and you were to figure everything that the company did, all the money it put in, and what it earned and all that, and then at the end of the seven years the result showed that the Des Moines Gas Company from within six months of the time it commenced its construction had received in revenue more than a fair return upon its money, all of it, every dollar, that went into the property it was operating, would that have any effect upon the question of going value as you understand that proposition?

A. I don't believe it would.

Q. All right, we will leave it that way.

The MASTER: There was one matter yesterday, this question of the amount necessary to set aside each year for depreciation you gave as ten cents per thousand cubic feet of gas?

A. Yes.

The MASTER: And the next year it would be ten cents on that?

A. Yes.

The MASTER: It would be ten per cent?

A. At a dollar rate it would be.

The MASTER: Do you know what the composite life of the gas company is estimated at?

A. In the case of the Des Moines Company, I can
1581 & 1582 give you the figure. I had figured the composite life of the Des Moines Gas Company's property, that is, considering the buildings, the apparatus, equipment and distribution system at 37.6 years.

The MASTER: Did you ever figure the amount set apart each year at compound interest for these thirty seven years at six per cent per year and ascertain what it would amount to?

A. I have not, but I have used that same method of figuring in arriving at my estimate of the fair amount to allow; that is I used the compound interest basis in two calculations, or two studies rather

and one study I made on the strength of my basis. I didn't figure the total dollars.

The MASTER: The first year it would be $51,000 and the next year say $55,000, and you take each of those amounts and figure them at compound interest up to the end of 37 years, it would make a pretty good sum of money?

A. I didn't make that calculation, your honor, that way.

The MASTER: It wouldn't take you long to do it?

A. I don't believe you would want me to do it here in court.

The MASTER: You would have to take each year for instance, the first would be 37.6 and the next would be for 36.6 so that you would have different amounts each year and larger amounts each year, as they go into the summary, and that at compound interest of six per cent or five per cent or four per cent, would make a large sum of money?

A. If my figures are correct it ought to take up just about the value of this property.

The MASTER: What rate of interest did you figure?

A. You mean the interest paid on that?

The MASTER: The rate of interest, six per cent?

A. I figured 6.4 per cent for 1911 and then a decreasing
1583 percentage until 1917, my estimate was 4.15; in other words, at a decreasing percentage.

The MASTER: You have one figure there where you put the amount at thirty-three thousand and some odd dollars and another at $38,000.

A. Yes, sir. I have figured on the straight line basis that the amount of money to set aside is $76,352, that is a proper amount on that basis. If you figure the compound interest at four per cent, then I figured the proper amount to set aside each year was $33,359.

The MASTER: From what you term a composite rate?

A. Yes, then that figure is $38,733.

Q. Right at that point there where you start with six and a fraction rate of increase and then gradually run down to four, that had to be done in order to get these two plants together in seven years.

A. No, sir; that is my estimate of what will take place irrespectively.

Q. You had to make that estimate in order to make that scheme work?

A. If I had used a larger per cent it would have resulted in a somewhat greater going value?

Q. If you had used a per cent lower than that what would have been the effect?

A. It would have resulted in a slight decrease.

Q. So that you have to have that sort of a graduated downward scheme in order to make your whole scheme work?

A. It is predicated on judgment based on the facts of the operation expense of the company.

Q. Did you have to make your figures square with the judgment?

1584 A. I certainly had to use my judgment.

Q. If somebody else had to use a different judgment they would not have come out at the same place you did?

A. One of the things about this method of calculation that is perhaps peculiar to it is the fact that if several men who are experienced in the business, who know the business, make calculations entirely apart from each other, they will perhaps naturally and undoubtedly differ some on the estimate of percentages of increase, but as a matter of fact it has been my experience in these calculations under the various assumptions provided they are reasonable assumptions, that the results harmonize very well.

Q. In this case there wasn't very much difference in the result of the engineers after their meetings together?

A. I havn't Mr. Lea's result; I don't know what he testified what was his judgment as to the amount of going value.

Q. There isn't enough difference to take an hour's time in this hearing. You heard him tell what his total- were the other day?

A. My impression is he said about $583,000.

Q. Now, Mr. Baehr, in this state the tax laws among other things provide that a merchant's property, the merchandise of a merchant, such property as is carried up here in the Gas Company's store, stoves and fixtures and lights, and all that sort of thing, is taxable upon the average value of the stock carried during the year, not on the amount on hand at any particular time, but on the average amount carried during the year. The statute further provides that manufacturing properties, the product of the factory, is taxable in the same way, that is, the product of a factory, the average amount

1585 of it, the average value for the year, not for any particular time, and all apparatus which in this case would include the machinery down here, the buildings, the mains, the services and everything, it all is a part of the hook-up, the machine becomes a part of the real estate for the purpose of taxation and is valued as a complete machine; have you proceeded in allowing your tax values on any such theories as that?

A. No, the theory that I have proceeded on is indicated in my report; I have given the detailed figures there.

Q. You figured out your tax proposition on the theory that all property, no matter what it is used for in Iowa or in Des Moines is taxable at two and one-fourth per cent of its actual value, that is the way you proceeded?

A. Yes, but in order to arrive at the taxes I also looked at the actual taxes that the company had paid in the past years, and in tabulating the amounts from year to year I saw that my allowance for taxes increased from year to year. But I predicated it on two and one-fourth full valuation, plus two per cent on gross income, plus federal tax.

Q. How much did you allow for the federal tax?

A. In the year 1911 I estimated that the federal tax the Company pay would be $795.29.

Q. How did you arrive at that?

A. From my going value calculation you will notice I have estimated gross income operating expenses, etc., and I followed the

rule which is laid forth in the federal corporation tax of taking the earnings of the gross income of the company and deducting the operating expenses, deducting taxes and depreciation, and if my memory does not fail me, the bond interest, and from what is left deducted $5,000 and then took one per cent of what is left.

1586 Q. That is the way you arrive at the federal tax?

A. Yes.

Q. You got how much for 1911?

A. I estimated the amount would be $795.29.

Q. Does that amount show in your report right along for each year?

A. Yes, sir, on pages 146 and 146½.

Q. Now, Mr. Guernsey asked you about this conference in Chicago and asked you whether anybody tried to influence your judgment and you said no, that you exercised your own judgment. Was there any difference of opinion among the engineers that met there as to what method ought to be adopted in this case of arriving at valuations?

A. The discussions, Mr. Byers, were a discussion of theories and interchange of ideas, and in my mind the discussion was entirely free from any attempt to influence my figures in any way.

Q. What was it for, what were they there for?

A. We were there I presume to discuss theories and interchange ideas.

Q. About valuation, was that the purpose of this meeting?

A. It was more on theories.

Q. I mean theories of arriving at valuations?

A. I would prefer to answer a question like that as applied to specific things.

Q. Who, at the first meeting of the engineers, first proposed the method of arriving at going value that you and Mr. Lea have adopted?

A. My recollection is there was no discussion of any kind at the meeting you mention about this going value method; that is my recollection.

Q. What did Mr. Alvord say about it?

1587 A. Mr. Alvord was not there, according to my recollection.

Q. You told me the other day he was?

A. Not at the first meeting; Mr. Alvord was, I believe, at one of the subsequent meetings.

Q. It was at that meeting he gave his theory and notion about this going value proposition?

A. We discussed the principles of going value with Mr. Alvord.

Q. You knew Mr. Alvord had advanced this same theory of arriving at going value that you and Mr. Lea had worked out before he was called in, didn't you?

A. I don't — how far before that I knew it or not.

Q. He told you himself that he had used that method or substantially that method here in the water case in this city?

A. I understood that he had used it in the water case and had been working on that for some time.

Q. Well, now, Mr. Haganagh was at one of those meetings?

A. For a very short time.

Q. He had just made up a report on the Chicago Gas Company, hadn't he, for the city of Chicago?

A. I don't know whether that report was made up at that time or not, but he had made up a report this year.

Q. That is, he completed it some time this year?

A. At least it was published.

Q. Now at this meeting he gave his views about the method and theory of fixing valuations on gas properties?

A. I don't think Mr. Haganagh did, as I recall it, if he came in at all he was in for only a very few minutes.

Q. Did he talk at all about valuations?

A. Not to my recollection.

Q. Mr. Klump gave his notion about it?

1588 A. I don't remember that we discussed what you call valuation. I don't know what you mean by that unless you mean the entire valuation. I don't believe we discussed that.

Q. I mean these theories, you talked about the theory at which you arrived at the so-called added costs, weren't those the things that were the subject of a conference?

A. There was probably some interchange of opinion on the principles of these matters.

Q. That is what the conference was for?

A. I presume it was arranged with the idea that any of us could derive benefit from the interchange of opinions.

Q. When you say there was nothing done there, nobody attempted to influence your judgment, all you mean is there was no one tried to force you to arrive at a particular conclusion?

A. I think the meetings were entirely free from any coercion of any kind, either direct or implied.

Q. Certainly, but they were both called and held for the purpose of exchanging views on this theory of added valuations to gas property, and those are the things you talked about?

A. Well, we discussed principles and interchanged ideas, but I must repeat as far as my figures were concerned, there was not the slightest influence brought to bear on me.

Q. Now at this conference, not only the engineers who were present, but counsel gave their ideas too about these theories of added values?

A. I presume counsel joined in the discussion.

Q. Now, Mr. Baehr, you say that you took the actual number of brick down here in these buildings?

A. As shown in the inventory.

Q. That is the fact?

1589 A. Yes, sir, as shown in the inventory.

Q. You don't mean by that answer you yourself had measured those buildings and ascertained the number of bricks; you simply took the measurements Mr. Brodnax made and his figures as to the actual number of brick?

A. As I believe I stated, I actually checked one or two buildings by very careful calculation to see that the quantities of brick were correct.

Q. You mean if their measurements were correct?

A. No, sir; I actually checked one or two buildings through for the quantities.

Q. How did you get at it?

A. I got the cubic contents of the wall and multiplied by the number of brick per foot.

Q. He used 22, didn't he?

A. I don't know what he used. I estimated mine on the basis of 20 brick and I got so close to his figure that I found it substantially correct.

Q. His figure I know was more than 20, but that was not ascertained by actual measurements in the building but is somebody's rule?

A. No, sir; I figured that out myself; bricks are various sizes- —

Q. That is the reason I don't know how you could do it by rule.

A. I got the sizes of brick from local manufacturers. If you were reproducing these buildings here you would have to use brick supplied by local manufacturers.

Q. So your figures have no reference to the invoice as to the identical brick down here?

A. Indeed they do have.

Q. I thought you took the size of the brick as they are made now?

A. You referred at that time to the rule for estimating the
1590 number of brick per cubic foot. I was going on to say for various sizes of bricks the number is determined per cubic foot, knowing the size of the brick and allowing proper space for joints.

Q. What would the size of the brick, if you were going to reproduce the plant, you would use the same size of brick down here wouldn't you?

A. That wouldn't make any difference in the value of the buildings.

Q. Would it make any difference in the number of brick. I don't care about the value of the buildings.

A. If you had bricks twice as large of course.

Q. Suppose they were an inch larger each way, what effect would that have?

A. That would reduce the number of brick.

Q. In adding thirty per cent to the present reproduction cost new of mains for the needs of the next seven years, did you add thirty per cent of the mains with paving?

A. Yes, sir.

Q. That is to say, in your figures this thirty per cent of extensions of mains you have also added thirty per cent to the cost of paving on the theory that those mains would all be laid after the paving was down rather than before?

A. I took thirty per cent of the total reproduction value of mains as I had figured it, estimating that would be the increase in investment in the mains.

Q. Did you do the same thing on services?

A. On services, yes.

Q. So those amounts and values are included in your figures of thirty per cent for increased cost over this period for extension of mains and services?
A. They are.

1591 Redirect examination by Mr. GUERNSEY:

Q. I wish you would state so as to make it clear whether your assumption was all new mains would be under paving or whether it was not?
A. My assumption was not specific in that matter; my assumption was the total investment would be so much. I based it on the percentage method, I based on no specific assumption as regards paving.

Recross-examination by Mr. BYERS:

Q. Do you know of any reason why this Exhibit 8 should have been refused us the other evening?

Mr. GUERNSEY: We object to this question and if counsel wants to know why it was refused, I refused it.

Q. Do you know of any reason why this Exhibit 8 should not have been delivered to us promptly the other evening?
A. I don't know anything about Exhibit 8.
Q. Is there anything in it you know of which in any manner affects your testimony or anything that you have included in your report in the way of valuations that you do not want us to know?
A. It is just as I stated, I glanced through it; I haven't the faintest idea what is in it except the meter tabulation I referred to.
Q. So that you do not understand why counsel insisted that we must get an order from the court?
A. I do not.

Mr. GUERNSEY:

Q. You also do not understand why counsel concluded that they would insist?
1592 A. I don't know anything about it at all.

Excused.

WILLIAM W. RANDOLPH, being first duly sworn on part of complainant, examined by N. T. Guernsey, Esq., testified as follows:

Q. Your name is William W. Randolph?
A. Yes, sir.
Q. What is your avocation?
A. Consulting engineer.
Q. Where are you located?
A. 165 Broadway, New York.
Q. Have you specialized as to any particular business that comes within your profession, if so, what?
A. I have specialized in connection with the gas industry.
Q. I wish you would state in a general way what experience you

have had in designing, contracting and operating gas plants and distribution systems and the apparatus used in them, and also in a general way what experience you had with reference to the valuations of such plants?

A. You want me to begin a brief historical——

Q. Give an outline of your engineering experience.

A. My experience in the gas business began about three years after I graduated from Stephens Institute of Technology. In 1889

1593 I went to work for the Gas Company at Kansas City. At that time I was employed in the design and construction of an electric light plant. From Kansas City I went into the employ of the United Gas Improvement Company. While working for them which covered a period of probably between three and four years, I was in the various departments from constructing various kinds of gas apparatus, both in their own plants and a number of outside properties, to being second in charge of engineering and the construction department of the Philadelphia office. In that position I designed a construction and operation in many cases of the various properties in which they were interested both as constructors and as operating them, came within the scope of my department, the department in which I worked. About 1894, I resigned my position with the United Gas Improvement Company and went with the firm of Humphreys & Glasgow Consulting and Constructing engineers, having offices in London and New York. My experience with them covered a period from 1894 up to January 1st, 1910. And during that period I was in charge of the engineering and examination of properties, operation of properties with which they were interested and actively connected, with both buying and selling and operating gas and electric companies.

Q. Through what territory?

A. My experience pretty well covered generally the larger towns I think in the east and middle west, and one or two in the far west.

Q. Was this firm of Humphreys & Glasgow engaged in the manufacture or selling any apparatus?

A. Their specialty was water gas apparatus; the apparatus that I have heard described in court here.

1594 Q. Now after you opened your own office about January 1, 1910, since you opened your own office, what business have you been engaged in?

A. I have followed the same line of work for myself that I followed for the firm and Company of Humphreys & Glasgow.

Q. Have you made a valuation of the property of the Des Moines Gas Company, complainant, in the city of Des Moines which it uses here in its business of manufacturing and distributing gas?

A. Yes.

Q. Now, I wish you would state somewhat in detail what you have done in the way of examining the property and examining the conditions in Des Moines and things of that character in order to aid you in making this valuation?

A. I first received what purported to be a schedule of the physical property of the company; that schedule I took with me to Des Moines and used it in checking up the apparatus that the company

has in its gas plant, visiting the property and examining the various pieces of apparatus; the various buildings enumerated in the schedule and identifying the same. I also familiarized myself fully as possible with local conditions relating to the company's business.

Q. What do you mean by familiarizing yourself with local conditions—please state whether you done anything with reference to familiarizing yourself with local prices or anything of that kind to effect the valuation?

A. In general by that I mean to cover familiarizing myself with local prices of materials and supplies in Des Moines and looking through the records of the company to familiarize myself with prices paid in Des Moines.

1595 Q. Have you prepared a memorandum which summarizes the results of your conclusions as to the valuation of this plant?

A. Yes, sir.

Q. Is this paper which is marked Complainant's Exhibit 22 the memoranda to which you just refer?

A. Yes.

Q. Now turning to page 22 of the report—before I ask you any question with reference to the buildings there referred to will you state in a general way what method you adopted in valuing this property and why?

A. In all of my values given here, all of my values given here are based upon the theory of reproducing the physical property as of the time of this examination December 31, 1910.

Q. Why did you adopt that theory?

A. Because that is a period in which the investigation is being made and I am advised by counsel that is the period and date that the valuation is desired as of, and you have to take some date in order to produce definite figures.

Q. I don't think you understood what I have in mind. What I wanted to get at was why in making this valuation you adopted what you call the reproduction theory?

A. I thought you were getting at the date. The reproduction theory is one of several that have been considered at different times: the cost of the property is one method if that can be obtained; that is very difficult to ascertain, and in this case I do not think the records would have permitted it, and if I had the time to go through their detailed——

The defendants object to this statement of the witness as incompetent and a statement of a conclusion so far as it pertains to the condition of the records of the company.

1596 Answer continued:—The reproduction theory represents to my mind the best method of ascertaining the fair value of a piece of property of this kind as of the present time. There are certain things that have market value and you can go into the open market and ascertain them. There are other things you have to measure by some comparison, because there is no ready market value for them. You might take as an example cast iron pipe, or wheat or any commodity in which the price per bushel or ton can be ascer-

tained as of a certain time and certain place; that would to my mind be the measure of its value at that time. Take something else for instance, you might take a portrait or painting the value of that painting could not be determined very well because a private party might place a sentimental value upon it.

Q. In a case of that kind one method that would appeal to me would be to go back to the original cost, or rather to go back to the cost—take an artist of equal talent with the artist that produced that product, and see what it would cost in the element of time or service to reproduce it. I don't know that I can answer your question very clearly. Those are the various elements it seems to me make the reproduction value one of the stringest upon which we can base our judgment as to the value of the property.

Q. Can you tell me Mr. Randolph about how long you have been using this reproduction method as a method for obtaining the value of properties of this character?

A. I don't think I can tell you exactly how long; ever since I can remember doing any work in this line I have been working upon reproduction, when no other measure was available. In many cases in the past there have been other measures in the purchase of gas companies available.

1597 Q. Can you tell me in a general way whether this method has been in use generally among gas engineers for say fifteen or twenty years?

A. Yes, I think the reproduction method has been for that length of period given very material weight by engineers.

Q. You referred to a list of physical property, a description of it furnished you by the company. Was that what we call Exhibits 15 and 16, the inventory?

A. No, I was furnished something very much like that, but was not exactly the Exhibit that is in the case. Since I have been here this last time I have borrowed a copy of the exhibits from Judge Carr and have compared the exhibit that was given me with that to see that it was substantially the same.

Q. That is what I wanted to get at, whether the list of property which was furnished to you was substantially the list of the property shown in the two exhibits 15 and 16 constituting the inventory?

A. Yes.

Q. Now, returning to these buildings, take the first building here, the purifying house, as an illustration and explain to the Master what you did in your effort to value it?

A. I examined the description and the drawings and made sufficient measurements on the building to satisfy myself that the details in the description were substantially correct. Having ascertained that fact I calculated the quantities of material in the buildings, using the drawings as a basis of my calculation, not in as great a detail as the company had developed theirs, but by *usi* using some shorter cuts and different methods I arrived at the ultimate price. I converted the excavation into cubic feet and put a price per foot on it. The brick work into cubic feet and put a price per foot on

1598 that. The brick work I think in most cases I figured solid and added for windows and doors, if there was anything to

be added for that item. The item of roof from a consideration of the drawing and inspection of the building on the ground, I would place a unit price on the roof as a whole per square foot, going through the building in that detail would produce a certain set of figures which approximated in my judgment the cost of reproducing that particular building. The same process was used in regard to each one of the buildings. I grouped as much as I could those things together as a whole, using as few items to put prices on as I conveniently could.

Q. Now you have referred to unit prices in your answer. I wish you would state now generally whether in each instance the unit prices which you took or the prices of labor or material which you adopted or of apparatus or anything else that went into this plant, was in your judgment the fair, reasonable price for the article in question to be used for the purposes of a valuation of this plant as of January 1, 1911.

Objected to on part of the defendants as incompetent, immaterial and the witness is not shown to be competent to answer it.

A. It was.

Q. Now, Mr. Randolph, did you have any experience in connection with the buildings, the character of the buildings that are involved in this plant?

A. I have.

Q. For how long a time?

A. Covering a period of 18 or 20 years probably.

Q. What is the fact as to whether that experience has gone to designing construction and supervising construction?

A. It has.

1599 Q. How general has that been in the localities of the United States?

A. It has covered a very considerable territory, covered those points in the state of Massachusetts, North Carolina, Alabama, Pennsylvania——

Q. Did you get any further west than Pennsylvania?

A. Kansas City. I could enumerate a good many places.

Q. I do not care to have you enumerate them all. Did you make any special investigation as to these matters locally in Des Moines?

A. Yes, I found that the company's representatives had accumulated considerable data on the subject, and from local contractors and other sources as to the costs of material, the cost of labor, etc., that I saw, and I also conferred with two of the contractors that furnished that data, checking up first hand their ideas as to the correctness of the figures that I saw tabulated.

Q. And are those statements true generally as to all the items that go into your estimate. I don't want to ask you about each one unless counsel insist on it. That is, as to your knowledge and experience and checking up as to local conditions if there were any local conditions.

A. I have endeavored in each case to make my experience conform to local conditions.

Q. And you have experience as to each of those matters that is involved?

A. Yes.

Q. Now, I will ask you again whether the unit prices adopted by you and the prices for labor and material, for apparatus and the prices for all the various items that go to make up this property which you valued, as they have been used by you were fair,

1600 just and reasonable for the valuation as of January 1, 1911.

Objected to on part of the defendants as incompetent, immaterial and the witness not having been shown to be competent to cover these general features, and it already having developed by the examination of this witness that as to a large number of items his knowledge is based entirely upon hearsay.

A. In my opinion they are.

At this time an adjournment was taken until 1:30 P. M.

1601 1:30 P. M. THURSDAY, *August* 31, 1911.

WILLIAM W. RANDOLPH, being continued on direct examination by N. T. Guernsey, Esq., testified as follows:

Q. Mr. Randolph will you please state what in your judgment is the estimated cost new of the building we have been referring to, the purifier house?

Objected to as incompetent, the witness is not competent.

A. $10,500.

Q. Under this building I see in parenthesis a statement, pages 16 to 24 inclusive. What do these pages refer to?

A. On the first page of this statement you will find a note which says the following page and sketch references are to pages Exhibit 15 and sketches of Exhibit 16 found in complainant's Exhibits 15 and 16.

Q. So that refers to these exhibits with reference to these buildings here?

A. Yes, sir.

Q. That amount $10,500 which you call estimated cost new is what we have been calling the cost of reproduction?

Objected to as a statement of counsel and not an in inquiry, incompetent and immaterial.

A. Yes, sir.

Q. Now proceeding will you please state whether or not this Exhibit 22 shows as to each of the buildings the estimated cost new or reproduction cost?

A. It does.

Q. And please state whether these amounts as you have

1602 given them here are in your judgment fair and reasonable?

Objected to as incompetent, irrelevant and immaterial, the witness has not been shown competent to make such general answers to general questions.

A. In my judgment the prices stated here are fair and reasonable.

Q. The total of the estimated cost new of the buildings is in your opinion what?

Same objection.

A. $93,960.

Q. I notice just preceding that two items yard paving and fence. Please state whether or not they are included in this total.

A. They are, both items of yard paving and fence are included.

Q. Now you have another column in these pages two to 5 inclusive of Exhibit 22, which is estimated physical decay. Will you please state what you have covered in that column?

A. By estimated physical decay I meant to define as specifically as I could the depreciation I take into consideration there. That is the amount that if you could do it, would be required to put that building into as good condition as new.

Q. Now how do you arrive at these amounts?

A. By inspection of the buildings and placing an estimated depreciation on the elements in the building that were depreciable.

Q. Now I notice in boiler house station and generator house on page 3 and in carpenter shop barrel oil house pump house, oil pump house and meter house on page 4, there is nothing in this column opposite the items that have been referred to. What does that indicate?

A. I didn't notice anything on those buildings that I thought was depreciated or decayed.

1603 Q. What does the amount, $8,282 in the last line of page 5, where the figures appear represent?

A. It represents my judgment of the amount of physical decay as previously explained that exists today or at the time of my inspection which was practically the same as of December 31, 1910, exists in the buildings described in those pages.

Q. As we have these totals page 5, $93,960 estimated cost new and $8,282 estimated physical decay, will you please state whether they are carried into any summary and if so where we shall find this summary?

A. On page 1 of the statement you will find buildings page 5, of this appraisal estimated cost new $93,960 estimated physical decay $8,282.

Q. Now what general items do you next take up?

A. The items of machinery and apparatus in the plant.

Q. And do they appear under the head of machinery beginning with page 6?

A. Yes, sir.

Q. Now please state whether you have estimated the cost new of each piece of apparatus or machinery which you have specified in your report on pages 6 to 12 inclusive except where you have grouped several items and whether you have in these cases estimated cost new of the items so grouped?

A. They are to be taken together and the estimate is as of reproduction new. There are two or three items in here which I did not produce the original detail figures, but took figures which after look-

ing over them commended themselves to my judgment. One of these was the item of furniture and fixtures in the west side office, meter and fitting shop shown on pages 239 to 243 of the com-
1604 pany's schedule. That I took largely from the company's inventory, that is from the company's I don't mean inventory, but from the company's costs. I think the same is true of tools and the same is true of stable equipment. That was taken from an estimate made by the company which in looking over it, it looked to me reasonable.

Q. Aside from the items which you have mentioned I wish you would state whether the estimated cost new, as it appears under the heading machinery in Exhibit 22, is as to the various items there set out your judgment of what would be a fair and reasonable cost for the item in question if the plant were to be reproduced as of January 1, 1911.

Objected to as incompetent, irrelevant, the witness not having been shown to be competent.

A. It is.

Q. And what does the column estimated physical decay as to these matters of machinery and apparatus cover?

A. That represents the state or that represents the amount of money which in my judgment would be required to be expended on those pieces of machinery if it were possible to put them into as good condition as new.

Q. And what is the total amount of the estimated new cost of machinery?

A. The total amount as found on page 12 and as total machinery $534,058. This is transferred to the summary of totals on page 1 the same amount.

Q. And what is your total estimated physical decay?

A. $84,710 which is also transferred to page 1 in the summary.

Q. You say that also appears on page 1 of Exhibit 22?

A. Page 1, yes.

1605 Q. What is the next matter which you took up?

A. The distribution system, first taking up the mains, street mains.

Q. I notice that you have the mains here subdivided under the various sizes two and one half inch and under up to 24 inches with the number of feet of each size of main. State in a general way how you arrived at your estimate of the cost of the reproducing of the distribution system, that is the mains that form part of the distribution system first.

A. The company gave me the schedule showing the lineal feet of mains that they own. That I accepted as correct. That schedule showed the lineal feet of mains in use November 1st. To the extent that they have added to the mains between November 1st and December 31st, I find I have made an omission. In other words my figures here do not include additions to the plant from November 1st to December 31st. I examined the conditions that existed in Des Moines as to soil, general conditions of the streets, etc., that you

had to contend with. I had an opportunity to study the company's description of the conditions that existed here, I took occasion to discuss with the people who were most in contact with the distribution system, the conditions that existed, the condition in which *th* the main was found upon examination. I saw very little of the distribution system proper myself, because since I have been here comparatively few streets have been open. Those streets that were open that I knew of, I made it my business to make an inspection or to verify as far as possible my origial judgment.

Q. Now then you say where a street was opened you made
1606 it your business to make an inspection. What sort of an inspection did you make, what did you do?

A. I examined the nature of the soil, nature of the street covering, got down in the trench and examined the pipe to see whether it was as stated to me, the nature and condition.

Q. Now what did you find as to the condition of the mains as far as you examined them?

A. As far as I examined them myself I found them to be good.

Q. What in your opinion is the estimated cost new of the mains that is what in your judgment *is what* would be the reasonable fair cost of reproducing the mains which are a part of this system?

Objected to as incompetent and the witness is not shown to be competent.

A. $1,227,612.

Q. What did you do with reference to services, that is did you ascertain what their value was in your judgment?

A. Yes, I pussued the same general method as to services. I had access to all of the company's records that I wanted to go into and I used both on the mains and on the services that data to check up my judgment with.

Q. And as to house services as they existed on the first of November, 1910?

A. I assumed that the number of services given me were correct and my judgment of the fair value new, fair cost of reproducing new was $—.

Mr. BYERS: Wait a minute please. If that answer is to go in I want an objection to it. I don't understand counsel has asked that question *yes*, however.

Q. What in your judgment is the reasonable actual cost of
1607 reproducing the house services that you have referred to?

Objected to as incompetent, no proper foundation having been laid for the inquiry and the witness is not shown to be competent.

A. Total services $393,647.

Q. These services are what? What do you mean by a house service?

A. They are the physical connection between the gas main and the gas meter.

Q. Above or below ground?

A. Below ground, wrought iron pipes in most cases in fittings

running from the main in the streets to the inside wall of the house.

Q. To what extent is it physically possible to make an inspection of the services without digging up the pipe?

A. It is impossible to inspect the underground work without digging up the pipe.

Q. What proportion of it is under ground?

A. All of it except possibly something that might be in areaways exposed pipes, small sections, but it is under the street or under the paving or under the lawn.

Q. Turning a moment to mains, you said you had been given some information about them and that you had attempted by taking all of the opportunities of which you knew while you were here to verify this by examining the mains themselves where they were exposed for any purpose. So far as your examination of the mains went, pleases state whether or not it tended to confirm the information that had been given to you with reference to them or their condition.

Objected to as incompetent and immaterial.

A. Yes, sir. In every case before I went to examine an
1608 opening of a main I made inquiry of people that I thought were best posted on that particular subject and then when I got there I examined the conditions as stated by them and got a check in a way on their judgment on other matters to see whether we agreed on that particular subject.

Q. Who was the person whom you have referred to as best posted you talked to about this?

A. One of the persons was Mr. Vincent, another was Mr. Henry Moul.

Q. Now your next item here is what?

A. Lamp services and posts.

Q. And what in your opinion is the reasonable cost of reproducing this item as of the date we have mentioned.

Objected to as incompetent, the witness not having shown his competency and no proper foundation laid for the inquiry.

A. $23,256 which is carried forward to page 1,—no that is not carried forward, it is the total.

Q. Your next item is meters in use. Explain what you did with reference to meters.

A. I made no attempt to ascertain whether these meters were or were not in use, accepted the company's inventory having questioned them as fully as I could as to the method of arriving at that inventory and having placed a value after having gotten the information in that way.

Q. And what in your judgment is the actual reasonable cost of reproducing these meters as of the time referred to.

Objected to as incompetent, the witness not having shown his competency.

A $240,057.

1609 Q. What is the next item?

A. Meters in stock.

Q. What in your judgment is the actual reasonable value of these meters as of the date referred to?

Same objection.

A. $7,924.

Q. Now you have against this distribution system under your column estimated physical decay the amount $189,249. I wish you would state what that is and how you arrived at it?

A. That is 10 per cent of the estimated cost new and represents my judgment of the amount that would be required if it were possible to put these mains, meters and services in to condition as good as new, that would *respote* them.

Q. Can you explain to the Master how you arrived at this amount?

A. Well only partially. It is largely the result of experience taken in connection with what I can learn locally of the condition of the several parts taking them up in detail. The mains for example I have been unable as I stated to examine those mains except in a very few instances to determine what the present state of the case is but that pipe that I have examined has not shown any appreciable decay and I have examined pipe as near as I could get from the best posted men here up to 45 or so years old. That indicated no physical decay on pipe itself. Then you take into consideration the condition of the mains as shown by the unaccounted for gas or leakage as it is commonly called, the condition that exists as regards electrolysis which I inquired into very carefully and so far as I could learn there is no appreciable amount of electrolysis that has taken place in the gas mains. An *ex*-examination of the soil would

1610 tend to confirm in my mind the fact that the electrolysis would not take place very rapidly here, conditions appear to be more or less favorable, the pipe that I examined myself don't show any signs of it. I made no critical examination to determine how much current the mains may or may not have been carrying. Taking these elements into consideration and also my past experience with mains I have formed an opinion that there was not much depreciation that really existed there. Now as to house services in some cases I have seen services here that were twenty-five years old that were good. The actual condition of these services in real *use* I don't know but that in a way again is reflected in the leakage account. If the services were in very bad condition, deranged badly, you would naturally expect to find the leakage high. The same line of inquiry made as regards mains was made as regards services and an effort was made by me to reach as near as I could the actual physical decay by these people in daily contact with the mains and services. As regards meters I was shown a sheet that gave the so-called age of the meters. So many meters, I have forgotten the years, between 1886 it began with and ran on down by years. That I had before me in a way to represent the length of time that they had been operating a certain number of meters and I also had access to the records of the company which showed the number of meters *if* different sizes that have been renewed and condemned and re-

paired and the number that have been removed. I knew from observation of the number of meters in the store room, repair shop here, what the general methods of taking care of meters were, satisfied myself that they were well taken care of and from data
1611 of that kind I arrived at the conclusion as to depreciation of meters, while apparent age would be gotten by multiplying the number of years that a certain number of meters were said to be in use by the number of years that had elapsed between that period and the present and averaging that might show a pretty long period of use or it might not still the meters themselves are frequently gone over. It would be difficult to say from my examination so far just how often every meter is examined, but I noticed in the past five years from 40 to 45 thousand meters have been taken out and taken to the repair shop. Of that probably four or five thousand have been actually repaired and condemned, when a meter is condemned a new takes its place so that is renewed in toto in effect. Then 40 to 45 thousand total meters that have come back to the shop, they are gone over and tested each time before they are sent out and if they are not in good condition as represented by tests then they are sent off to be repaired. From consideration of all that class of information I have formed my judgment on meters and while it might be if you attempted to differentiate there, there might be more than ten per cent on one item and less than 10 per cent on the other still on the whole it seemed to me that ten per cent was a reasonable figure for depreciation that exists up to the present time irrespective of the age. That seemed to me to be as good as any other judgment I could arrive at for depreciation.

Q. Now are the tota-s of this page 13 carried by you into this summary on page 1?

A. Yes, sir.

Q. The next item in this summary is land value $240,000.

1612 *Q.* How did you get your value of the real estate?

A. I assumed a value taken from the company's figures that were given to me and since I have been here I have noted in the testimony the valuation put on the land by some of the experts that have already appeared and that tended to confirm the value that I previously assumed so that the original assumption I left stand.

Q. You don't claim to be an expert on real estate values in Des Moines I assume?

A. No.

Q. What in your judgment is a fair and reasonable amount of the item that we have been referring to as working capital?

A. $160,000.

Q. Tell us how you arrived at that if you please?

A. From a consideration of the different elements that go in to make up the amount of money tied up in the company's business, the stocks of material, outstanding gas, cash required to operate the business.

Q. What do you mean by outstanding gas?

A. Uncollected gas, gas made and the expense of making the thing past as far as manufacture goes but money not yet received or collected.

Q. Now what in your judgment is the amount which should be allowed on account of the item that we have been designating as going value?

Objected to as incompetent, immaterial, the question is based upon an assumption that is not in the testimony of this witness.

A. That element in going value which is represented by the cost to develop the sales of gas from zero to the present, to the
1613 present—to the amount that they were selling as of December 31, 1910, which exceeded $510,000 in my judgment was five hundred thousand dollars.

Q. You said the amount they were selling, I guess you stated what you intended to, did you intend to state in dollars or feet?

A. I meant to state in feet.

Q. How many feet?

A. 510 million feet.

Q. Now will you please explain to the Master fully and in your own way how you got at that?

A. It is a problem that I hardly feel able to explain in detail the processes, but it is the result of my experience and the conclusion I reached based on all of the elements that I take into consideration that enter into the problem of what it would cost after you have gotten a developed plant to develop sales from nothing to the present volume of sales. That may not be at all convincing to the Master's mind or to any one else's, but it is difficult for me to analyze my mental processes or to bring up and say in detail how I arrived at an opinion or conclusion of that kind. The various measures that have in the past been put on that each and all have some merit and are worthy of some consideration. The method of placing a certain amount per consumer gotten as representing the expense applied to the individual consumer, you would find some examples of that in the company's present method of doing business. They have a new business department which cost them a definite amount to operate. They will in a given period make certain expenditures for the development of new business and the result of that *are* shown in
1614 the increased number of consumers that they take on. Roughly speaking as I recollect the figures the year 1910 sho-ed an increase in consumers and by consumers we will say that a meter represents a consumer, an increase of meters of about 1300. The cost of the new business account showed about $24,000. Now all of that new business is not entirely due to the expenditures of the company in its efforts there. Some of it accrues to it by reason of the natural growth of the town. You might say that—it would be purely an assumption, but I recall looking up the population in 1900 and 1910 and I thought that the probable rate of growth was at least 2000 per annum. If you make an assumption of that kind estimating five people to the family you would get about 400 consumers that would come to you from the natural growth of your city. That would leave a balance of 900 that would accrue to you from the business department. Assume roughly that there was a thousand that the new business department obtained, that would give you approximately $24.00 as the expenditure of the com-

pany during the past year for such new business and new customers as they acquired. Now that is just one example. I don't know that there is any particular conclusion to be drawn from that, but it is just given as an example. You will find in other cities that the same thing can be adduced which will result in different figures, sometimes more or sometimes less per consumer. And from that kind of experience some engineers have taken as a basis so much per meter connected which as I said before has some merit and is worthy of some consideration. The cost of developing your business will depend largely upon the assumptions that would make in your estimate, length of time that you take to get your business and
1615 fair rate of return is involved in that because it is not only the direct cost that you spend in getting business such as is reflected in the accounts as kept by the company now, but it is the loss of interest, loss of the fair return upon your dollar invested from the time that the plant is completed and ready to begin delivering gas up to the time that the period is reached when you are selling the full output of the plant taking at the time at which this valuation is made. I don't know that I could explain—I could talk a long time on the subject, but I don't know that I could tell the court any more clearly exactly how I arrived at it than by mentioning those various elements.

COURT: Practically the same method as these other gentlemen?

A. No, I have not gone through any such process of computation at all. As I see it, it is an opinion estimate, opinion as a result of all considerations. That is the only method I know. I know that is used by competent engineers, it is used in water cases, it is used in gas cases, has been used recently in gas cases. That I have not compiled myself but I had the benefit of knowing what those figures resulted in, what those computations resulted in.

COURT: You had the benefit of that?

A. I had the benefit of that. I heard that testimony in court.

Q. When did you first learn what the going value computations of Mr. Lea and Mr. Baehr had resulted in?

A. When I heard them in court.

Q. When you heard them testify?

A. I did not in every case hear them, but when I speak of hearing I either heard them in here or was told about them after they were on the stand, because I was not in court every day.

Q. You as I understand it did not follow that method at all?
1616 A. No.

Q. What in your judgment Mr. Randolph was the total estimated cost now or the actual reasonable cost of reproducing the property of the complainant, the Des Moines Gas Co., used and useful by it in its business of manufacturing and distributing gas in the city of Des Moines as of January 1, 1911?

Objected to as incompetent, and the witness not having been shown to be competent, no proper foundation laid for the testimony.

A. $3,420,514.

Q. And what at the same time was in your judgment the amount which should be deducted from the amount you have just stated

on account of physical decay or depreciation in order to get the actual reasonable value of the property referred to at that time.

Same objection.

A. That question calls for an answer which does not seem to me quite right, what I mean by those figures.

Q. Tell us then in your own way what you mean by those figures. What I want to get at is as near as I can the actual reasonable value of the property January 1, 1911, in your opinion?

Objected to for the same reasons as the former question.

A. What I mean by estimated physical decay there or perhaps to my mind what is in the valuation appraisal there is to represent the amount that the property has depreciated in value due to physical decay and to represent a sum of money which will have to be put back into the property from some source in some way to make it fully up to the cost new. Now that does not represent that the plant in my mind is depreciative so far as operating efficiency is concerned. It is good as far as the public—it has got as far
1617 as the public is concerned 100 per cent efficiency. The fair rate of return, the amount upon which you should get a fair rate of return in my opinion is the first column or as new and not the depreciative cost. For that reason I say that I could not answer your question directly because you charge off of the cost new the depreciation. If you want to get at my opinion how it should be used I had to go into that explanation.

COURT: Should be the cost new less $500,000?

A. I think the $500,000 stands in the same class with the other elements in there. The $500,000 is part of the expenditures in one form or another that the company has made to complete its plant and complete its business, to build this plant and acquire this business and that from the cost new so long as the company has to maintain and does maintain its plant that you should not depreciate for the purpose of determining the fair return. The fair return should be once you invest a dollar you should get your fair return on that from the time the dollar is invested until it is returned to you in some form if at the end of your existence you should have acquired a sinking fund there to return your original investment. If you are going to keep on indefinitely then that sinking fund does not necessarily have to be prepared. If you started and invested your dollar in the first instance if you later come along and put a depreciation of 50 per cent upon that because of its present condition, then you have depreciated that original dollar invested 50 per cent and won't get a fair return only on one half of what you originally put in and I still have to maintain my plant and am going to maintain it. Therefore, I think the value new is
1618 the basis for the return in the case of this particular company. I have made some inquiry as to what the depreciation they have written off or they have charged up before this amounted to. I have not taken this directly from the books, I have been advised that the surplus the company now has and the depre-

ciation that it has written off within the past two or three years exceeds materiall- the amount of physical decay that I think exists there today.

COURT: You would not allow anything or you would not charge off anything annually for physical decay upon that principle.

A. Upon this principle I would not charge off, I would keep my investment intact. I do not judge the depreciation over future years by the exact amount of physical decay that is represented there today and that I find exists because I don't know how many years, I can't tell without more detailed examination than I have made how many years that decay has been accumulating. The company has been in existence here for a great many years, but it may have renewed and maintained, it has maintained in various ways its plant and that represents to my mind the amount of decay that exists. Now when you come to deal with the future, that is another problem. I don't feel I am bound by that figure in dealing with the future. I feel that there I have got to exercise my best judgment in the physical decay that is represented at the present time. I can't go through and look at it, but I can estimate in the mains but like a building I can go through and see how much decay has taken place and it is immaterial to me whether that building is one year old or a hundred years old so far as I am concerned if it is there of useful design and adopted to the purposes of its use at the time I make the examination. The age has no bearing whatever on it. Now when you are dealing with the
1619 future you have got another situation there. You take into consideration another set of problems. But when you come to say what is the physical condition of the property now, my contention is that all you have got to do is to get that account by looking at it irrespective of age. If a man tells you a building is fo-ty years old, the building is there and I can look at it. The same is true of everything else. You can tell me mains are a hundred years old, but I have got to get some ther evidence additional to that before I can determine what the present condition of those mains are.

Q. Did you make an estimate Mr. Randolph, I don't know whether you did or not as to the amount which should be charged off annually or charged to the operating expenses annually in the future on account of depreciation of this property either in dollars or in cents per thousand.

A. I have not yet Mr. Guernsey. I have got the elements to use in forming that judgment, but if you desire to go into that detail with me I will have to take a little time to consider this and bring them togethe- before I would want to give you an opinion on that subject.

Q. Then we will pass that for the present. Now Mr. Randolph what can you say in a general way as to whether this plant is adapted to the requirements and the services which are demanded of it here in the city of Des Moines?

A. I have examined the plant and my opinion is that it *as* adapted to the purposes of its use.

Q. What is your judgment as to its adequacy, as to whether overbuil- aand things like that?

A. Well in some respects it is a little underbuilt I guess.
1620 The holder capacity is getting pretty close to the limit where they will need more capacity there. They have far exceed- the day's output—that is in the day's output they have far exceeded the holder capacity. The other elements that c-me into *into* the main part of the manufacturing plant are not overbuilt I don't think. Take the generating capacity you have there five units. One of those units alone at the present time can maintain the output of the plant if everything is all right. You are very close to the period in your future history probably where one machine alone will not. Now take another combination you have got two other units smaller, the two 8 foot six sets which combined will do as much as the one ten foot six set I have just referred to. Then as a spare you have the old six foot sets which by themselves you would be unable to produce enough gas to supply the demand here in the maximum condition but they are useful up to the point that you can throw them into use in the case of an emergency. So taking all these things into consideration the generating plant is not overbuilt.

COURT: I see you have got on page 11 2 8 foot 6 sets at $29,760 and one *t0* foot 6 foot set at $21,380. What is the difference in the co-t?

A. Water gas apparatus is not bought on its capacity alone. Two 8 foot six sets, you will note that these water gas sets include an additional item there of *s*cubber, that is one more item than the third set has got, that ends at the washer. Then they are an entirely different size and they result in a figure which is not necessarily and directly proportional to the output of the machine. The capacity of these machines var*y* from the rating, given one capacity with one kind of fuel and another capacity with another kind of fuel.

1621 COURT: I just wondered why the larger one cost less than the smaller one that is all?

A. The larger you go under certain lines and capacity the more efficient the machine is from the view of investment. It will turn out a larger amount of product for a given investment, per unit of invest*j*ent you get a larger return in output. It costs less per unit of output that is one reason why the small units are not built to go into a very large plant.

Q. Did you make any estimate as to what expenditures will be required in the plant here in the near future in the way of additions?

A. I did some estimates on that but I have not got them in completed form for use now because I didn't know that that was going to come up.

Mr. GUERNSEY: We offer complainant's Exhibit No. 22 in evidence.

Objected to as inco*n*petent, irrelevant, no sufficient or proper foundatio*j* laid for its introduction.

Cross-examination by Hon. H. W. BYERS:

Q. How much of your experience during the years since 1889 has been as operator of gas plants?

A. It would be very difficult for me to say in percentage of time. From 1896 on I think I have been pretty intimately connected with the operation of plants.

Q. And at different localities in the country difference points throughout the *company,* or has your experience been largely in one place during that time?

A. No, my experience has been in different localities.

Q. From Kansas City on the west and south on east to the
1622 Atlantic coast?

A. Well no I never had any definite experience in the operation in Kansas City since the period I spoke of. I am referring to the period after I left Kansas City.

Q. You left Kansas City in the 90's?

A. I probably left Kansas City in the 90's.

Q. And during the years say since you left Kansas City and up until the time you opened your present office in New York City did you own any gas properties?

A. I have owned stock in gas companies.

Q. I will come to that later. Have you owned and operated any gas plants on your own account during these years?

A. I have operated in an advisory capacity plants that I have been interested in, but as I say stockholder.

Q. How recently have you been *superiving* the operation of a gas plant in which you had a financial interest?

A. Why I suppose for eleven years.

Q. And you still are occupying that relation to the same plant?

A. I am consulting engineer for the same plant.

Q. You have a financial interest in the plant?

A. Yes, I am interested in some of their preferred stock.

Q. Now how many gas plants do you have stock in at this time?

A. I don't think I have got stock in any of it.

Q. Is it hard for you to settle that in your own mind?

A. Yes, because I have got several cats and dogs of stock that I am not sure whether I have let them go or not, it has been so long ago that I saw them.

Q. I am speaking of gas properties, not any other property?

A. That is the kind of stock I am talking about too.

Q. Do you think of more than one concern that is in oper-
1623 ation now and in which you have financial interest whether by stock or what it is?

A. Yes, there is probably two that I am interested in.

Q. If I remember your examination, I didn't take very careful note of it, you opened your present office in New York City within the recent year?

A. Within a year and a half, January 1, 1910.

Q. Prior to that time you were an employé of the Humphries and what is the other name?

A. Humphries & Glasgow up to the October a year before I left

them I was in the employ of a firm called Humphries & Glasgow, but for the following year I was vice president and also in the employ of the same company but continued as an incorporated company, concern.

Q. Now Mr. Humphries of that concern, what relation does he bear to any gas properties that you know of?

A. Well I really don't know what his relationship or companies are now.

Q. When you were with the United Gas & Improvement Company did he have any relation to that company?

A. He was the general superintendent — company *of* that time.

Q. And what relation did his firm bear to that company?

A. They were in the position of competitors.

Q. Weren't they consulting engineers, wasn't the firm acting frequently as consulting engineers for the United Gas Improvement Company?

A. No.

Q. At no time while you were with them?

A. No, I think as near as I can recall there were probably two or three minor pieces of work that the United Gas Improvement
1624 consulted us for.

Q. Mr. Humphries is president at this time of the Buffalo Gas Company isn't he?

A. Yes, sir. I answer yes, I don't know whether he is or not.

Q. Do you have any present employment with the United Gas Improvement Company?

A. No, sir.

Q. You say you have no employment now?

A. No.

Q. Where was the last employment you had with them?

A. I think it was in 1894.

Q. Now since you opened your office in New York City in what way have you occupied your time?

A. In consulting work.

Q. How much of the time since you opened your office in New York have you occupied in fixing values upon gas properties, furnishing information for the purpose of arriving at values if any, or advising with respect to the value.

A. I have devoted considerable time to that work but I don't remember just what percentage.

Q. How many cases do you have on at this moment?

A. You are getting into personal work that I don't know whether I have to answer or not. I don't want to go into my private business.

Q. No, I will not press you for the particular places at all, but just the number and it is proper for me to do that to test your relationship to this case and as it might affect the weight of your testimony here.

COURT: He says he don't want to know the names of the company.

Q. (Question read.)

1625 A. Two.

Q. Not counting the Des Moines case?

A. Yes, counting the Des Moines Company.

Q. One other besides the Des Moines?

A. One other besides the Des Moines.

Q. Now how many in a general way, without going into details, similar cases have you handled since you opened your office in New York?

A. Do you mean by that similar to this?

Q. Cases where your employment was similar to what it is here?

A. Employment before a court?

Q. Well not necessarily before a court, but in making up and estimating values either before courts or commissions or for investors or for gas companies.

A. For any purpose you mean?

Q. For any purpose, yes. How many in a general way without going into details, similar cases have you handled since you opened your office in New York?

A. I should say half a dozen or so.

Q. Were any of these matters within very recent months?

A. Yes, sir.

Q. Have you occupied any of your time during the period since you opened your office in New York in doing this class of work for municipalities or cities?

A. No.

Q. You specialize along gas lines as a gas engineer?

A. Yes, sir.

Q. In fact you are making that your life work now as I understand you?

1626 A. Well I have made that my life work for a good many years you might say.

Q. Gas engineer as distinguished from other kinds of engineering?

A. You might put it this way that my engineering experience has been divided for twenty years along the lines of gas and electric light and street railway property.

Q. Now has that been in fising values upon their property largely?

A. That has been in a comparatively small way in—it has been to a considerable extent in fixing values upon property.

Q. Well is fixing values upon gas property your specialty now?

A. No.

Q. Have you had any other kind of employment for gas companies recently than fixing values?

A. Yes, sir.

Q. Along what lines?

A. Along the lines of advising as to operation, design of plant operation of plant.

Q. These several instances that you answered a few moments ago were confined to valuation cases were they?

A. It was a general proposition. No, you made it general.

Q. Yes, I made it general and your answer was general?

A. I answered it generally.

Q. Were you ever in Des Moines before last January?
A. Yes, I was in Des Moines in the early 90's, I can't recall exactly the year now.
Q. Did you stay any time?
A. I think I was here for several months.
Q. And what were you engaged — here at that time?
A. At that time I was assisting Mr. Pratt the manager of
1627 the plant in a fuel gas trial he was making.
Q. You were here when the company had a law suit and trial in 1895 were you not?
A. No.
Q. And in 1892?
A. No. I have not been here in connection — any other work than what I have just stated to you until I came this last year.
Q. When you were here in 1894 what was your work?
A. Well I didn't say I was here in 1894. My recollection is not perfectly clear, I would have to refer to some further data to know exactly when I was here. The only time I was here before was in connection with this fuel gas experiment that Mr. Pratt was conducting and that was either in 1890 or '92, I don't recall which.
Q. It is not so important about the time as it is what you were doing. You were assisting Mr. Pratt in that experiment.
A. Yes, sir.
Q. And you were here as an employé of the United Gas Improvement Company?
A. I think I was at that time. I was assigned to Mr. Pratt, but whether I was on Mr. Pratt's pay roll or not, I don't know. That was immaterial and I was in effect in the employ of the United Gas Improvement Company.
Q. Now were you ever here after that time again until last January?
A. I think not.
Q. And how long were you here last January?
A. I don't think I was here in January. I will have to refer to my memorandum, I assume you wish to know when I was here.
Q. Yes, I do.
A. I came here on February, Monday the 13th, Monday
1628 morning the 13th and I left Wednesday night the 15th of February.
Q. 1911?
A. 1911.
Q. How did you come to come here at that time?
A. I came here to make the appraisal I have just completed, start the appraisal I have just completed.
Q. I know, but in response to somebody's request?
A. Yes, sir.
Q. Who requested you and when?
A. The date I do not recall and I think it was the secretary of the Des Moines Gas Company.
Q. Was it by letter or how?
A. I am not sure now. I had several communications on the subject I think the first one was by telephone.

Q. Don't you have a memorandum of that date?
A. No.
Q. I mean when you received your first or had your first communication with respect to valuing this property?
A. I may be able to get back to it, but I have no data here that would enable me to do so.
Q. It was however, before the 13th of February?
A. It was early in February. It was some time between the 13th as I recollect it and the first of February.
Q. That you first received a communication?
A. That I received any communication in regard to the appraisal of the Des Moines company.
Q. And you came on and was here then three days in February?
A. I was here two days in February, the 13th and 14th of February.
Q. Then when did you return again? I will sho-ten it up by asking you how long you were here altogether prior to the open-
1629 ing of this trial?
A. I was again in Des Moines coming on Sunday the morning of the 12th, no Thursday morning March the 9th and I left Monday night the 13th.
Q. From the 9th to the 13th?
A. From the 9th to the 13th and I was away from here one day at that time, Saturday I was out of Des Moines.
Q. Well we will call it all here from the 9th to the 13th, four days. Now when again if at all before the trial of this case?
A. At no time.
Q. So that altogether since your first communication from the gas company asking you to come here you have not been in Des Moines to exceed 12 days?
A. Whatever that time results in. It was two days the first time.
Q. It is not near that much, but I made it large enough so you would not have any question about it. Ten or twelve days at the outside?
A. Yes, sir.
Q. Now while you were here the first time who did you see?
A. I saw Mr. Haines, Mr. Vincent.
Q. Mr. Haines is the president of the company?
A. Yes, sir.
Q. And who is Mr. Vincent?
A. Mr. Vincent is the engineer of the Des Moines Gas Company. And I saw employés under them. I saw some of the contractors in town.
Q. Who of the contractors do you remember you saw?
A. Mr. Brereton is one name.
Q. He is the man that built some of these buildings down here?
A. I think so. I am not sure about the other name, seems to me it was Mardis.
1630 Q. Yes, there is a contractor Mardis here. Now any others?
A. No, no other contractors at that time.
Q. Well any other persons whether contractors or not?

A. Oh I saw a good many persons here.

Q. I mean connected with this business of course?

A. I saw the employés of the company.

Q. You stated that I think. I mean now any other person that had any relation to this company or to your figures?

A. Upon either of these trips?

Q. Yes; put it on either.

A. At either time, there were upon one of these trips I don't recall now which, I think it was the last one, several of the men that I see in Des Moines today that were not there the first trip that were connected with the inventory in some shape or form.

Q. Mr. Lea, did you see him?

A. No, I didn't see Mr. Lea. I didn't see Mr. Lea or Mr. Baehr here. I saw Mr. Brodnax I think and——

Q. Klumpp?

A. Mr. Klumpp.

Q. Douthert?

A. Mr. Douthert was here yes. And there were a number of men here at the time, I don't know as I can call all their names.

Q. Well in connection with this matter, they were here in connection with this matter?

A. They were here in connection with the case in some capacity or other.

Q. Now Mr. Brereton furnished you with information with respect to what he received for building some of these buildings down here didn't he?

1631 A. No, I didn't ask him any question along that line.

Q. You didn't have that matter up with him at all.

A. No, I had up the question with him of the cost of materials and cost of labor that entered into that class of work in Des Moines and under the conditions that existed here.

Q. You didn't want to know about what his contract called for under which he constructed these buildings?

A. Yes, I would have been very glad to know it but I would still——

Q. He was right there, why was not that inquiry made of him?

A. Because if he had a contract his contract would not enlighten me at all except as to the total figure, it would not eliminate the detail at all or enable me to form judgment upon which I could reproduce more or less in quantity than was covered by the specific contract that he had.

Q. But if he had a contract there under which he had built one of these buildings, there would have been absolute positive information with respect to this particular building anyway wouldn't it?

A. That would have been the total cost of that particular building.

Q. Yes, the total cost. Well now since you did not inquire about that we will pass that for the time. You have given me now so far as you remember the persons that you met here and talked with with respect to this property?

A. I think so.

Q. On any of your trips?

A. There were a number of assistants here with Mr. Klumpp and Mr. Brodnax that I might have met but they were——

Q. Well they were outside probably of the business con-
1632 nected with the company, they were not important in this matter that we are inquiring about?

A. I don't think it is material.

Q. That is all I want is the parties who had something to do with these values. Now were you present at any of the conferences at Chicago.

A. I was present at one meeting in Chicago.

Q. Who was there with you at that time?

A. I think the three attorneys for the company that are present were there, Mr. Douthert, Mr. Lea, Mr. Baehr, Mr. Klumpp, Mr. Heminger, Mr. Brodnax, and I think that pretty nearly covers the list.

Q. Was Exhibit 15 and 16 there, or copies of it?

A. I will have to see the Exhibit.

Q. Exhibit 15, you say you will have to see it?

A. I will have to look it over to see whether I have any recollection of it.

Q. You ought to know all about that, you have got them in your report haven't you.

A. You have my report, if you can discover it in there, it is there but not otherwise.

Q. Well didn't you put it in there or is this report made up recently?

A. Oh, I thought you were referring to some other exhibit. Yes, they had the exhibits, they had Exhibits 15 and 16, which were the descriptive matter prepared and the graphical matter prepared.

Q. And that meeting was early in February, wasn't it?

A. That is my recollection.

Q. Now what other papers, documents or figures did they have there at that time?

A. Why to my knowledge I don't know. I didn't go into
1633 any figures at that time with them and I don't know what they may or may not have had.

Q. You saw other papers and documents?

A. I saw all the papers and documents but I didn't examine them, I don't know what they were.

Q. They had blue prints there and maps?

A. They had some blue prints as I recollect it at that time.

Q. Maps?

A. I don't know whether they had maps or not, they may have.

Q. And wasn't there discussion there about *cirve* sheets, tables and so on and figures?

A. As I recall the discussion it hinged very largely on the inventories, in the first place they were discussing as to how the inventories were made up and whether they were of such nature to enable a man, an expert to use them and place valuations on them without going into too much detail himself, discussion of that character was part of it.

Q. Didn't Mr. Baehr and Mr. Lea and Mr. Brodnax tell you that they had gone over the inventory carefully and checked it all up and taken measurements to test the accuracy of the invoice and all that sort of thing?

A. Mr. Brodnax did, Mr. Lea did not.

Q. Didn't Mr. Baehr?

A. No.

Q. He had been here long before that?

A. If so, he did not make a confident of him.

Q. He didn't mention it. Now did any of these gentlemen that were as you remember it furnish any studies of life and age and methods of figuring and so on?

A. I recall some discussion with reference to depreciation.

1634 Q. Who started that discussion, who was the person who opened up the subject as you remember?

A. I would not like to say who started it.

Q. You would not like to say?

A. What I mean by that, I have not any reason for not saying if I recollect it, but I don't just remember who did start it.

Q. Was it Mr. Kulmpp?

A. I don't remember.

COURT: I expect it was some of these lawyers, wasn't it?

A. They usually start a discussion.

Q. Was it Mr. Klumpp?

A. I don't think Mr. Klumpp started the discussion, as I recollect it; Mr. Klumpp was rather quiet at that meeting.

Q. Have you ever seen Exhibit 8. Was he the only quiet one? I will withdraw that, I don't care to turn this into any matter that is not entirely serious. Just notice that, that is called Exhibit 8, did you ever see that before, that Exhibit 8 or a copy of it or the original of it?

A. The first two pages I have never seen before. The third page looks a little familiar there where it talks about contingencies and omissions. I think I have seen from pages 3 to 16. I would not state that positively because my examination of it was purely of a cursory or critical nature.

Q. That is all right, but if you did see them when did you first see them?

A. I am not sure as to the time. It might have been at the Chicago meeting and might have been at a later meeting.

Q. Let me see if I can't refresh your recollection. Don't you remember of hearing that Exhibit 8 substantially as it appears there read at that conference?

1635 A. I certainly do not.

Q. You say you think that you may have seen it at that conference, these pages?

A. Yes, sir.

Q. Now let us know the fact about it, where did you see them, when the first?

A. I have to my best recollection.

Q. Wasn't it that meeting?

A. I am not sure, I think more than probable.

Q. If it was not that meeting, where did you see it?
A. I was not its keeper.
Q. I didn't ask you that.
A. I saw it in Des Moines, I told you that.
Q. How often?
A. Probably once.
Q. When?
A. At the same period.
Q. What time?
A. I don't recollect the day or hour.
Q. Was it when you first came to Des Moines?
A. It was the second time I came to Des Moines.
Q. And that would be in March?
A. That would be in March.
Q. Was that before or after the Chicago meeting?
A. That was after the Chicago meeting.
Q. Then if you saw it in Chicago you remember now of having seen it at least twice?
A. If I saw it in Chicago, I have seen it twice. If I did not, I have seen it once.
Q. When did you finish your report?
1636 A. I have had it in the rough for, I don't remember that, probably a month or so.
Q. That is not what I asked you, when did you finish it, the one introduced here as Exhibit 22.
A. I had this typed up within the past two or three days.
Q. You have had it typed up since the testimony of Mr. Lea?
A. Yes, sir.
Q. And since the direct examination of Mr. Baehr?
A. Yes, sir.
Q. At these conferences in Chicago was there some discussion about theories and methods of arriving at the valuation of gas properties?
A. Yes, I think there was.
Q. Did you take part in them?
A. I think occasionally I did.
Q. Do you remember the discussion about the so-called element of value in property, going value?
A. That was a subject brought up.
Q. Was that discussed there among the engineers that were present and the attorneys?
A. I think the subject was talked over.
Q. And you took part in it yourself?
A. No, I think I was principally a listener.
Q. Well, did you talk some about it?
A. No, I don't think I talked anything about it because I was not familiar with it.
Q. Didn't you give your view of it?
A. No, I don't think I did.
Q. So up to that time you were not familiar with that element of value of a gas property.

1637 A. No.

Q. Your experience with respect to that commenced about the time of that conference didn't it?

A. That was the first time that I had noted that method or theory of arriving at going value.

Q. That fact is, isn't it Mr. Randolph, that you have been a witness a number of times and you have also prepared numerous reports in which you never entered or suggested any such thing as going value, isn't that so?

A. I never used that term going value, but the first thing of the kind that I can recall going into a case of this kind is much talk about the going concern and going concern value and all that sort of thing and there were opinions that were arrived at which appears to me to cover the same element but the term going value was a new name and they had tak*ing* a method of computing it which was new to me.

Q. Didn't you tell them so at that meeting?

A. To that extent I may have commented on it.

Q. And didn't Mr. Lea at that meeting give his views about this item of going value and what was the proper method of figuring it out?

A. I don't remember what Mr. Lea said.

Q. Or Mr. Baehr?

A. I don't remember either of them.

Q. And didn't some of the other gentlemen there state the method that has been adopted here by Mr. Baehr and Mr. Lea as being the right method and the one that ought to be persued in this case.

A. In the discussion do you mean?

Q. Yes, in the general discussion that took place there.

1638 A. No, I don't recall anybody pointing out that this, that or the other should be specifically used in this case.

Q. You say that was not said and done in that meeting?

A. I have no recollection of it.

Q. What was said in that meeting about these items that have been testified to here and called added costs by Mr. Baehr in his report, he calls them items 1, 2 and 3, and then taces and interest, were those items discussed there in that meeting?

A. I don't think they were as I recollect it discussed in detail. They might have been in inquiring of each man what his method was, his method may have been suggested, but it does not come back to me that any—in any way that I can answer definitely your question.

Q. Do you know Mr. Charles C. Brown, of Chicago?

A. No.

Q. You don't remember ever hearing his name do you?

A. I may have heard his name, but I don't know him.

Q. You remember such a person being at that conference?

A. Not while I was present.

Q. Well were you present all the time?

A. I don't think I was all the time.

Q. Where was the meeting that you attended?

A. It was at the Blackstone.

Q. You know Mr. Alvord? Don't you?
A. No.
Q. Was there a man by the name of Alvord present?
A. Not while I was there.
Q. Do you know Mr. Williams, a gas engineer.
A. What are his initials, I know several Williamses.
Q. Benezet Williams?
1639 A. Connected with the Chicago People's Gas Light Co.?
Q. I don't know what his business is, who he is connected with, a water works engineer the boys say?
A. Not that Williams I don't know.
Q. Do you know Col. Pratt?
A. Yes, sir.
Q. Was he present at that meeting?
A. No.
Q. At no meeting you attended in Chicago?
A. No.
Q. Now as to these so-called added costs, taxes and interest and items one, two and three, have you given them in your valuation?
A. Not in that sort of detail. I have an element in there for what is commonly termed overhead charges.
Q. What is included in the term overhead charges as you understand it?
A. As I understand it, it is the elements of interest during construction, taxes during construction, organization, engineering.
Q. Have you got those items in your report?
A. Yes, sir. I have not got them separated, I have them—they are all included in the figures given here. They are not shown separately.
Q. Have you any memorandum anywhere that shows the amount that you have added to the reproduction cost of the physical property?
A. Yes, I can tell you that. In every item of the buildings, machinery, distribution system and land value there is included an item of 20 per cent for overhead charges.
Q. You have lumped it at 20 per cent.
1640 A. I have lumped it altogether at 20 per cent.
Q. Now I will be obliged to you Mr. Randolph if you will give us the value or rather I will change that, the reproduction cost of the physical property itself free from any added items of overhead charges that you arrived at.
A. That is just a question of computation on the figures for I have got 20 per cent overhead charge included in here and these items divided by 1.20 would give you the result.
Q. It is just a question of taking of 20 per cent of the value.
A. Just a question of taking off 20 per cent.
COURT: Here you have tar extractors $1,200. The original net construction cost as Mr. Lea calls it would be a $1,000.
A. Yes, sir.
Q. Does that cover distribution system too?
A Yes, sir.

Q. You added 20 per cent to the physical valuation of the distribution system?

A. Yes, sir.

Q. For these overhead charges? Now what did you add for paving?

A. I added an estimated cost of paving which included in the first cost, I mean before the 20 per cent went on. The 20 per cent went on to the paving just as it went on to the mains.

Q. If we take your report, the figures as they appear there, and take 20 per cent off of the amount you have set over to distribution system and then 20 per cent on that?

A. No, it is the cost of the given item, let us use it as in this——

Q. I want to know how can you ascertain it from your report, how can you work it out, the paving I am talking about?

1641 A. You can't work the paving out of course, no way you can tell how much I have got in that for paving.

Q. Now you have had as you say a great amount of experience, you own now stock in gas companies, one or two at least I wish you would give us the benefit of your information as to the lowest price that you remember of just now that gas is being manufactured and sold for, and the kind of gas manufactured in this plant?

Objected to as not cross-examination, but no objection to the making the witness their witness on these matters.

A. You mean the general rates to private consumers?

Q. No, I don't mean general rates, I mean the lowest rate that gas such as is made here is furnished to consumers anywhere in the country where you are acquainted.

A. That is a very variable proposition, and——

Q. It is only one rate, it is not variable, it is just the lowest one you can think of?

A. It is hard to get at the lowest rate because they often allow special rates to special large consumers.

Q. I don't mean that.

A. It is difficult to duplicate in your mind the exact conditions existing here. These are particular conditions peculiar to Des Moines.

Q. I am not asking that at all.

A. I am going to try to answer you as fully as I can, not going to try to side step the question. The question of illuminating power comes in the value of the gas that is to be distributed got to balance that up in your mind and know whether you are comparing them alike and also take cities of equal size I should say.

1642 Q. I am not asking anything of that kind, simply asking without reference to comparison to give me the lowest price that you have in your mind now that gas such as is manufactured here is being sold?

A. That it has been sold this year, was during the past year?

Q. Yes.

A. I think 70 cents at Cleveland is as low a figure as I happen to have in mind.

Q. That is the lowest one you think of?

A. That was 70 cents, but now I come to think of it, it was raised to 80 cents.

Q. Is there any other place you think of 70 cents?

A. There are probably some places, but I don't recall them.

Q. Now what is the highest rate that you know of that you have in your mind just now for such gas as is made here?

Mr. GUERNSEY: You mean the same candle power or water gas?

Mr. BYERS: No I mean water gas, the same kind of gas manufactured here, I mean the same kind of gas made here.

A. There are places probably that sell gas as high as $2.00, possibly more, but I have not anything specific in my mind that would exceed probably $1.25 or something like that, possibly $1.50. Most places are mixed gas propositions, have both coal and water gas, a different set of conditions. This place is water gas alone.

Q. Does the difference in candle power have much of anything to do with the cost of gas?

A. Yes, it enters into it, is an element of the cost of manufacture it does not have so much to do with the price at which it is always sold.

Q. Take for instance the difference between 22 and 17
1643 candle power in Des Moines would that make any difference in the cost of manufacture?

A. Yes, it will make a difference in the cost.

Q. What per cent?

A. It will add to the cost of manufacture.

Q. How much?

A. I am not prepared to state that off hand.

Q. Well just give your best judgment?

A. That is a difference of five candle power. This is a very rough proposition, but probably nearly three cents.

Q. Is that a difference in the fuel or in the oil?

A. Practically in the additional oil that is required for bringing the candle power up.

Q. That is if there is a difference in the cost it is due largely to the difference in the amount of oil necessary.

A. That is the principal element in the cost of added candle power.

Q. You figure the difference would be something like a half a cent to the candle power?

A. Somewhere between a half cent and three quarters of a cent, possibly three quarters of a cent would be nearer the average than half a cent would.

Here the further hearing was adjourned until 9:30 A. M. tomorrow.

1644 Friday Forenoon Session.

AUGUST 4, 1911—at 9:30 A. M.

Counsel for the respective parties all present.

Testimony on part of complainant resumed as follows:

WILLIAM W. RANDOLPH, recalled for further cross examination, examined by Mr. Byers, testified as follows:

Q. Mr. Randolph, in your examination in chief yesterday, you stated there were several methods of ascertaining the value of gas properties. What, briefly, did you have in your mind as to the method, what were the several methods?

A. I don't remember in what connection I used it, whether it was past or present.

Q. Well, you stated there had been other measures or methods of ascertaining the value of gas properties than the reproduction method—what did you have in your mind?

A. The thought at the time in my mind, I endeavored to give in a general way expression to those general methods which—my recollection is I was talking about going value——

Q. No, it was in response to the question of Mr. Guernsey as to why you adopted the reproduction method and in your explanation you stated that you adopted it because you thought it was in this case the only available—I think you used the word available—it was the only method you thought could be used to reach a fair valuation. Now what other methods in that connection did you have in mind?

A. I think in that connection I must have had in mind——

Q. Here is just what you said Mr. Randolph—page 1596 of the transcript—after the question "I don't think I can tell you exactly how long." You further answered: "Ever since I can
1645 remember doing any work in this line I have been working upon reproduction, when no other measure was available. In many cases in the past there have been other measures in the purchase of gas companies available." Now what others?

A. Just what I think I had in mind was something relating to the past and in that connection I had in mind the measure of earnings, measuring the property by the earnings that was produced.

Q. Well, that is still a recognized measure, isn't it?

A. Yes, I think it is a recognized measure under certain conditions; but every specific case has got to stand on its particular conditions.

Q. Yes, that may be all true enough, but I want to get the different methods that have been used. Now in addition to the reproduction and earning power, earning capacity method you yourself have used other methods in arriving at values of gas properties, haven't you, than either of these?

A. Why I combine all known methods to me in arriving at any value of the property I want to purchase—I would want to know all about it. I would want to know the cost as nearly as I could get at it, its earning power and all the various elements that I could think of.

Q. And the reason you want to know that as a purchaser of gas property is because you recognize that all of these things have something to do with the worth or value of the property?

A. I think so; have some bearing on it.

Q. Now take this very case, for instance, the Des Moines Gas Company, if it was of recent organization; that is to say, suppose when you were called out here you were informed that the Company was organized five years ago and commenced its business new
1646 then, and had kept a complete and full record *record* of its business and its books, simply been running for five years, and you were asked to fix a value on the property how would you have proceeded?

A. Why I would have gone into the details of the books and also into the details of the physical property and seen what they had.

Q. Yes, you would have ascertained how much money they actually put into the business, what they had been earning in the business, gross and net, and all the other facts you mentioned a moment ago that might assist you in forming a judgment as to the worth or value of the property?

A. Yes.

Q. Now, in that connection, Mr. Randolph, is it not true that in at least one or more cases you fixed the value upon gas property by ascertaining its original cost to the owners of the property and then measuring or deducting the depreciation as you found it and the remainder being taken by you as the value of the physical property?

A. You mean that is one of the methods I have used in a rate case?

Q. In a valuation case—don't matter whether it was a rate case or not—in fixing value on a gas property.

Question repeated.

A. I don't recall such an instance.

Q. That method has been pursued to your knowledge very often in gas cases, hasn't it? I mean now to get at the value of the physical property—I am not talking about these added costs or items that have been referred to.

A. I can only tell you what comes within the range of my experience. I don't think I have known, at least I don't recall a specific instance where that exact method has been used in the trade or barter between individual purchasers of the companies.
1647 Those questions always come up, how much a fellow paid for it and how much he is going to sell it for and they are given for what they are worth; but to determine the question you raise is an exceedingly difficult thing, what was paid for the company.

Q. I know—you seemed to give as one reason yesterday why you accepted the reproduction theory rather than the original cost theory, yesterday you gave as a reason that it was often difficult to get the original cost and the figures for original cost were not always available. Did you mean us to understand that because these figures were not available because the cost was hard to get was the reason why you adopted the reproduction theory?

A. No, that is not the controlling factor there. When you purchase anything you purchase as of a given time and it is immaterial to you really what the other fellow paid for it and what it cost him, providing your minds have met and he wants to sell and you want to buy. If he is not going to separate himself from his property for less than a certain amount, the fact that he gave more or less for it is not a controlling factor. It is largely a question of time as to when you wish to determine the value.

Q. Well, would you as an expert adopt that theory in a rate case where it was simply a question of a reasonable return?

A. I think so; I think that as of the time that the inquiry is made appears to me would be a reasonable period for determining the values.

Q. I thought you said yesterday with considerable emphasis that your theory was that in a case of this kind and of every kind where the question of value of the property was at stake, was the
1648 theory that the owner was entitled to a return of each dollar that he put into business and that it was that dollar that went into the business and a fair return upon it that you took into consideration in measuring values?

A. Well, yes, if you can follow that, that relates more to equity.

Q. Equity is what we are trying to get here.

A. If you are getting down to equity of the original dollar that we are discussing, then if you can trace that dollar from its origin to the present time and give it a fair return——

Q. That would be your idea of what would be fair?

A. Well, I am not sure that I would. Follow that to its logical conclusion there on the facts, if that dollar was invested one hundred years ago and they had never gotten any return on it up to the present time, I don't know that I would want to make a person and future generations suffer for the errors of the past.

Q. Of course that would be an extreme situation.

A. We take extremes to illustrate the point.

Q. If I got your idea yesterday I agree with it fully, and I think it ought to —applied, if it can be, and especially in the case of bargain and sale. Now if you could ascertain from the books of this company every dollar that has gone into the business of the Des Moines Gas Company, and then in addition to that, ascertain just what that dollar has earned up to the first of January last year, that would furnish a fair basis, or at least one of the necessary items that the Master should consider in fixing the value of the property?

A. I think that would be an item I would give consideration.

Q. Now, to get a little ahead of my examination to get going value right in here, or rather, cost of development is the term you
1649 used rather than going value—in stating your theory yesterday or your notion of investment and in using this item as you call it, development of cost, that according to your theory and your method represents actual dollars put into the business, does it not?

A. Yes, that is my effort in this case, to measure the tangible

assets of the company and those things, to my mind, are tangible that you spend the money for, put the money into.

Q. You wouldn't of course add anything to the value in this property that in itself did not represent investment, would you?

A. It works itself out in my mind that this is the least value I would put on it. I would qualify that by saying that if a franchise is recognized by the law as having value, that right is theirs and it belongs to them as property and they should be given credit for it. That is a matter of law, and I am simply going along the line that I can specifically measure and be of aid to counsel.

Q. That is all right; I understand you that all the items that enter into your gross valuation in your judgment represent the actual expenditure of money?

A. As far as I have gone. I think there may be some other values there if we can measure them, but I have not yet seen how to measure anything that——

Q. Well, if it should appear—let me put another question: In arriving at these values you proceeded all the time on the theory of a fair return upon the dollar invested, haven't you?

A. Yes.

Q. And it would be impossible to arrive at anything like an intelligent valuation of property of this kind without considering a fair return, wouldn't it?

1650 A. I would find it difficult to reach a conclusion.

Q. Now with that in mind, if you could start at the beginning of this company and trace the first dollar of the investment and follow that on down to the first of January, 1911, and you were satisfied from your examination and the proof you had as to these dollars that were invested that from the beginning more than a fair return had been received by the company on each of these dollars down to 1911, there would be nothing left upon which you would want to fix value, would there, except the actual physical property that the company had to show for its investment?

A. Why, I think there would be.

Q. What would it be—what would be the nature of it?

A. I think it would be whatever they owned at that time. Now I think that this point is probably not stated with the qualification stated by me, that in thinking of *of* the past you must also think of the conditions that existed in the past. If you are going to see that a company gets a fair return, you must see that they get fair protection, you must see that they will not have to fight for their lives and are not subject to excessive hazards and all that during the early period.

Q. Well, but when people are getting a fair return on their money they ought to be able to take care of themselves?

A. They may get more than a fair return; there is no regulation, no law; the question does not come up, just the question of an open sale of whatever article you have, providing no laws or regulations are broken; it seems to me there is no reason why *why* the company should not get all the tariff would stand.

Q. Yes, that would be perhaps all right in a cold-blooded bargain

and sale deal of property; but we are dealing now with the question of a fair charge for the public use of property. Now you
1651 wouldn't contend a minute, would you, that the Master ought to allow the value or add the value of a single article or a single element, if I may use that term, to the value of the property of this company which represents something that is not used in giving the public service, would you?

A. Which is not used or useful or could be used——

Q. No, not used in giving the service for which the rate is to be fixed?

A. I would think it was all right in taking in things that were used, useful or could be used.

Q. But this company might have a lot of useful things that do not belong to the gas business at all?

A. Well, if they have got some other industries on hand not applicable to the gas business, the profit or loss of those particular departments I don't think——

Q. Suppose it had $50,000 of surplus earnings on hand in the bank, undivided profits, ought that to be added to the value of the property for the purpose of fixing a fair rate?

A. If I understand the term surplus correctly, that surplus, if it has been legitimately earned, belong- to somebody else; it belongs to the stockholders; it is for the stockholders to say where that shall be put, whether in their pockets or back into the plant.

Q. You wouldn't add it to the value of the property for the purpose of fixing rates unless it went in?

A. No, not taking into consideration surplus. It is immaterial to me whether the surplus is put into the property, whether going first into the hands of the stockholders and then coming back in some other form.

Q. If it actually goes into the property and is in the property and being used to furnish service, then I would agree with you
1652 fully it should be counted. Now suppose this company on your theory had a holder down here somewhere that was not being used in the business; they had no need for it in the business; it was down here, worth say fifty or sixty thousand dollars, but it is not connected up and it is not serving the people in any way, but it belongs to the Gas Company; now you would not add that to the value of this property for the purpose of rate making, would you?

A. If I saw that holder was there, that it could be used, that the management were not using it for some reason unknown to me, but that I could see there was a ready use for it, I would say certainly.

Q. That is begging the question.

A. I am qualifying it.

Q. I mean on the first day of January, if they had this piece of property there and if the money went back into the business and was doing a part of the service, of course it ought to be added, and I would readily admit if this holder should later be put into use and become a part of the property, then it ought to be added; but here on the first day of January they get a holder that is not being

used in any part of the connected up property, but stands there, and is worth fifty or sixty thousand dollars, that you would not add to the valuation of the property that is to be considered in fixing a fair rate?

A. If I was going to buy the property I would add it.

Q. That is, if you was going to buy and wanted to buy that?

A. And thought it was useful in the business. If you will frame a question that will show that there is something down there that they have got which is not used and cannot be used and do not want to use and I see no particular use for it in the near future,

1653 then I admit your reasoning.

Q. Suppose if they had down there in the plant the piece of machinery that is no longer fit for the business, I don't mean because it is worn out or decayed or anything of that kind, but because it is out of date and is not the thing to be used here, and if used it would not be economy, but it might be used somewhere else and it might have a value of fifty or sixty thousand dollars to be used somewhere else, would you add that to the value of this property?

A. I would in this sense, when the investment is made on a piece of apparatus of that kind, the over-period it becomes obsolete, that apparatus must be found there in the cost of your product, or in the fund set aside for it; it belongs in the cost but not as a reduction to capital; it is a part of depreciation, but not a part as a reduction from capital.

The MASTER: Here is an item on page 6, benches, $20,500.

A. I classed that in the same category with all the other elements of depreciation. I don't know but one other item, the old water gas apparatus I put an excessive depreciation on both benches and water gas apparatus; the benches are not absolutely decayed, but they come in that class you just mentioned where it would probably not be economy to use them longer.

Q. I don't want to get away from what I started to do; you get back to my question; the apparatus I am asking you about is not connected up; it would not be profitable to connect it and it could not be used in the business with the other machinery of this plant, the gas plant has outgrown it, yet it is so far as its condition is concerned, it would answer somewhere else; it would fit in in some other system, so it has fifty or sixty thousand dollars value, but is not useed in the service here and will not be, you would not

1654 add that, would you, for rate making purposes?

A. I would take some of the other elements into consideration which we talked about. I would take into consideration whether that piece of property had already been wiped out in some form in depreciation; whether it was theoretically in existence on the books and had gone into operation and was wiped out there, then that would answer itself. If on the other hand a fair return had not been gotten in that original investment, hadn't had a fair return, then I would look to see if they had a surplus and if the surplus was sufficient so that you could switch it to the depreciation

instead of into the stockholders' pocket, then it seems to me an open question as to whether it should not be considered as capital.

Q. What would the consumers here have to do with paying a return after the first of January, what do they have to do with furnishing this Gas Company a return upon a piece of machinery that was not being used to serve them at all; do you see any sense or justice in such a rule as that?

A. There seems to be some force in your statement there, but I don't think you have stated the case specifically enough for me to answer quite definitely yes or no.

Q. Let me put it in another way then so that you can answer yes or no. Suppose that the maanger of this gas company in the exercise of his discretion on the 31st day of Last December, to make an illustration more definite, say on the first of last October, had purchased at the cost of a hundred thousand dollars a piece of gas machinery, some new device that was thought would revolutionize the gas business and brought it on here to Des Moines and set it up down in the plant and found it wouldn't work at all, they could not tie it up to this system and make it go, had no use
1655 whatever so far as the people who are going to buy gas in Des Moines are concerned, but stands down here and costs one hundred thousand dollars, and it is worth something to take it somewhere else; would you add that?

A. No.

Q. Can you tell the Master where one single dollar of this five hundred thousand dollars that you added is of use in serving the consumers of this city from the first day of January on?

A. I don't know that I can; the——

Redirect examination by Mr. GUERNSEY:

Q. Had you completed your answer to that last question?

A. I was going to think loud and see if I could produce a reason for the faith that is in me that the five hundred thousand dollars as an element of cost should be added, to see wherein specifically it was serving the public. It has cost getting these new consumers and it has a loss of interest, and it seems to me those elements stand exactly in the same category as interest on the plant during the period of construction which it is generally admitted is one of the elements of cost.

Q. Now just a few words, you referred a few moments ago to two or three items including benches for coal gas which had, you said, depreciated very heavily; you depreciated one hundred per cent; now aside from the items which you so depreciated, I wish you would state what if any items you found in the plant that were not either used or useful in the manufacture and distribution of gas here in Des Moines.

Objected to on part of defendants as incompetent, as not re-examination.

1656 A. I have referred to the benches as heavily depreciated, they were not being used at the time. The water gas ap-

paratus, the two six foot sets I depreciated unduly heavily really because of physical decay in that apparatus—it is really not very great—it just looks bad because it has not been run for several years, but it is ready to run. I am inclined to think that could be classed as an emergency apparatus. Take the rest of the water gas apparatus, they are of modern type and economical in their operation as much so as any water gas apparatus that is made. The only criticism that a layman might make on that is that there are three sets there that with their combination would make in a day possibly twice as much as one day's out-put; but you have to take into consideration that the mechanism of that kind don't run indefinitely; they would have to be shut down; that the daily output of the gas must be maintained, so that you have to have spare machinery, and that comes in under the head of spare machinery and also in the class of useful machinery, so that with these exceptions at the moment, I do not recall anything down there that was not used or useful in the business. There might be some minor things.

Q. Mr. Byers asked you about the valuation of a plant that was five years old and going into the matters of cost and so on, in arriving at the value; please state whether in such a plant you would also go into the present physical condition for your value?

A. Yes, sir.

Q. You spoke about measuring the value of earnings, what do you mean by that?

A. In the ordinary talk I mean capitalization of earnings.

Recross-examination by Mr. BYERS:

1657 Q. In your examination in chief yesterday you said you had data showing the meters scrapped and repaired, have you that data with you?

A. I think so.

Q. I wish you would produce it?

A. I will tell you what it is. I don't care to let you see the original. I don't care to separate it from the rest of the papers. I have got them all intact. If you want to make a copy of it——

Mr. BYERS: I would like to have the reporter make a copy of it.

A. I could give you all the substance of the data that you want, I think.

Q. I don't care a cent about looking at any private memoranda you have. I simply called for that data and if you can read it into the record, all right.

A. What were the elements you wanted?

Q. The number of meters scrapped and the number repaired and renewed.

A. The number of meters repaired, renewed and condemned for the year 1906 amounted to 703; for the year 1907 amounted to 519; for the year 1908 to 851; for the year 1909 to 819; for the year 1910 to 536. Now while I am giving that data, I also referred in chief to a number of meters that were removed and repaired.

Q. You stated in that answer there were 45,000; did you mean 45,000 or did you mean 4,500?

A. I think I said 3,400.

Q. You said 45,000.

A. The sum of the figures I have just given you covering the period of five years, amounts, according to my figures to 3,468.

Q. Now, when I was referring to the number of meters taken out and removed I only had four years before me and I was
1658 carrying an average in my mind. I will give you the figures as far as they go; number removed in 1907, 8,708.

Q. I want the record to show, not that you are swearing now to the numbers, but that you are simply giving data into the record.

A. I am giving data that was furnished to me. In 1908 there were 8,226; in 1909, 9,482; in 1910, 9,297. Now to complete the five year period, for comparison, you would have to have the year 1906. I saw it, and saw further back the record; I not only looked over this particular thing, but looked the whole bunch over.

Q. Now what was it you gave us for 1910?

A. 9,297.

Q. And what does that number represent?

A. That represented the number of meters that were removed for one cause or another from the consumers' houses in the city of Des Moines and brought back to the company's shops and tested because every meter is by their rules tested and if found within certain limits of error, it is regarded as correct, painted and put back in the stock and ready to go out; if upon test it is not within the limits of error then it is sent off to be repaired, and if it is very bad it is condemned.

Q. That testing business is for the purpose of making sure that the meter is registering all the gas that the consumer gets?

A. It is for two purposes: to make sure that the company is getting all that is coming to it, and to make sure the people are getting all that is coming to them.

Q. Is that the plan that is followed here, that a meter must be taken out and taken to the shop in order to tell whether it is registering correctly?

A. That is the only time I understand the meter is tested,
1659 unless there is some particular cause or complaint when they specially test the meter.

Q. They can be tested right in the house?

A. They can be tested in place by a mechanism that is not as accurate as the mechanism set up in the gas company's office.

Q. Now there is one thing more, does your physical decay as you have used it in your typewritten report, Exhibit 22, include depreciation from inadequacy and obsolescence?

A. The only two cases I have given there which come under that class are the benches and six foot water gas sets. The only explanation I can give for that is inadequacy and obsolescence, but I have taken in these elements something more than decay.

Q. Aside from this wherever you have figures in your Exhibit 22 representing in your judgment physical decay as applied to the present condition of any article there is no depreciation or inadequacy or obsolescence in it?

A. No.

Redirect examination by Mr. GUERNSEY:

Q. Mr. Randolph, one word more in connection with this matter of original cost, in referring to original cost, do you mean to have us understand that when you take that into account you disregard appreciation in items like real estate or anywhere else where it may appear?

A. No; I don't mean to say I am governed by the cost; I should say that is an element and I would consider it, and also consider appreciation from whatever cause I found it to exist.

Q. To go into these meters for a moment, you gave first a list of meters that were condemned, is that it?

A. No, I gave the total condemned and repairs.

1660 Q. Do you know whether that includes meters destroyed by fire?

A. I am not sure whether it did or not. I think it is more than likely it may have done so. I have no item specifically that indicates there were any meters destroyed by fire.

Excused.

WILLIAM J. HAGENAGH, being first duly sworn on part of Complainant, examined in chief by N. T. Guernsey, Esq., testified:

Q. Your name is William J. Hagenagh?

A. Yes, sir.

Q. Where do you reside?

A. At Madison, Wisconsin.

Q. What is your business?

A. I am a Public Utility Statistician.

Q. What official relation, if any, do you sustain to the Commission of Wisconsin?

A. I am chief statistician of the Railroad Commission of Wisconsin.

Q. How long have you occupied that position?

A. I was appointed to that position the second or third day after the passage of the Wisconsin Public Utilities law and assumed my duties on August 1st, 1907.

Q. This commission you have referred to is the Wisconsin Commission that has to do with public utilities?

A. It has jurisdiction in the regulation of rates and serv-

1661 ices of all public services in Wisconsin, both railroads, local utilities, embracing telephones, street railways, water, gas and electric light and power companies.

Q. Now in connection with your work for that Commission, what have been your duties?

A. When the public utilities law was passed in Wisconsin, the commission had authority over only railroads, steam roads, and interurban and electric railways. The utility law extended its authority over all local utilities. One of the provisions in that statute was that the commission should prescribe a uniform classification of accounts for all public service corporations. That duty was assigned to me. I spent the greater part of my *fir* first year in designing such classi-

fication of accounts, together with blank forms of reports to be used by the companies in their business of reporting to the commission. The work of course embraced the preparation of such classification which would furnish to the commission all the information which it needed in connection with the work of cost analysis and rate adjustment. The conditions under which the utilities operate in Wisconsin are rather complex. Owing to competitive conditions, water companies and electric companies have combined in the interest of economy because both could use a single boiler plant. The gas and electric companies have combined because they are competitors in the field for furnishing light. The fact that many utilities in Wisconsin are owned by cities, also served to complicate the accounting requirements. The classification therefore had to embrace, not only technical problems for accounting for each utility in its own field, but it was required to be sufficiently elastic and thorough to permit of
the accounting requirements of the largest companies, such
1662 as those operating in Milwaukee, and the very smallest companies, and to permit the reporting upon the same classification of accounts where one corporation was operating two or more utility services. Another element which served to complicate the work was the fact that many companies in Wisconsin furnishing public utility service are also engaged in private service, such as large lumber companies and general stores and saw mills and logging companies; those companies often practically own the entire city and in connection with their private duties furnish utility service and in our classification of accounts we had to recognize that situation, and we spent practically a year to fit this complication of inter-relationship between the different classes of service.

Q. Now in addition to your work in preparing this classification of accounts and the reports made by the utilities for the use of the commission, what other work have you had charge of there in Wisconsin in connection with the commission?

A. In my position as chief statistician I had a force of about thirty assistants; all the companies under the jurisdiction of the commission were required to make annual reports. Those reports were all referred to my department; in connection with reviewing those reports and their analysis when the particular utility became a party in interest in a case involving rates of service before the commission. We had according to our last report something like 1,080 public service corporations and 8,000 miles of steam road reporting to the accounting and statistical department. Those reports were all classified tabulated and audited to find if there were any errors in accounting, or any studied effort to avoid the requirements of the public
utilities law. Wherever we found any inaccuracies in a report
1663 it would be necessary for some one to visit the utility in question and to audit the books. This was especially necessary when the utility became a party in a rate case. I finally reviewed all those reports before the commission and I was responsible for it and practically all of the outside auditing work performed for the commission was done by myself. This auditing covered street railways, electric light companies, telephone, water, and gas companies, and

occasionally the checking of reports of steam railroad companies having offices in *in* Chicago, St. Paul or Minneapolis. In connection with my work there I was also assigned the duty of classifying and distributing the operating expenses of the companies when they became a party to a case, and that necessitated more or less elaborate analysis of the engineering conditions of the plant, which engineering data was furnished by our engineering department, but the distribution of the accounts both operating and capital for the purpose of rate analysis was done in my department and under my direction. I also assisted in the preparation of practically all the utility decisions which the commission handed down, until a little over a year ago when I was given a leave of absence, and have been connected with the commission since then only on odd intervals on particular pieces of work referred to me.

Q. Do I correctly understand you that all this mass of accounting and reports were under you?

A. They were under my direction and much of the work I did myself. At least checked it and put my signature to the work before it was referred to the commissioners or the commission itself.

Q. In connection with the matter of the form of these reports and all this classification you refer to, having in mind the require-
1664 ments of the commission with reference to the accounts which would be material in connection with rate making, I wish you would explain the fundamental things that you wish to derive from these accounts for use in the regulation of these utilities, and why you would separate them—you referred to the capital account, for instance, and operating and things like that?

A. Our public utilities law defines and prescribes the process which the commission is to follow in prescribing a rate which is considered reasonable for the service in question, and as the basis of its work of analysis along this line, the utility law requires that the engineering department shall make an appraisal of the property and that all utilities shall keep their accounts and records in accordance with the classification prescribed by the commission. The engineering department and accounting and statistical department were therefore required to shape their work largely to suit the necessities of the commission. Our basis of rate adjustment in Wisconsin is largely on the cost theory. We do not have that absolutely; that to us is a guide. We take into consideration every other element which affects the subject. In order to determine the proper cost of a service it is necessary to have a proper and scientific classification of accounts and our classification therefore follows naturally the chronological order of service production. To be specifi*f*, I can refer to the gas industry. The first logical step to satisfy the public demand is the manufacture of gas. Having manufactured it, you distribute it. Having distributed the gas it becomes a problem for the commercial department, advertising, service, making delivery of the bills, the collection of the funds and the office work incidental to that service. The
1665 next logical step is the general office expenses, embracing salaries, expenses of general officers, taxes, insurance, and those items which are of a general and overhead nature in the course

of operation. Over and above these logical steps there are certain accounts which do not naturally fall in any one of these particular groups, which we distinguish as undistributed accounts, making it optional with the utility to carry those into the clearing account, or directly into the major groups of operating accounts. Whatever course is followed by the company must be reported in great detail to the commission. Since our companies are of the largest kind, those operating in metropolitan cities, and very small companies, our classification must naturally go farther and carry these accounts into the proper logical groups. The manufacture of gas in a small company might be reported in one or two accounts. The simplest classification would be two accounts under each group, namely, labor and material; labor covering all human service, and material including the material consumed in operation and in maintenance. Maintenance in its broadest sense would include current repair and depreciation, or what is often called deferred maintenance of the service. Our classification of accounts considers depreciation as an operating account.

Mr. BRENNAN: Is this for the purpose of qualifying this witness or to put into the record the method pursued in Wisconsin?

Mr. GUERNSEY: It is partly for the purpose of qualifying him and partly preliminary to some other matters.

Mr. BRENNAN: We object to this answer as being incompetent, irrelevant and immaterial.

Answer (continued). With these major subdivisions we classify every expenditure of the company between capital accounts
1666 and operating accounts, entering into the operating column only those accounts which according to our classification are to be charged to the cost of the service in the operating department. To these accounts as actually expended by the company we add such amounts as our analysis of the question of fairness and reasonableness in each case makes necessary, and upon that analysis we base the rate which we deem to be fair. This distribution would of course be carried further into such accounts as fixes an available portion of each expenditure to show that part independent of the output and that part directly connected with the output.

Q. You have talked mostly about operating, what care do you take to distinguish between operating and capital accounts?

A. We take the greatest care.

Q. Why?

A. That is very material to the rate. If the capital accounts were charged into the operating expenses, it would very materially increase the book statement of operating expenses or costs per unit of service; if it is charged to the capital account it is not then affecting the operating expenses nearly so much, because the operating expenses must then carry only a reasonable rate of return upon the amount charged into the capital account; whereas, if it were put in the operating account, it would have to carry all the expenses.

Q. What if any connection did you have with the preparation of the classification of accounts used by the public service commission in New York?

A. Shortly after the passage of the New Lork law, the officials of that commission decided that it would be of great advantage if all the public service commissions would follow a uniform prac-
1667 tice. The officials called a conference in New York which was attended by representatives of the Massachusetts commission, the state commission of New York, or the second district, and the first district or the Manhattan commission, and the Wisconsin commission; I was the Wisconsin commission representative at that conference. We spent about five or six weeks in New York City in preparing what we hoped would be a single classification of accounts to be followed by all public service commissions in the country. We invited to that conference representatives of several of the largest utility interests in the country in order that we might also give proper consideration to the corporation side of the problem of accounting. Owing, however, to certain differences existing in the Wisconsin law as compared with that of the New York and Massachusetts laws, the final classification- as adopted are not exactly alike, but in sufficient detail that anyone familiar with the classification may easily distribute the operating expenses. Our classification is a little more detailed owing to our greater adherence to the cost theory in the classification of operating expenses.

Q. Are you familiar with the classification of accounts which is used by the Des Moines Gas Company?

A. Yes, they follow the classification prescribed some years ago by the American Gas Light Association. That association in order to permit its members to compare operating results prepared a classification of accounts, with instructions to *to* all their companies to adopt. They had just as we have in Wisconsin large companies and small companies, and their classification embraced a major and junior classification. It differed principally from the Wis-
1668 consin classification in that it is not so detailed in its requirements. It is possible however for any company to subdivide its accounts and getting into them as much refinement as may be desired, as long as it does not violate the principal provisions.

Q. Have you made any investigation of the books of this company in which its accounts are kept?

A. I have.

Q. Have you made sufficient investigation to enable you to say whether in your judgment the accounts of the company are kept properly?

Objected to on part of defendants as being incompetent, in the form the question is put.

A. I observe that this company follows the classification prescribed by the American Gas Light Association. I have taken that classification and the accounts as carried by this company an- compared them to the accounting requirements of public service commissions and I find they do conform to the proper accounting requirements. There are, owing to the requirements of the classification they follow, some different methods of handling different accounts, but that is a matter that can be easily arranged and merely affects the question of unit departmental cost. The principles followed are proper

and they have been correctly followed and their accounts are correctly kept.

Defendants move to strike the answer as incompetent.

Q. What period did you examine?

A. The period following, as I recall, March 1, 1906, to January 1, 1911.

Q. Now, passing this question, you said a leave of absence for about a year; have you done any work during that year in
1669 connection with public utilities, if so, what?

A. I have. I secured my leave of absence for the purpose of assisting the committee on gas, oil and electric light of the City of Chicago in arriving at a proper schedule of rates for telephone service. The company there had an investment of about $23,000,000 and is furnishing nearly a quarter million telephone subscribers with service distributed over 27 different classes of service. My work for that committee was to prescribe a proper schedule of rates for the city of Chicago for those 27 classes of telephone services. Before I had completed that I was requested by the same committee to prepare and analysis of the books and records and accounts of the People's Gas Light & Coke Company of Chicago, and to report to the committee what I deemed was a reasonable rate to be charged for gas for the next five years. Both of these reports were submitted to the council committee during the spring of this year; the telephone report in May and the gas report in April. During this time I was also engaged in similar work for the Wisconsin commission and in work involving the preparation and criticism of rate schedules in other cities; those schedules being for gas, water, electric light and telephone service outside of Chicago.

Q. Now, in connection with your examination of the accounts and the method of keeping the records of this company, what study did you make of the forms and blanks used in the conduct of the company's business and what conclusion did you reach?

A. That was one of the first steps which I undertook in the examination of the company's books—I examined the forms which they
1670 use and the voucher blanks and the reports which they make of their business at the end of the year, and in the ordinary course of their business. I should say that those blanks were well adapted to conducting a business of this kind. Every company naturally adopts forms which suit the peculiarities of its own business, or the notions of the men who are to keep the accounts. In this case as far as I know the blanks are practically those which every large company could use in the conduct of its business. I know nothing about their forms to their prejudice. I should say they were designed for an economic conduct of the business.

Q. Do you remember whether you did anything towards examining and checking the authorizations during this five years' period?

A. Yes, I did. The company under its relation here with the United Gas & Improvement Company is not permitted to expend money except on authorizations from the Philadelphia office. My recollection is the amount they are allowed to expend without author-

ization is limited to only fifty dollars. This is a very decided check upon the expenditures of the local office and insures accuracy and care in keeping the account and also economy.

The MASTER: Fifty dollars for improvements?

A. They cannot expend any more than fifty dollars without securing authority from the Philadelphia office.

The MASTER: Do they pay their salaries through the authority of that office?

A. Not on the operating expenses.

Q. I believe you said you done something in the way of checking these authorizations; what was the result of this check?

A. I checked that in connection with my review of the company's maintenance accounts. In general I found that they were adhering very closely to the prescribed classification, distinguish-
1671 ing carefully between what is capital expenditure and what is maintenance expenditure. The Company has not been carrying a depreciation reserve and I therefore was interested in knowing if any replacements had been charged into the maintenance accounts and for that purpose I believe, I checked the authorization for three years. I found some accounts which I felt should have been charged to the capital account or depreciation account which have been included in the operation expenses. These of course should be deducted in order to properly show the cost of the business in question.

Q. Now in the course of your auditing of these books, what attention did you give to the vouchers for the three twelve month periods beginning December 30, 1908, 1909 and 1910 and also for the entire year 1910?

A. All the vouchers for that period were examined by accountants in my employ. I might say in that connection I have a rather large staff of engineers and accountants in my employ, and the checking of these accounts was in part performed by my assistants, but I supervised the work and approved all the classification and prepared the report. But I did personally examine every voucher for the calander year of 1910.

Q. I think in my question I referred to those periods as commencing September 30th, when I should have said ending September 30th. Did you find any vouchers missing?

A. There were a few vouchers missing. Some had been mislaid in other parts of the building by the different employees and some few could not be located at the time I requested them; so the company supplied me with a carbon copy of what I understood to be an exact copy of the voucher and which satisfied my desire for information on that particular subject.

1672 Q. Now during what period did you, or for what period did you analyze the construction account?

A. In connection with the auditing and analysis of the vouchers, we of course took into consideration every expenditure for capital purposes during these last few years. I think it was from March

1, 1906, at the time the Des Moines Gas Company succeeded to the com*a*pnies operating here before that date. I did not audit the books prior to that time but did call for and was furnished with statements showing the detailed charges to the construction account for all years prior to 1906 to as early a date as 1886. These individual expenditures I did not personally examine but I did examine the total amount added at the end of each year to the capital account, and then analyzed that total by reference to the detailed charges which were furnished to me to satisfy myself whether they were proper construction charges.

Q. Now I wish you would turn to page 24 to that memorandum which says that the construction account was analyzed from 1886 to 1910, no records being available prior to 1886, and that during these years each charge to construction was examined and traced. The memorandum I just referred to is the one marked Exhibit 23; now do you remember whether in making this audit this was done by yourself or your assistants under your direction?

A. The earlier work for the earlier years was performed by my assistants under instruction and direction from me and they reported their data to me. But the work for the last year I did personally and I performed such checks upon the work from time to time as would assure me of the correctness of their work.

Q. Take the profit and loss account, what did your analysis in that show?

1673 A. They show the earnings and operating expenses of the company for the years in question, the profit and loss statement which I prepared being carried out to the surplus for the year as shown by the company's books, to verify any inaccuracies of the company's books. In my analysis of these vouchers I learned of course of the relation between this company and the United Gas Improvement Company. I had known before this that this company was one in which the United Gas Improvement Company was interested.

Q. Now, how do those relations affect the financial strength of this company, for instance?

Objected to on part of defendants as incompetent.

A. You ask a question which is as broad as the whole utility question. The problem before most utility companies had been the financial problem, of properly providing for its financial requirements. The tendency because of these conditions and many others which are peculiar to individual utilities, has been for the formation of operating companies or syndicates either owning outright and operating many utility companies or buying control in these companies through the ownership of stock. By a single company owning a large number of utility companies, this company is able to supply the individual companies with a character of professional skill which the individual companies could not possibly afford if operating along, and the stability which is furnished to such a corporation owing to the fact it is operating over a very large territory and the interests so greatly diversified gives a very large credit to a

single company. It really amounts to in this particular instance of the Des Moines Gas Company borrowing or having extended
1674 to it credit of the United Gas Improvement Company. Ordinarily in my work of examination I would want to examine very carefully the relation between such a subsidiary company and a holding company because of the opportunity which is afforded when there is no regulation for an abuse of such relationship. I may add in this particular case I was particularly anxious to satisfy myself if there was any such abuse of the power which would be given to a controlling company by virtue of its ownership of the stock. I examined their relations very carefully for that reason, and I have not found anything which would be to the detriment of the local company. On the contrary, I would say that any utility which is a member of such a large operating family will receive substantial benefits from such control if the work is conducted in a perfectly fair, scientific and legitimate way. As far as I know the work is so conducted in this case. My attention was particularly called to that question by some of the vouchers which I met in the analysis during the year 1910.

Mr. BRENNAN: The defendants move to strike from the record the answer of this witness as incompetent, irrelevant and immaterial. Because the answer states a number of conclusions upon which the witness has no right to a conclusion and those conclusions are so intermingled with *with* the rest of his answer that it would be impossible to separate them and we therefore object and move to strike the entire answer.

Q. On page 25 you refer to the services performed by the purchasing agent of the United Gas Improvement Company.
1675 What did your examination of these records disclose in these accounts as to that matter?

A. I found in the operating expenses a charge for ten thousand dollars in the form of salary vouchers for parties connected with the United Gas Improvement Company. Some of the names I recognized and entered a question as to who the other names were and I was informed they were parties connected with the United Gas Improvement Company and that these men furnished services of a technical character, such as engineering, accounting and advice from an operating and construction standpoint. Generally, they are men of wide experience and whose services could probably not be secured by the companies at anywhere so small a compensation as that which the company pays for them.

The defendants object to this testimony as wholly incompetent and a waste of good time.

Q. Had a charge been made for those services prior to 1910?

A. No, sir; such charge had not been made during the earlier years, the company furnishing those services so far as the books are concerned gratuitously.

Q. What is the fact as to whether the Des Moines Company profited by these purchases through the purchasing agent and purchases made in large quantity by him?

Objected to on part of defendant as incompetent, irrelevant, immaterial and not the subject of expert testimony.

A. The purchasing of supplies in large quantities is one of the economies which result from a single company owning a large number of utilities. The purchasing agent will purchase supplies for all the companies or a large number of the companies in a single lot and will order shipments to be made from the factory or dis-
1676 tribution point to the different companies as directed from the Philadelphia office. The bills are rendered to the utilities at the reduced price through the economy resulting from such large purchases and those prices are often lower than what the company could obtain if purchasing them for its own use.

Q. Did these purchases go to matters of construction as well as to things used in operation?

A. I don't know exactly whether there is any restriction upon the purchasing authority of the purchasing agent. I don't think so. I believe he would purchase for all the companies just as a single company would purchase supplies. I know he does purchase a large amount of operating material, merchandise, fixtures and stoves which the companies handle. I have every reason to believe the benefits resulting from this central purchasing department apply to all classes of equipment, machinery and supplies which the company controlled by the central office would require.

Q. Did you analyze the construction account—in the middle of page 26 I see a memorandum—if so, what do those reveal, whether that account was charged with all the expenses properly chargeable to it?

A. The construction account in this case like that in most utility companies has been charged only with the cost of labor and materials and expenses directly incident to such materials which has gone into construction. In so far as I was able to determine there was not charged to the construction account those items which would ordinarily be included in the value of a plant if determined by appraisal, nor were there charged to the construction account by these items properly charged there in the course of constructing
1677 and building up the present plant of the company. I mean by that in so far as I have been able to determine there has not been charged to the construction account the ordinary appropriation for supervision expenses on construction and engineering expenses. The interest during construction and the charges which we generally call indirect or overhead expenses on the construction undertaking.

The defendants move to strike the answer as incompetent, irrelevant and immaterial.

Q. I wish you would state whether what you call here on page 26 overhead charges, embracing engineering, supervision during construction, interest and taxes during construction, salaries of officers during the construction, etc., are proper and necessary elements in the cost of such a plant as we have under consideration?

Objected to on part of defendants as incompetent and the witness is not competent to testify.

A. They are and are so provided for and prescribed in our Wisconsin classification.

Q. How about the New York commission, do you know whether or not such items are treated by the New York Commission as proper elements of the cost of construction, such as this gas plant and distribution system?

Objected to on part of defendants as incompetent and not the best evidence.

A. I have not refreshed my memory on their classification for some time. My recollection is they do specifically provide those charges shall be made to their capital.

Q. Now I wish you would refer to page 27 and take up this question of depreciations.

A. I referred to that a moment ago, I probably anticipated your question. The operation of the company results in wear and
1678 tear of its service; at the same time there are such forces as obsolescence, inadequacy and supercession applying to the property, all of which lead to a division of the so-called repair accounts into the current maintenance and depreciation. All these charges due to the current wear and tear of a plant in operation are strictly maintenance accounts. When however over and above current wear and tear, obsolescence, inadequacy or supercession of the property, replacements are required which are in the nature of extraordinary renewals or replacements, these should be charged properly to a depreciation reserve which has been set up through credits and corresponding charges to the operating expenses for the purpose of representing the estimated depreciation of the property during the year in question. This cannot be determined with accuracy but the best one can do is an approximation. The company in this case has not carried such reserve and I therefore looked carefully at the vouchers to see if replacemony have been charged in the maintenance account, and I found some evidence of that to a small degree.

Q. Referring to the bottom of page 27 of the report, what would be the eventual result if this policy is continued of not building up a depreciation fund?

A. The inevitable result would be to show a large investment on your books as a plant account and a very small present value of the property representing such charge on the books, and if an appraisal were taken of the property at that time it would show a very disappointing result as compared with the book figures or capital liabilities of the company outstanding. It would mean that the stockholders' property has gradually disappeared and been consumed in operation.

1679 Q. It is legitimate to consider as profit the net earnings until there has been deducted from that a proper provision for these items of future depreciation you refer to?

Objected to on part of defendants as incompetent and immaterial.

A. No, sir; neither ordinary business nor law would regard the difference between actual current operating expenses and gross earnings as representing profits.

Q. You refer to a second method of taking care of depreciation in the last paragraph of page 28; will you explain what you had in mind there?

A. I said one method of caring for depreciation through building up the so-called depreciation reserve which would be built up out of charges to operating expenses; another method, one which has been followed a great deal especially up to within the last two or three years has been the method of making no charge to operating expense for depreciation, but at periodical intervals creating the crediting the construction account thus reducing the amount standing on the books and showing the investment. The result however is practically the same because a corresponding charge would have to go on the profit and loss account. It is a book keeping transaction. In this way it does so reduce the property account and to that extent recognizes the element of depreciation.

Q. Now, I see on page 29 of this Exhibit 23 a reference to three per cent per year on gas plants as an accepted depreciation rate. Will you please state what the fact is about that, what in your judgment would be a fair rate of depreciation to charge against this property on account of this future depreciation not taking care of any ordinary maintenance and repairs?

1680 A. The rate of depreciation is a matter which is very difficult to determine with any degree of accuracy. In order to determine correctly there should be an analysis of the character of all items of depreciable property of the plant, a study of the type size and the age of the property, and a computation of its composite life. That calls for information which I at the time I prepared this report did not have, and as the depreciation rate is not the same for all gas properties, I preferred to leave it to the engineer's analysis of the property here. In the absence of such analysis a rate of three per cent of *of* the depreciable property has been very often used. The rate is based upon the more or less generally accepted idea that the composite life of the average gas plant operating in a large city is approximately 33⅓ years. In general my experience leads me to believe that three per cent on the depreciable property is rather high, rather than accurate. That I really refer to the engineers here and in the absence of that data have used this for an assumption.

Q. Now, you state from an analysis of the maintenance account it appears that certain items have been incorrectly charged as current maintenance and that they are depreciation replacements or capital charges. Will you refer to Exhibit 7, a part of this Exhibit 23 that presents the detail of this matter?

A. That distribution of maintenance accounts there shows that my analysis reveal- charges to maintenance accounts which should have been charged either to capital or depreciation reserve, if such a one had been carried on the company's books. Since I made some

computations where an allowance for depreciation became
1681 material, it would have been unfair against the subscriber for service if I had added such a depreciation allowance to the present operating expense. I therefore had to make an adjustment by reducing the operating expenses to the amount of incorrect charges, and when so reduced add back to the amount a fair allowance for depreciation in so far as I could at that time compute it.

Q. Return to schedule 5 and see whether under columns adjustments, debit and credit, we have the matters you have just been referring to?

A. I have there for the years 1908, 1909 and 1910 made the adjustments through crediting the operating account with the amount which I thought was incorrectly charged to it, and then charging such balance with what I felt was a reasonable allowance for depreciation, and then deducting such total operating expenses from the gross earnings for the years in question, it gave me according to this computation, what I believed was the proper net earnings, after making an allowance for depreciation and it is very much lower than what the books show to be the net earnings.

Q. Referring again to this column headed adjustments, I wish you would state what the items under the sub-head debit in schedule 5 shows.

A. The debit item shows my allowance as assumed on the basis of three per cent of the depreciable property for depreciation. I don't want to be understood as saying just now that that is the proper amount, because it was not computed upon a basis such as I would ordinarily follow. My engineering staff was not engaged upon this work. I had no engineering data whatever regarding this plant and in the absence of that I used the ordinary rate of three per cent to give me a sort of trial figure, what really the net
1682 earnings were.

Q. You show your results contained in schedule five after your depreciation is deducted for these four periods; also at the end of this Exhibit 23 that is devoted to the subject of depreciation?

A. Yes, sir.

Q. They are compared with the net earnings as shown by the books without your corrections?

A. Yes, sir.

Q. Did you append to your report some more schedules—we will take them up in their order—take schedule 1, that is what?

A. That is the balance sheet or statement of assets and liabilities as of December 31, 1910, taken from the books and verified by the men under my direction to be correct.

Q. The next is schedule 1, Exhibit A?

A. That shows the investment in the plant on March 1st, 1906, and the adjustments through additions to the construction account and a charge to profit and loss on account of depreciation which was made in 1909. The final figure there shows the plant account as contained in the balance sheet at the close of that year.

Q. Before you leave that, you stated this was an adjustment by

the additions to the plant account; are those the items that make up $525,360.76?

A. They are.

Q. What is the item charged off on account of depreciation?

A. That is the second method of making a credit to the construction account and the corresponding charge to profit and loss. During the period I examine the books of the company there had been no adjustment other than this single item.

Q. What was the amount of the item?

1683 A. $264,108.78. Now that might be assumed as being the only provision for depreciation at the Des Moines Gas Company during its corporate existence.

Q. Now, what is schedule 1, Exhibit B?

A. That is a tabulated and classified statement of charges to the construction account from 1886 to 1910. These items embraced in the total at the right hand margin of the page were in a much greater refinement on the books of the company, but for simplicity they have been condensed under the five principal heads embraced in this table. The table shows the total charges to construction from 1886 to 1910 on account of this plant as $1,928,016.65.

The MASTER: The figures in red there, what are they?

A. Credit during construction. The black figures represent charges. You notice in the total instead of adding anything to the property they actually reduce the property account by $149.

Q. Now what is Exhibit C to schedule 1?

A. Exhibit C, schedule 1, shows the inventory of the stock of merchandise of the company at the close of business December 31, 1910.

Q. And Exhibit D to schedule 1?

A. That is a classification of the accounts receivable of the company.

Q. And Exhibit E to schedule 1?

A. That shows merely the single item of cash which the company had in the bank in its current working funds at that time.

Q. And Exhibit F of schedule 1?

A. A schedule of the stock account as shown on the company's balance sheet.

Q. That is an item of the capital stock in schedule 1,

1684 Exhibit A and schedule 1 also.

A. Yes, sir.

Q. And what is Exhibit G to schedule 1?

A. That is merely an analysis of the bond account shown on the general books. It shows the amount of bonds authorized, the amount issued, the amount outstanding, and the characteristics of the bond, and the amount of bonds issued from time to time, making up the present outstanding liability on account of this issue.

Q. And it explains the items of bonds in the first page of schedule 1?

A. It refers back to schedule 1, the item of bonds on the liability side of the balance sheet.

Q. What is Exhibit H to schedule 1?

A. That is an analysis of the preferred stock contracts which were

issued in 1906, but which have since been reduced to the present amount of $411,000, and refers back to the third item on the liability side of the balance sheet in schedule 1.

Q. Then is Exhibit I to schedule 1 in the same way a detailed statement of the accrued accounts, making up the item $58,817.07 in the balance sheet?

A. It is.

Q. Exhibit J is what?

A. That is a statement of the profit and loss of the company shown from its books at the close of business for the calendar year December 31, 1910.

Q. And is explanatory of the item profit and loss on the balance sheet?

A. Yes, sir.

Q. What is Exhibit K to schedule 1?

1685 A. That is an analysis of the company's revenue accounts. It also shows the income and the cost of the appliances and fittings and merchandise handled by the company, showing the net profit or loss from each of such department-, which refers back again to the profit and loss account for the year in question. The total also shows the quantity and cost per unit of the boiler fuel used by the company, the generator fuel, oil and purification supplies.

Q. For instance, taking that, your cost per unit appears under the word "rate."

A. Yes, sir.

Q. Coal, so much a ton?

A. Yes, sir.

Q. The oil is by the gallon?

A. Yes, sir.

Q. That is something under three cents?

A. Yes, 2.8.

Q. What are the purification supplies that you get by the bushel?

A. They are all supplies the engineers describe in the purification process as shavings, corn cobs sometimes, usually the general purification material embraced in the stock account for that purpose.

Q. What is schedule 2?

A. That is a statement of the profit and loss covering 12 month-ending September 30, 1908.

Q. And what is Exhibit A to this schedule?

A. That is an analysis of the revenue which the company has received from gas sales and sundry sales. The table also shows the cost of manufacturing material and supplies, both the quantity, the unit rate and the amount for that year.

1686 Q. What is schedule 3?

A. Schedule 3 shows the statement of the profit and loss for the 12 months ending September 30, 1909.

Q. And Exhibit A to that schedule is what?

A. That contains the statement of the revenue from gas and sundry sales of the company, the cost of its manufacture, materials and supplies, showing both the quantity and the rate and the amount expended for the year.

Q. What is schedule 4?

A. Schedule 4 shows the statement of profit and loss similarly prepared for the twelve month- ending September 30, 1910.

Q. What is Exhibit A to schedule 4?

A. That shows an analysis of the revenue account of the company for the year embracing gas sales and sundry sales; also the cost of the manufactured material and supplies, showing the quantity and rate and the amount included in the operating expenses for that year.

Q. What is schedule 5?

A. It is the one I have referred to already as an adjustment of the operating expenses for these four periods, containing a debit on account of my estimate allowance for depreciation, and a credit on account of adjustments which I made, of what I considered incorrect charges to the operating expenses.

Q. It also shows the gross revenue and operating and net as shown by the books.

A. Yes, it shows the corrected net earnings.

Q. What do you mean by fixed charges?

A. They really cover interest on mortgage liabilities, interest on bonds.

Q. Now, referring generally to these schedules, 1 to 5
1687 inclusive, included in Exhibit 23, and to the exhibits to these schedules 1 to 5 inclusive, I wish you would state whether they were all made up by you or by your employés under your supervision from the books of the company and whether they correctly show the facts set out in them as shown by those books, except this matter of adjustment in the last schedule you have referred to.

Objected to on part of the defendants as incompetenr, irrelevant, immaterial and not the best evidence.

Mr. GUERNSEY: As to not being the best evidence, the situation is this: for about three weeks perhaps, the accountants for the city have been working on these same books. We have not brought the books in here, but we can bring every one of them if they want them. Under the circumstances I don't think the objection ought to be made because the books are not here, or if it is made we ought to be permitted to interrupt the work the city's accountants are doing on the books.

Mr. BYERS: The trouble, Mr. Guernsey, is in the form of your question.

Mr. BRENNAN: You ask if this correctly shows the condition of the company's books.

The MASTER: This evidence may go in and if there is any question about the books, they can be introduced hereafter.

Mr. GUERNSEY: The question is made now. I want to ask counsel whether they require us to bring them in?

Mr. BRENNAN: No, but this witness ought not to be asked if this shows correctly the condition of the company's books.

Mr. BYERS: It is the form of the question we object to.

Mr. GUERNSEY: I think I know what counsel have in mind and I will change the form of the question.

1688 Q. I am not asking you Mr. Haganagh, to state whether the books are correct, but what I want to know is whether these exhibits, and this is what I think I asked you before, correctly show the matters that are contained in them as these matters appear upon the books of the company, except only the adjustments indicated by you in schedule 5?

Objected to on part of defendants as incompetent, irrelevant and immaterial.

A. These schedules and exhibits have been prepared from the company's books in the city of Des Moines. The work was performed largely by men in my employ and under my direction. The work of preparing and writing the report was done by me personally. I personally examined all the vouchers for the year 1910, and except for such typographical errors as may have crept into it, it is a correct statement of the condition of the company's books.

At this time an adjournment was taken until 1:30 p. m.

1689 1:30 P. M., FRIDAY, *August* 6, 1911.

W. J. HAGENAH Being continued on direct examination by N. T. Guernsey, Esq., testified as follows:

Q. Mr. Hagenah, just as we adjourned I asked you to take up the matter you have discussed in this Exhibit 23 under the heading value of investment and state whether you have made a valuation of this property based upon the investment and state in detail how you made this valuation and the reasons for it?

Objected to as incompetent, irrelevant anl immaterial.

A. In financial statements and schedules described this morn' I confined myself solely to the actual cost of the gas property and these profit and loss statements as shown by the book. The cost of the plant, however, does not represent the full investment upon which the stockholder in that plant is entitled to a reasonable rate of return. He is entitled in all fairness——

Mr. BRENNAN: To avoid interruption here by objections I would like to have the record show that in all cases where the witness endeavors to decide what is a reasonable return for the investor that testimony is objected to as being incompetent and a subject upon which the witness has no right to volunteer or express an opinion.

COURT: That will apply to each and every question and answer and each and every part of the answer without being repeated.

Mr. GUERNSEY: No objection to that.

A. It is my belief that the investor is entitled to a reasonable rate of return not only upon his voluntary investment or the
1690 actual money which he has expended in the physical plant but that he is entitled also to a rate of return upon the in-

voluntary investment which he has named and an audit of the *the* company's books will show only the actual cost on the company books. In order to find the value of the property or rather the investment which the stockholder possesses and upon which he is entitled to a rate of return it is necessary to go farther than the mere cost of the plant and to consider all the elements of value. These elements embrace the reproduction cost of the property new, the reproduction cost new of the property less this depreciation to show its present value. The cost of the plant in dollars and cents to the stockholder as he has actually built it up from year to year through expenditures and additions to the plant. The stock and bond account of the company and also its gross earnings and net earnings. There is no mathematical rule, there is not one single principle by which the value of any property for rate making purposes can be computed. It must be determined from the consideration of all these elements of value giving proper weight by one whose judgment is as such reinforced by experience as to give it value. In order to determine therefore what the value of this plant for rate making purposes should be I have gone further than the mere analysis of the book accounts which I stated this morning and as contained in this report to be roughly $1,928,000. I say that the investor is entitled to a return over and above that amount because of the involuntary investment which he has made. The amount shown on the books of this company is merely the value of so much dead material, steel, brick, apparatus for manufacturing gas and
1691 the labor element which have gone into it. It contains no item of expense *wo* represent the value of the company as an actual live operating going and revenue producing corporation. Such a corporation, such a property, or the investment representing that property is the amount which in a rate case should be used as the basis for applying the reasonable rate of return. Now plants, referring to public utilities companies, seldom produce a profit from the first year of their operation. In common law and under all our rate regulating statutes in this country a public service corporation stands in an entirely different light than a private corporation. As a public service corporation it is entitled to charge only such rates as will yield a reasonable rate of return upon the investment. Without considering now what that reasonable rate is the stockholder or the investor in a public utility company can never charge more than what constitutes a reasonable rate. If he does not secure that reasonable rate of return upon his investment he is incurring losses which must be met by someone and in this particular instance of the public service utility owned by individuals these losses fall upon the stockholder. A public utilities industry and its business is developed at considerable hazard and through the expenditure of large sums of money. That money must go for example in paying cost of advertising soliciting, demonstrating the cost of introducing the public to the values and benefits of its service. It goes to the depreciation of the plant. If now a rate of return or the price of gas which the company is charging is not large enough to meet

the necessary operating expenses together with depreciation, there is incurred in the operation of that plant a deficit and a
1692 definite loss which must be assumed and borne by the stockholder. If one should engage in a private business he would be enabled in later years to recoup these losses which he incurred in the early years. Since, however, he cannot when in this industry charge a higher rate than one which will yield a reasonable rate of return these losses which are incurred in standing by the utility business during these periods of deficits should be considered as a part of the investment. In a private business a man may retire from the business the moment he finds to his satisfaction that his investment is not profitable and may remove from the city entirely and engage his enterprise in some other city. In the utility business the moment his investment is made it is fixed and there is no choice on the part of the investor. He must stand by his utility furnishing public service even at a loss until such time when he fails or leaves the field entirely or remains only in the hope that some day the public will appreciate the service and use it to the extent of giving him that reasonable rate of return to which he is entitled in law. If for example a man has made an investment in his plant of $1,000,000 and finds that during the five or ten years of his operation he loses five thousand or ten thousand per year, the amount of his investment upon which he should be entitled to a reasonable rate of return should not be the mere physical value of his property but that value plus the amount of loss which he has sustained. If these losses are not considered as part of the investment then the application of what constitutes a reasonable rate to the investment will not yield that reasonable rate becauuse the actual in-
1693 vestment is larger than the investment upon which the rate of return is computed. If therefore the investment shown by the books is one million dollars and the accummulated losses are $200,000, the application of the specific rate to the one million dollars would not yield the reasonable rate to which the investor is entitled by law but will give him a rate considerably less per cent and therefore the accummulated losses must be considered as a part of the investment and the rate of return computed upon the investment so increased or else the amount which is deemed a reasonable rate should be increased to the extent that during the years of prosperity the stockholder will have returned to him these amounts which he has originally expended in standing by his plant during the period of development. Since a public utility——

COURT: This is an argument rather than evidence.

A. I merely want to outline this for the table I built upon these elemtents of value as shown on the company's books.

COURT: Yes, but it is argument just the same.

Mr. GUERNSEY: We thought it was not improper to have the witness state the reasons which impelled the Wisconsin commission to adopt their system.

A. It is this explanation or argument or logic whatever you want to call it which led the Wisconsin Commission to adopt a basis for

computing going value entirely different from what had ordinarily been used before that time. We build our going value table therefore from an analysis of the company's accounts and analysis of the losses during the period of development on the theory that these losses represent the amount which must be added to the physical value in order to determine the fair amount which in a rate
1694 case must be considered as the actual and reasonable investment. This theory of the Wisconsin commission differs from the other elements of going value which have been discussed in that a plant may have a large going value but it does not necessarily follow that the value must be allowed in a rate case. That is the distinguishing feature between this and other methods of computing going value. And carrying my statement a little farther if a company in later years after its plant has been formally established is earning more than a reasonable rate of return the excess in such earnings over and above a reasonable return that would apply to wiping out the going value which had accummulated during the years of the company's unprofitable operation. If then a company lost money for ten years and was very profitable for ten years, it is entirely possible and in many utilities it is a fact that for rate making purposes the element of going value which at one time was actual has been entirely wiped out since it has been earning extra profits which the stockholder has received during the period of prosperity and a portion of the losses have been recouped and he has received from and on account of his investment the amount which is deemed a reasonable rate of return on his investment. On that theory I have prepared a table——

COURT: What page is it on?

Mr. GUERNSEY: The fourth page from the end, page 42.

A. In order then to determine not whether the company has a going value, but whether the element of going value should be considered in this rate case, I have prepared the tables in this report. The table covers the years from 1887 to 1910. That is a table where depreciation is computed at two and one half per cent, the
1695 first of these last two tables. Going back to the beginning of 1887 the company's books show an investment which according to Exhibit "B" of schedule 1 of my report amounts to $285,383. I consider that which is the actual cost as the investment of the company at that time. The investment consists not only of the physical property but an amount to be considered as reasonable working capital at that time and that amount from an analysis of the company's balance sheet I place at $13,600 as I recall which is the working capital at the beginning of 1887. My second assumption for this table is that reasonable rate of return for the Des Moines Gas Company is 8 per cent. Eight per cent on this investment for the year 1887 would yield $24,719. During that year the company added to its investment $18,394. Since this investment is as well entitled to the return as that which was put in at earlier periods and since the construction was being carried on throughout the year I have applied that rate of eight per cent for only six months.

That gives an interest on the construction for the year during the period when we can assume it was in service in the amount of $736. Their operating expenses that same year as shown by the company's books amounted to $51,753. I have assumed for the purpose of this table that the depreciation of the company's property was at the rate of two and one half per cent on the depreciable property. This would amount to the application of the rate of two and one half per cent to the investment less land and working capital, making then for depreciation $7,497. Now the question arises how much during this year did the stockholder put into the business and then how much did he take out of the business. If he put into the business more than he took out that year he sustained a loss for the
1696 time being. If he took out more over and above his expenses than 8 per cent certainly no going value for *are paming* purposes occurred during that time. To prove this I add in the next column all the preceding figures to determine what total amount the investor up *ro* this time has put into the business which *es* $412,082. Through the operation of the plant that year he took out the business in the form of gross earnings, $78,793 leaving the value of his investment on the 8 per cent basis at the end of the year $333,289. That is the condition of his investment at the end of that year and consequently the next day which is the opening*ing* of the new year. During that year he is entitled to 8 per cent. He added to his plant in the form of physical property and he added to his working capital. The investor is entitled to the 8 per cent for six months upon such addition. His operating expenses are shown in the next column. Likewise the depreciation. Then I again add the total amount which the investor put into the property during that year and subtract the amount which he took out of the property showing that the investment at the end of 1888 was $381,821 this amount representing his then physical property plus the condition of his loss or profits as computed on the 8 per cent basis. The amount at the close of this year is again carried forward for the beginning of the next year and this process I have carried on from year to year for *for* every year during the time the accounts of the company can be obtained giving me a total investment value on January 1, 1911 of $3,343,394. In this table I have assumed that 8 per cent was the reasonable rate of return on investments of this Character and in this particular instance that the depreciation allowance should be two and one half per cent of the depre-
1697 ciable property. These two items are largely a matter of judgment. In order to arrive at any figure which I would want to use as the basis of valuation in a rate case I would want to compute the going value upon different basis*es* or assumptions. So I have prepared another table allowing again 8 per cent as the reasonable rate of return and assumed that *the* depreciation during these years had been at the rate of two and three fourths per cent on the physical property. This table is compiled on exactly the same basis as the one described but gives a somewhat higher valuation of $3,484,586.

Q. Have you also since you made this report and after a further study of the situation compiled a final computation?

A. I have.

Q. That I believe is being type written now?

A. Yes, sir. This report and these returns which I have just described were prepared and submitted on March 8th. After I arrived in the city and familiarized myself to a greater degree with the records of the company I came to the conclusion that the amount which I had assumed as a fair allowance for depreciation was probably high and that in the interest of the consumer and subscriber for gas service a somewhat lower rate for depreciation should be used in all justice to the public and I think that the two and three fourths per cent which I used giving a valuation of $3,484,586 is too high. I worked the table over again on an 8 per cent earning basis, however, but placing the depreciation at two and one fourth per cent instead of two and one half per cent. Now that table has just been completed and is being typewritten and I have no*y* a copy of
1698 it here but the amount shown to be the fair investment value at this time and upon which I would apply the 8 per cent is $3,240,000. I made a further analysis assuming without knowing definitely because I did not have the necessary engineering valuation data when I made these tables that my two and one fourth per cent for depreciation was still too high and I worked the table out again on a two per cent allowance for depreciation which appeared to me as being a reasonable and conservative allowance. On that basis of computation my final valuation is $3,136,241. To say definitely what I would consider the fair value of this property for rate making purposes would be a process of analysis, would require a process of analysis in which I would examine these tables and the reproduction new of the property, cost as shown on the company's ledger, its earnings, all its financial exhibits and I would certainly have to come to the conclusion that the amount upon which the rate of return which should be allowed for the benefit of the stockholders on January 1, 1911, was, the very minimum from all these analyses roughly three million dollars. My tables here, the one which I think most conservative, that of 8 per cent for the rate of return and two per cent on the depreciable property to reimburse or replace property through wear and tear or general depreciation, is $3,136,241.

Q. I wish you would state again whether the method you have adopted here is the method which is adopted by the Wisconsin commission in making its valuations where these data are available.

Objected to as incompetent, irrelevant, immaterial and calling for a conclusion of the witness.

A. In our early rate cases there we were confronted by a maize of——

1699 COURT: That don't answer the question.

A. This method was used in the case of Hill vs. Anigo Water Company and appears in the printed decisions of the Wisconsin Commission. That is the first time that method was used. It was used again in the Marinette and Menominee Light & Traction case. Further used in the case of the state journal prin*gint* Co.,

against Madison Gas & Electric Company and in all rate cases since that time we have worked outgoing value upon this basis as an element to determine the value to be considered for arriving at what is a fair value upon which rate of return should be computed.

Q. Recurring to something you mentioned this morning, $1,928,016.65, which you referred to as cost as shown by the books, I wish you would state whether that includes what we have denominated overhead charges.

A. There is no evidence on the books showing that it does. It is possible that the amount——

Defendant moves to strike out the answer and I think this witness ought to be cautioned and informed he is simply here to answer questions and to testify.

Mr. GUERNSEY: I think you were answering my question.

A. I could only answer there is nothing on the books showing that overhead charges had been included in the construction account.

Q. You made this estimate from the books?

A. Yes, sir.

Q. You have no personal knowledge of these transactions back there in 1886, 1888 and 1890 and so on.

A. No, sir; they are just copies from the ledger and the details which go to make up the total as shown on the ledger do not show any charges for the indirect expenses for construction pur-
1700 poses.

Q. Now I asked you this morning something about whether the so called overhead charges were allowed by the New York Commission in construction account for gas companies. I wish you would look at the book that I now hand you and state whether or not this is the book prescribing the method in which the account of gas companies are to be kept as shown by the order of the commission there in the second district which is in the first part of the book.

A. Yes, I recognize it as a copy of the classification of accounts prescribed by the second district commission of New York state that is the public service commission.

Q. I wish you would look at the bottom of page 15 here and read into the record such requirements as you find there with reference to these so called overhead charges during construction and how they are to be taken care of. I have the right place have I.

Objected to as incompetent, irrelevant, immaterial.

A. On page 15 of this classification of accounts appear the instructions for charging to the construction account expenditures incurred during construction, for engineering and superintendents, law expenditures, injuries during construction, taxes during construction and miscellaneous construction expenditures which embrace such items as the general office, clerical salaries and insurance and items of that general nature during construction.

Q. And on the top of page 17 what have we?

A. On the top of page 17 is the item of interest during construction also chargeable to this account.

Defendant moves to strike from the record the matter just
1701 read therein for the reason the same is incompetent, irrelevant and immaterial.

Q. Have you also before you a copy of the classification of the Wisconsin Commission relating to the accounts of such companies?
A. I have.
Q. Is that the classification which you referred to this morning which was prepared by you?
A. Yes, sir.
Q. As we do not intend to put it in the record, about how many pages has it?
A. It embraces the classification for I should say roughly between five and six hundred pages.
Q. And what is the size of the book?

Objected to as irrelevant and immaterial.

A. I don't remember the dimensions, it is probably four by seven inches.
Q. A bound book?
A. Yes, sir.
Q. Counsel for the city asks me to ask you whether it is bound in leather. Please state whether this copy is so bound?
A. This copy is, but the commission do not bind them in leather for general distribution.
Q. Now will you please turn in that classification to the requirements of the Wisconsin Commission as to these overhead charges and state what are these overhead charges they recognize as part of the capital account.

Objected to as incompetent, irrelevant and immaterial.

A. On page 79 of the classification prescribed for gas utilities and on the several succeeding pages are instructions to charge to the construction account such items as salaries during construc-
1702 tion, office supplies and expenses during construction, stationary and printing during construction, law expenses during construction injuries and damages during construction, insurance during construction, taxes during construction, interest during construction, miscellaneous during construction and a discussion of the subject of treatment of discounts on bonds issued for construction purposes.
Q. Is engineering specially mentioned?
A. It is not specifically mentioned in any accounting here. It is covered by instructions to charge engineering and superin*rents* during the construction to the construction account. It is not the subject of an account title.
Q. I will ask you to state Mr. Hagenah whether this paper marked complainant's Exhibit 24 shows as the same appear upon the books of the company the revenue and the operating expenditures of the complainant the Des Moines Gas Company for and including the

first two months of 1906 when the property was owned by the Capital City Gas Light Company and then for the twelve months ending February 28, 1907, the twelve months ending February 29, 1908, the twelve months ending February 28, 1909, the ten months ending December 31, 1909, and the twelve months ending December 31, 1910.

A. It does.

Q. And does it also show the various items per thousand cubic feet of the operating expenses?

A. It does.

Q. I wish you would state whether you have yourself since you have been here checked this Exhibit 24 with the books of the company and whether or not it is correct as shown by these books?

1703 A. I have checked this against the company's books every item of revenue or expense except one single item in the first column amounting to $32.40 I did not check because the book in which that was happened to be in use at the time and I have not had access to it since then, but just that one item $32.40. Excepting that I have verified every other figure on the statement.

Q. And what is the fact as to whether this exhibit 24 is correct, that is whether it correctly shows the facts which it purports to show as they appear upon the books of the complainant and for the first two months on the books of its predecessor.

A. It correctly shows the revenue and operating expenses in detail for the period shown on this table with the additional addition to show the operating costs and revenue per thousand cubic feet.

Cross-examination by R. O. BRENNAN, Esq.:

Q. Now Mr. Hagenah, I understand you to say that you are an expert statistician?

A. Yes, sir.

Q. You are not a consulting engineer?

A. No, sir.

Q. Don't pretend to be?

A. No, sir.

Q. You have attempted to tell the Master the various methods pursued by regulatory bodies in arriving at the valuation of gas plants and water plants?

1704 A. I have indicated simply the method which we had adopted for Wisconsin and the various methods which we considered in arriving at such valuation.

Q. Also methods pursued to some extent at least by the commission in New York State.

A. In so far as their accounting classification goes which they have used there for rate cases, but I don't know their position.

Q. As I understand you you were employed by the commission in Wisconsin to classify and suggest methods for keeping accounts for public utilities within that state?

A. Yes, sir; and further than that I was made chief statistician of the department and that was one of my duties, my first duty in connection with the organization of the department.

Q. What other duties did you perform in the organization of the department in that respect?

A. Examined all the reports made to the commission by all public service corporations of Wisconsin.

Q. Those were checked over by you to ascertain whether they had been filed in accordance with the rules of the commission.

A. And the accounts had been kept as prescribed by the commission.

Q. Did you go over the books of the respective companies to ascertain whether they were correct, is that part of your duty?

A. In many instances if the report showed any error which we could not correct through correspondence or showed great discrepancy, or an effort to avoid classification I would go to the office of the company and verify the report or prepare a new one.

Q. You got a leave of absence when?

A. July 1, 1910, which has been extended on two occasions since then.

1705 Q. When did you take up your work for Chicago?

A. I went to Chicago the first time in connection with my work there I think on the 26th of June 1910 to make a preliminary survey of the situation.

Q. And when did you first come to Des Moines in connection with this case.

A. February 18, 1911.

Q. Had you been in Des Moines prior to that date?

A. No, sir; my first visit to the city.

Q. Did you come to Des Moines in pursuance to some correspondence?

A. Yes, sir.

Q. Or by telephone message?

A. Correspondence.

Q. Who corresponded with you with reference to your coming to Des Moines?

A. I received a letter—I presume you want the first letter?

Q. Yes.

A. The first letter I received in regard to the Des Moines work was received about the 24th or 25th of January, it was written to me by Mr. G. W. Curran of Philadelphia.

Q. Mr. Curran is an officer of the——

A. Comptroller of the United Gas Improvement Company.

Q. And that was the first communication you had received with reference to the Des Moines case from that source?

A. Yes, sir.

Q. Was that in relation to your employment in Des Moines in connection with this case?

A. As I recall that letter Mr. Curran wanted to know what my work was at that time and if I would be available to pass upon some questions which he might want to submit to me involving the

1706 question of classification. He stated I believe in that letter that the company with which he was connected was interested in the Des Moines Gas Co., and that there was some difference in regard to the rates in the city and what he would want me to pass

upon was the question of the classification of accounts which the company was keeping.

Q. He told you in that letter that the inquiry involved the question of rates?

A. I recall it so, at least I understood that was what the difficulty was over.

Q. And that was the only information that you had on that subject is what you received from Mr. Curran, wasn't it?

A. At that time, yes.

Q. That was in January 1911?

A. Yes sir.

Q. About the 24th I think you said?

A. I think the letter was posted in Philadelphia the 24th of January, I probably got it the 25th or may be the 26th.

Q. You were in Chicago at that time were you?

A. Yes, sir.

Q. From whom did you receive the letter asking you to come to Des Moines in February?

A. I think from Mr. Curran. If I might explain in answer to Mr. Curran, if that is material——

Q. It might be later on, but I wanted to know now——

A. I told Mr. Curren, in my reply that I thought I could pass upon the matter that he had in mind but no specific arrangement was made at that time. I received a letter later asking me if I could come to Des Moines with him for the purpose of look-
1707 ing at their classification.

Q. About what was the date of that letter?

A. I don't remember, but it must have been, that would be just assumption, possibly eight or ten days after the first one.

Q. You referred to the first letters about the 25th of January?

A. Yes, sir.

Q. I presume you answered that by return mail?

A. Probably answered it the same day, I think so.

Q. Then you got another letter in due course of mail from Mr. Curran?

A. Yes, sir.

Q. In which he asked you if you would be in position to go to Des Moines with him?

A. Yes, sir.

Q. Well from this it was about the early part of February you came out here?

A. No, I came on the 18th of February.

Q. Did you meet anyone else connected with the United Gas Improvement Company besides Mr. Curran?

A. Mr. Curran was bound for Des Moines at that time and I met him in Chicago on the night of the 17th, he was accompanied by a young man from his office in Philadelphia and I went with them to Des Moines leaving Chicago on the night of the 17th.

Q. Upon your arrival in Des Moines on the 18th how long did you remain?

A. I went back to Chicago Sunday night on the 19th being here two days.

Q. When did you next return to Des Moines?
A. I came out here again on the 26th and stayed here one day.
Q. 26th of February?
A. Yes, 26th of February spending Sunday in Des Moines.
1708 Q. Leaving Sunday night for Chicago?
A. Yes I want back to Chicago Sunday night.
Q. When did you next return to Des Moines?
A. March 5th, I was here one day.
Q. On Sunday.
A. Sunday.
Q. You left Sunday night again for Chicago.
A. Yes, sir.
Q. When did you next come out to Des Moines?
A. I think I came here the next time the day this trial opened, I think that was the 12th of July.
Q. How many assistants did you say you had from your office employed here in the gas office?
A. I had one man here in Des Moines who was here five days, my chief accountant.
Q. What was his name?
A. Charles A. Honecker.
Q. He was here five days?
A. Yes, sir.
Q. During what part of the year 1911?
—. Mr. Honecker left Chicago on the night of February 28th and left Des Moines going back to Chicago on the night of March 5th. That is the same night I went back to Chicago. We went back together.
Q. Was he out here after that?
A. No, sir.
Q. Was anyone representing your office out to Des Moines?
A. No, sir.
Q. Mr. Honecker spent five days in Des Moines?
A. Yes, sir.
1709 Q. Of which time you were here one day?
A. During these five days yes I was here Sunday.
Q. He went with you back to Chicago Sunday night?
A. Yes, sir.
Q. Is your contract of employment from the United Gas Improvement Company?
A. No, sir; from the Des Moines Gas Company. I have no contract if by that you mean a statement in writing.
Q. No, I don't mean a written contract, I meant Mr. Curran on behalf of the United Gas Improvement Company requested you to come out to Des Moines?
A. Yes, as comptroller of the United Gas Improvement Company which owned this property.
Q. I am not asking you now what your contract was as to the amount but did you arrange with Mr. Curran, the amount of compensation which you were to receive for your services in this case?
A. No, sir; not at that time.
Q. Did you afterwards?

A. Not until about five or six days ago I think it was.

Q. Made your arrangements with whom at that time?

A. Mr. Curran spoke to me about it, asked me if I had rendered a bill and I said I had not. Later Mr. Haines requested me to file my bill since the matter had been pending so long and they wanted to have mine closed for the time being.

Q. They made settlement with you for the amount of services?

A. Yes, I rendered my bill and received a check for it.

Q. Just a few days ago was it?

A. Not over three days ago.

1710 Q. You say you were employed by the city of Chicago.

A. Yes, sir.

Q. In connection with some investigations down there?

A. Yes, sir.

Q. Were you employed by the city council of Chicago?

A. No, sir; by the committee on gas oil and electric light which has a membership of about twelve or thirteen aldermen, and this investigation was referred to a sub-committee of three with whom I dealt occasionally but my principal relations were with the chairman of the sub-committee.

Q. You were employed through this sub-committee of the city council.

A. Yes, my negotiations were entirely with the chairman of the sub-committee.

Q. What were you employed to do in Chicago?

A. To make an appraisal of the property of the Chicago Telephone Company and the People's Gas Light & Coke Company to make an audit of all their books, records and accounts, make an investigation of matters which I deemed material to the question of rates and to prepare from such material what I believe was a reasonable and proper schedule of rates for the service in question.

Q. And you were to make an appraisement of the property as well?

A. Yes, that did not necessarily mean, however, I was to do that myself. I was given authority to build up a staff for all this work but I was to supervise it.

Q. You are not familiar with nor pretend to be familiar with unit values that go into construction of a gas plant or water plant or other public utilities are you?

A. I am not an engineer, but in my work on the Wisconsin

1711 Commission on rate cases I have figures which refer to the making of many appraisals and the analysis of public service corporations and I am in a way familiar with it although not an engineer.

Q. You did not expect yourself to make this appraisal in Chicago so far as physical property was concerned?

A. Oh no. Just direct the methods which were to be pursued on the properties to be valued.

Q. And employed engineers for that purpose?

A. Yes, but I had a wide discretion in arriving at what should be the elements of value in each case and how it should be compiled.

Q. I believe something has been said in this case about a meeting of engineers or some of them or their counsel at the Blackstone Hotel in Chicago. Were you present at any of those meetings?

A. I was present at one meeting at the Blackstone.

Q. At what meeting were you present?

A. I am really not familiar with the transaction there, I did*n* nit know until I heard some testimony here that there had been several meetings. I attended one which was on Sunday February 12th I went to the meeting about noon time and I learned then that there had been a meeting before that time, I stayed to dinner with a number of men connected with the gas question in Des Moines and spent the afternoon with them. That is the only time I ever met any people in connection with this case in Chicago.

Q. Was that before you filed your report in this case which you read this morning?

A. Yes, this report I filed here is dated March 8th. I met
1712 there February 12th.

Q. That was also before you filed your report with the city council in Chicago or with this committee?

A. Yes, my gas report there was filed I think April 17th which was the day after Easter and the telephone report was filed I believe May 2d. So it was before all these reports were filed.

Q. What was the general nature of the discussions that were had at this meeting at the Blackstone Hotel?

A. I did not participate in any general discussion or general meeting. My part in the conference was to discuss with the members present but not all the members of the conference were in the room at the time, this method of going value which I explained to the court here today.

Q. That was discussed there was it?

A. Yes, I outlined what we call the Wisconsin Commission Method.

Q. Did any other engineer outline for the benefit of those present his personal views with respect to some method?

A. As I recall it there were in the room at the time I explained my method no other engineers except Mr. Randolph was there. I met other men there but they were not in the room at the time I explained my method.

Q. Mr. Baehr nor Mr. Lea were not?

A. They were not in the room, they were there, but were not in the room when I discussed my method.

Q. Were they about the hotel?

A. Yes sir. I met them before dinner and I believe they were at the dinner table with us.

Q. Did you meet Mr. Alvord at the hotel in Chicago?

A. No, sir.

1713 Q. In connection with any of these conferences?

A. Not at Chicago.

Q. Did you talk with him at any other place in reference to this case and theory which you were going to evolve or outline for the benefit of the Master in this case?

A. No, sir.

Complainants object to the question because it assumes the witness is going to evolve a theory for the benefit of this case which is not in accordance with the facts.

A. No, sir. I met Mr. Alvord only once, was merely introduced to him and never have discussed the question of values with him.

Q. Did you submit to the people of Chicago in your report the same theory of going value in that case that you have in this?

A. I did in the gas case.

COURT: I have heard Mr. Alvord's name repeated two or three times here. Who is Mr. Alvord?

Mr. GUERNSEY: He is a water works engineer who lives in Chicago.

COURT: I could not understand what *was* the reference was to Mr. Alvord is the reason I asked the question.

Q. Mr. Walvord you know is the same man who was out here in the water works case in Des Moines?

A. I met him in Des Moines, I was introduced to him in the hotel here, I was in his presence not over two or three minutes I am sure.

Q. You met him here in Des Moines?

A. Was introduced to him here.

Q. When was that?

A. I don't remember the date, it was one Sunday.

1714 Q. One of those visits you were here in Des Moines?

A. Yes, one Sunday.

Q. That was your first meeting with Mr. Alvord?

A. And the only meeting with Mr. Alvord, yes.

Q. Now you think you advanced the same theory for going value in your report to the city council of the city of Chicago?

A. Yes, sir.

Q. In the gas case?

A. Yes, sir.

Q. Now in that case you understood to recoup the company for the early losses which it incurred in getting rid of competition and for the moneys which were expended on behalf of the company ostensibly for the purpose of securing franchises.

A. No, I have not allowed in that amount which I assumed as going value in Chicago any allowance for franchise value.

Q. But didn't you conclude from your investigations that the stockholders of the Peoples Gas Light Company when they formed their reorganization and got rid of certain competition and secured certain franchises that there had been expended in that behalf some twenty or thirty millions of dollars but that as a matter of fact but about ten millions of that went outside of the company and that therefore you concluded that about ten millions would be fair and just to be considered in connection with the going value, isn't that true?

A. Not exactly. I think you have put certain elements into your question which I eliminated in my analysis of that account on the Chicago Gas Company's books. You have some of the elements in there.

Q. You did recommend the allowance of ten million dollars as going value did you not in your report?

1715 A. Approximately that amount, I don't remember the exact figure.

Q. In what manner did you arrive at that ten millions in that case?

A. The Peoples Gas Light and Coke Company, do you want me to go back through the——

Q. I would like to have you tell just in a general way by what method you arrived at ten millions as representing the going value?

A. The Peoples Gas Light and Coke Company of Chicago as at present constituted is the consolidation of a large number of gas companies which prior to 1897 had been engaged in bitter rate wars. It had been the policy of the council of Chicago during a great many years following 1855 to issue franchises for gas companies for the purpose of inciting and inducing competition. As soon as any single company seemed to be making money or at any rate some member of the council believed that they were making money, some people in Chicago thought it would be the proper method and policy to pursue to enfranchise another gas company. The result was that as soon as any gas company became comfortably established on its feet it was forced into competition with another company. The second company would enter the same field construc- a plant, to satisfy the same district, lay mains in the same streets, which were already supplied with mains and engage in a competitive struggle to master the gas business in that particular district. My theory is that a public service corporation having a franchise for the purpose of supplying the public with a public service should be given that franchise with the least possible restriction and with the least possible obstruction in its operation. Since the company can-

1716 not avoid engaging in a rate struggle and since to compel it to engage *it* in such struggle is contrary to all reason and political economy——

Q. I think you are getting far outside of the scope of the question. I want to know this, in making your valuation for the city of Chicago of the property of the Peoples Gas Light and Coke Company if you allowed in connection with the valuation anything which represented expenditures made by that company or its predecessor on account of moneys expended in securing franchises or whether you eliminated that feature entirely from your report?

A. Tried to eliminate that feature entirely from my report in so far as I was able I did.

Q. Did you allow anything in the sum for franchise?

A. I made an effort to exclude that wherever I could determine it on the books.

Q. But you allow do you not something for it?

A. Not intentionally or not knowingly. I made a special effort to eliminate it.

Q. Isn't it a fact in your report ten million approximately you allowed as going value represented items of that character?

A. I did not.

Q. Are you still serving the city of Chicago in connection with their investigation of litigation which has grown out of your report?

A. I left the service of the city of Chicago on July 8th.

Q. 1911?

A. Yes, sir.

Q. And since that date a suit has been commenced by the Peoples Gas Light Company against the city of Chicago?

1717 A. I noticed that in the newspapers.

Q. Did you get any other information from any other source?

A. No, sir.

Q. Except the newspapers?

A. That is the only information I had on it.

Q. I believe you said that in Wisconsin they attempted to arrive as nearly as possible at the actual cost of the utility in fixing rates.

A. When you say actual cost do you mean cost of operation or investment cost?

Q. I mean the actual investment?

A. We try to arrive at that to use it as one of the elements in arriving at the value upon which the rate shall be applied.

Q. In other words you endeavor to know just what amount has been invested in the property from its inception and installation up to the time of the inquiry with respect to the rates.

A. Yes, we try to analyze the construction plant.

Q. And try to know what the actual investment is don't you, the amount of money actually put into the plant?

A. We want to get at that yes.

Q. You want to know what their buildings cost don't you?

A. Yes, sir.

Q. And what their holders or other apparatus cost?

A. Yes, sir.

Q. You want to know the actual cost of the distribution system?

A. Yes, sir.

Q. Every part of the plant?

A. Yes, sir.

Q. In this report that you make Exhibit 23, you have found a valuation of this property of something over three millions

1718 of dollars approximately three millions as I understand it?

A. I would call that the value of the investment, not the value of the plant, just a little distinction of the term.

Q. You make a distinction between the value of the investment and value of the plant?

A. Yes, the plant I would call the physical property and the value of the investment the amount upon which 8 per cent ought to be applied which would be the physical property plus any other allowance which might be found necessary?

Q. You did attempt to ascertain what the actual investment was in the city of Des Moines?

A. Of this company, yes.

Q. And your figured go back to the year 1887 do they not?

A. My figures or analysis of the construction account goes one year earlier than that June 30th, 1886.

Q. You have used some figures commencing at that date and I wish you would tell us from what source you received that information, that is to say the amount which you used in this report as representing the investment of the company in 1886.

A. That is taken from the company's books, the ledger.

Q. You have no way of verifying that except that you adopt these figures from the books?

A. The first figure of course I would have to adopt, I had nothing prior to that or any means of ascertaining it.

Q. Now in your summaries the way you have worked out this valuation I will ask you if you have considered in connection with the valuation of the investment anything for mains below pavement?

A. Only to this extent where the main was laid by cutting through pavement and the pavement restored the cost of such restoration appears in the records of the company and that amount only
1719 is included in the construction account.

Q. So that you arrived at the value of the investment of three million dollars without considering the item at all of mains under pavements?

A. Only in so far as the books show that the company has actually cut through pavement and restored pavement.

Q. That is to say if a main or service has been constructed in advance of the pavement or at a time when a street was being repaved you make no allowance for that?

A. Not unless the company incurred any cost in connection with it in which event it is on the books and this table embraces no items not on the company's books.

Q. I wish you would tell me if you will, on December 31, 1910, what the actual amount invested by the company was as of that date?

A. $1,928,016.65.

Q. Now can you tell from your report the amount of gas that was sold by the company up to that time?

A. In cubic feet?

Q. Yes.

A. No, sir.

Q. Haven't you got it summarized there each year?

A. The gas sales each year.

Q. Yes, that is shown in your report is it not?

A. No, sir.

Q. Is there any way by which you can refer to this Exhibit 23 and tell us the amount of gas sold by the company up to the 21st day of December 1910?

A. No, I could not. There is no information that is accurate on that subject in this report. I have not analyzed the sale
1720 statement to determine the volume of gas sales.

Q. Do you know what the receipts of the company were up to that date from all sources, the gross receipts?

A. I have in my totals the gross earnings of the company for the years 1887 to 1910 inclusive but it is not totaled. Shows it for each year.

Q. Do the books and records which you examined show the receipts for the years preceding 1887?

A. My recollection is that the company has no books prior to 1887.

Q. They have no books?

A. No, sir.

Q. Showing any transactions prior to the year 1887, is that your understanding?

A. No, sir; I inquired for them, but have been unable to secure any records prior to that date. The company then was very small and I presume the same practice prevailed, they became lost. I at any rate have seen no records prior to that.

Q. Did you ask for any records prior to that date?

A. Yes, I wanted to get this back to the date of incorporation if possible.

Q. When was the incorporation do you remember?

A. I don't know when the orifinal company was incorporated, the Des Moines Gas Company I think——

Q. That was in 1906?

A. Yes, sir.

Q. The Capital City Gas Light Company, do you know when it was incorporated?

A. No, sir; I do not.

Q. Can you tell us from your report what the total revenue received by the company from the year 1887 to December 31, 1910 was?

1721 A. I have the column of figures here, there is no total to them. It is not added but the data is here.

Q. Do you have it in years as shown by your report?

A. Yes, 1887 to 1910.

Q. You have shown here the last column of page 42 Exhibit 23, the value of plant at the close of the year?

A. Yes, sir.

Q. Does that have anything to do with the income from sales of gas?

A. Yes, it is computed in this way as I have explained, consider each year what the stockholder put into the business and what he took out and determine loss and profits for that year and make adjustments, used this cumulative progressive analysis and gives the financial transaction from the period of 1887 to 1910.

COURT: That means upon 8 per cent interest upon the investment including depreciation from the time you begin until you close.

A. Yes, at per cent on the losses which are shown by considering depreciation as operating expenses during this year and they do not actually set aside anything to deprecation, reduced by applying profits which the company make during the same time showing a net deficit accumulating plus physical property equal to the amount at the bottom of the last column.

COURT: And that has tripled as I understand in about 22 years 'nasn't it?

A. Well during that time of course the plant has grown, the valuation has increased from $308,000 to $1,928,000 the books cost has increased that much.

COURT: That is three times the actual investment, three times the actual money put in?

1722 A. No, not quite twice. The actual money put in is $1,928,000, the construction account is $1,928,000.

Q. As I understand this table at page 42 you have shown for instance for the twelve months ending June 30, 1887, in the first column the value of the plant at the beginning of the year $308,383.

A. That is 983.

Q. Does that represent the actual investment up to that point?

A. The actual investment in plant plus the amount of working capital shown by the balance sheet on that day which as I recall it was $13,600. I may be wrong, may be one or two hundred dollars difference but it was 13,000.

Q. That includes the working capital outside of actual plant at that time and represents working investment?

A. Yes, sir.

Q. The next column you have 8 per cent of the value of the plant. That is to show to the credit of the stockholder 8 per cent of that amount?

A. Yes, sir.

Q. In the next column you show the additions to the plant?

A. Yes, sir.

Q. Including the working capital?

A. Includin*d* additions to the working capital during that year. that is the average addition.

Q. Then in the next column you show 8 per cent on additions to plant including working capital for six months.

A. Yes, sir.

Q. And the next purports to show the operating expenses for that year.

—. ——.

Q. The operating expenses of $51,755 that I take it you secured from the books of the company?

1723 A. Yes, sir.

Q. You made no *ettort* to check that over to ascertain if that amount was correct?

A. No, I didn't go over the individual vouchers. That is the total operating expenses from the closing of the books.

Q. The depreciation was two and one half per cent on depreciable property that you have incorporated into this report to carry out your theory, that you did not get from the books did you?

A. No, that is in this report on the statement of the details of plant, investment, schedule 1 Exhibit B and in order to find the depreciable property that year I deducted from the total that appears in this page the amount which does not depreciate which is the land.

Q. If I understand you right the company in 1887 did not take off anything for depreciation.

A. No, sir.

Q. Kept no depreciation account in other words?

A. No charge for it.

Q. You have stated that in your report by including it in this report?

A. Yes, sir.

Q. Now the column under the heading total, does that represent the sum total of all these other columns preceding?

A. That is the total of the foregoing six columns.

Q. You have gross earnings in the next column, $78,793.

A. Yes, sir.

Q. What information did you receive to lead you to believe that amount was correct?

A. That is taken from the ledger at that time and is checked against the ledger to verify its accuracy.

1724 Q. There were no vouchers or anything to show that amount was correct?

A. No, I did not go over any subscribers' ledgers to verify the total.

Q. They have no books prior to that time?

A. Not prior to that time but they had for that year.

Q. For 1886, that is prior to June 30, 1886, the company as far as you know have no books or records?

A. Yes, I so understand.

Q. So that assuming that your report is correct in that respect taking this first item—I do this for the purpose of getting your view point, under the first column $308,983 represents the amount actually invested as shown by the company's books.

A. In plant and working capital.

Q. And for the month of June 30, 1887, the value of the plant at the close of the year by including these several items, you arrive at the conclusion that the value of the investment was $330,289.

A. Yes, sir.

Q. Now how much of that is represented in so called overhead charges?

A. Not any of it in this way unless the company has during that year charged these overhead expenses which would properly be construction charges into these operating expenses. I don't know the amount.

Q. Do you know anything about it whether they have or not?

A. I don't know the amount, no sir.

Q. Would that make any difference if they had in your computations?

A. It would not affect the result, but it would affect some

1725 of the columns in this table. The amount which had been charged to operating expenses for that purpose and should have been charged to construction account and show as an addition to the plant during that year. Since both these columns are

added in the total it would not affect the total at all. This automatically adjusts that.

Q. The $18,394 representing additions to the plant including working capital that is the additional working capital, did you check that over to find out if that was correct?

A. I checked the total construction of this amount and then asked for the detailed expenditures that went into that amount and in that way verified the amount before the table was made up.

Q. Do you know how much additional capital was added?

A. Working capital?

Q. Yes.

A. I assumed there — an average of $5000 per year. If I may explain if I had analyzed the balance sheet each year during this period it would have shown some years the working capital materially increased and take some years it might have been slight, another year the particular day the books were closed the working capital might have appeared rather small——

Q. What I am getting at is if you can tell us——

Judge CARR: I think the witness ought to be allowed to complete his answer.

A. I merely wanted to add this statement. I computed the working capital at the beginning of this period and the working capital at the close of the period and then took the average increase each year which would give exactly the same answer as if I analyzed each balance sheet over these years.

Q. Take that balance sheet for 1887, I want to ascertain
1726 how much you include for working capital, how do you find it.

A. You will find it by referring to Exhibit "B" of schedule 1, the last column. That column shows the additions to the physical property that year.

Q. Schedule I, Exhibit "B" additions to plant 1886 to 1910?

A. Yes, sir. You will find that the additions to the physical property that year were $13,393.52. Wherever an amount of cents is in excess of 50 I make it $1.00 and where less than 50 I drop the cents, so if you will refer now to the table of going value you will find that the addition to plant that year is $18,394 which is equal to this figure from schedule 1, Exhibit "B" plus the $5,000 representing average increase in working capital over these years.

Q. You just assume that there was added to the working capital for the year 1887 this $5,000?

A. I assumed that the avarage was added because I know what the working capital was at the beginning of this period and I know what it was at the conclusion of the period. I can see from the earnings there and expenses that the business has greatly increased and I can safely assume that the working capital has kept pace with such advancing balance sheets. Rather than work it out each year I carry each year the average increase in working capital shown to have actually occurred over these years.

Q. In making your estimate for working capital if you take the

working capital as shown upon the company's books during the years covered by this report, or whether you have assumed a certain percentage to represent working capital covering that period.

A. No, sir; my working capital data is taken from the balance sheets of the company, no assumption.

Q. Each year you show in this report do you what the
1727 actual working capital for the company was for that year?

A. I am afraid we don't understand each other. There are here a period of twenty three years. I have seen the balance sheets for all these years and I have worked out the working capital for each of these years. In some years the advance is so much as fifteen or eighteen or twenty thousand dollars.

Q. What I want to know is, do you find anywhere any working capital account?

A. There is no working capital account on the books. It is balance sheet information.

Q. You get that showing how much that was each year?

A. I really take it, yes.

Q. How did you get at the working capital account.

A. From an analysis of the balance sheet.

Q. How do you analyze the balance sheet, in what way?

A. For determination of working capital?

Q. Yes.

A. Analyze the cash account, inventory account, accounts receivable and accounts payable.

Q. The reports or records which you saw on the question of extension of mains, did the company's books show the actual cost to the company for those mains?

A. Yes, and that is shown in detail in Exhibit "B" schedule 1 of my report.

Q. Extension and improvement, the first column page 5 of this report that represents the item to which I have called your attention?

A. It does not include mains if tha- is what you are inquiring.

Q. What does that include?

A. Includes land, buildings, and station manufacturing equipment.

Q. So that on June 30, 1886, $189,423.33 represented all
1728 these values.

A. Yes, sir.

Q. That includes real estate as well as the other property.

A. Yes, sir.

Q. Did you inquire as to how much they paid for the real estate or did you accept the company's statement?

A. I accepted the book figures.

Q. Do you remember whether the books you saw had any record of the amount which had been paid for real estate?

A. I believe they did.

Q. Were you furnished by the company with any information aside from the books with reference to that?

A. No, sir.

Q. Have you treated that in any other manner in this report except to accept the figures of the company?

A. No, sir; merely taken the ledger figure.
Q Now where are the mains and s-rvices shown here?
A. Mains are shown in the third column and services in the 5th column.
Q. That is extension of street mains?
A. Yes, sir.
Q. This $62,618.82 represents the amount paid that year for extension does it, extensions of street mains?
A. Yes, but that being the first year it represents the main account on the books. You see the company have been operating some years at that time. This represents the value of its street mains at that time.
Q. All the street mains?
A. Yes, sir. The item below that would be the amount for that year?
Q. Do you remember how many miles of mains they had at that time?
1729 A. No, sir. I saw a record of it, I don't know what it is.
Q. Had invested in meters $14,380.80.
A. Yes, sir.
Q. Invested in services, $18,957.10.
A. Yes, sir.
Q. $295,385.08, what does that represent?
A. That is the total cost of the plant as shown by the books on June 30, 1886.
Q. Now I believe you made some reference to the be-efits that accrue to this company on account of the fact that the United Gas Improvement Company had taken it under its wing for which they already received at least in 1910, $10,000.
A. Yes, sir.
Q. And I believe you wanted to give the inference that the Des Moines Gas Company was somewhat of an infant industry and needed the protection of the Uni-ed Gas Improvement Company, was that the thought?
A. No, I did not care to give any inference like that. I hadn't that idea in mind at all.
Q. You say economy can be practiced by having the advantage of a purchasing agent in the buying of materials and things of the sort.
A. Yes, you will secure more favorable prices that way.
Q. Do you know how much money the Des Moines Gas Company made say, in the year 1910, on account of these advantages to it?
A. No, I could not determine that.
Q. Did you try to determine it?
A. Whenever I pass on a matter of that kind I always like to satisfy myself that the company is not squandering the money, that it is not merely a device to pay money over to the holding company.
1730 Q. What I am getting at is did you attempt to inform yourself on that subject as to how much the company had actually earned by reason of this advantage?
A. I made some inquiry about that, yes.

Q. Did you satisfy yourself?

A. To the extent that I believed it was a good investment to spend the $10,000 a year.

Q. How much had they saved?

A. I don't know how much they saved, I didn't carry it all the way through.

Q. You didn't carry it through. How far did you carry the investigation.

A. I made inquiry and I also saw from the vouchers the prices which this company was paying for material which it was securing through this central purchasing agent.

Q. Can you recall any particular item upon which you noted there was considerable saving to the company?

A. While I have no specific figure in mind I recall that the company was getting very favorable prices on gas stoves and fixtures which were being purchased in very large amounts at the Philadelphia office and distributed among the subsidiary companies. The cast iron pipe I believe that was also true of them, although I have no specific figure in mind. I recall though at the time that they were getting good prices.

Q. Do you know what the company was paying for cast iron pipe in 1909?

A. I don't recall the figures, no sir.

Q. You could find that out for us could you?

A. The vouchers are in the company's files, I went over these vouchers for one year.

1731 Q. In making up your report here showing the actual amounts spent for street mains, you ascertained did you not how much they were paying for cast iron pipe in that year 1909?

A. No, Mr. Brennan, in making up the table to which you refer in the report that is taken from the ledger and the ledger figure would not show the cost per ton of pipe.

Q. Did you just adopt the amount which the ledger showed as being expended for extensions?

A. In all years except these last few where either I or my assistant checked the vouchers to see that the money had actually been expended.

Q. The vouchers would show the amount that had been actually paid by the company for cast iron pipe in 1909.

A. Yes, for all supplies and material purchased.

Q. Can you get that information for us?

Mr. GUERNSEY: Are these the same vouchers the city's experts are now working with?

A. Yes, the same records.

Mr. GUERNSEY: Then I think he ought not be asked to do it at our expense. I have no objection to his doing it at their expense.

A. I have not the figures in mind. They are on the records which the accountants are working at now.

Q. Do you know whether the company bought pipe any cheaper in 1910 than it did in 1909?

A. I had no specific recollection or any item on that.

Q. Or these extensions or supplies sold?

A. I don't remember, I have no specific recollection of that.

Q. Did you notice any material decrease in the cost of materials to the company in the year 1910, as compared with 1909, or 1908 or any of the other years?

1732 A. There are some fluctuations of accounts and amounts paid but much of that is due to the general market fluctuation. If any concessions are made they are concessions from the list and concessions from the market prices and would reflect more or less some general fluctuation of the market price.

Q. Were you shown the contract between the Des Moines Gas Company and United Gas Improvement Company?

A. No, sir.

Q. With respect to this matter?

A. No, sir.

Q. Did you inform yourself with respect thereto in any way?

A. No, sir.

Q. Did you inquire if there was a contract?

A. No, sir.

Q. Were you advised by any one that such a contract was in existence.

A. No, sir.

Q. Did you attempt to inform yourself as to the general scope or nature of this contract?

A. I don't know there was a contract. I don't recall ever having heard it mentioned.

Q. Do you know why it was the company paid the United Gas Improvement Company the sum of $10,000?

A. Yes, because some of the employés of the United Gas Improvement company were from time to time sent to Des Moines for the purpose of giving service in this city and as soon as they were through here they would go back to Philadelphia. They received for that a salary which is more or less nominal.

Q. Didn't it occur to you as somewhat singular to find an item for the year 1910 in the sum of $10,000 notwithstanding the services referred to by you had been performed through other years.

1733 A. It did in this sense attract my attention because it did not show up in any of the preceding years and I did ask officials of the company for an explanation of that and they told me that the service had been rendered during those years, but it was not until 1910 that it appeared on the books.

Q. Now did the $10,000 item purport to pay the United Gas Improvement Company for the service rendered during the year 1910, or did it purport to cover past service as well?

A. My recollection of that is it applied only to the year 1910, salaries paid monthly.

Q. It is your notion, is it, as an expert statistician, that the Des Moines Gas Company, considering the length of time that it has been operating in the city of Des Moines considering the fact that it is enjoying a monop-ly in this city, considering the fact that it is serving the number of consumers that the record in this case shows

that it is serving, that it is necessary and advantageous to pay to some other company the sum of $10,000 for these accompanying privileges.

A. In this specific instance it is advantageous to do that though I should not say necessary.

Q. What did the Des Moines Gas Company or the consumers get in return?

A. They got the service.

Q. What service?

A. These men they paid salary.

Q. What did they do, what services were performed that could not be done by Mr. Haines, Mr. Vincent and the staff here in Des Moines?

A. Representatives of the United Gas Improvement engineering department make frequent trips to this city for the purpose
1734 of inspecting the operating condition of the company as to the degree with which the gas plant is capable of satisfying the demands of the company. They make the proper design for extensions and improvements at the plant, representatives from the financial and auditing department come to this city to examine the company's books and make periodical audits here.

Q. You understand this company at least ostensibly is an Iowa corporation organized under the laws of the state of Iowa under the name of the Des Moines Gas Company?

A. Yes, that is the name.

Q. With certain officers?

A. Yes, sir.

Q. And directors mentioned in the articles of incorporation and their successors in office, you understand that don't you?

A. I assume, I have no recollection just now, I assume it is an Iowa corporation.

Q. You know Mr. Haines has been recently made the president of the Des Moines Company a corporation organized and existing under the laws of Iowa do you not?

A. I learned that from hearing Mr. Haines testify in this case.

Q. Now can you conceive of any good reason why any operative business man or corporation would pay to some other corporation the sum of $10,000 for the privileges which you have stated here to the Master and then expect the consumers to pay for that.

A. I think the consumers are receiving the better of the bargain.

Q. In what way, I wish you would tell the Master.

A. Because this company is receiving the benefit of technical experience of men in the employ of the United Gas Improvement Company without any other charge against this Company.

Q. Well don't you think that the United Gas Improvement
1735 Company would be subserving some interests of its own by paying this money?

A. The United Gas Improvement Company stands in the position of a stockholder and I presume any stockholder that took any interest in his investment, but if he did any other work outside of

his interest as a stockholder or director he would probably want to be paid for it.

Q. Do you know the United Gas Improvement Company is a stockholder in The Des Moines Gas Company?

A. I have been told that.

Q. A stockholder?

A. Yes, sir.

Q. How much stock does it own?

A. I believe it owns practically all of it. I have not made an examination of the books, I made inquiry and was told it controls all the stock.

Q. It is the United Gas & Improvement Company as far as the consumer is concerned?

A. No, sir; it is the Des Moines Gas Company.

Q. Now the United Gas Improvement Company own all the stock of the Des Moines Gas Company and all of the principal officers are in Philadelphia and they are interested in performing this service are they not?

Objected to as argumentative and as to getting very close to arguing a legal proposition and therefore is not competent.

A. To the extent of being a stockholder they are, but to my mind it is immaterial who owns the stock, what is material in this case is the investment value and the cost of the service, character of the service.

Q. Is there anything else charged up to the consumer in
1736 addition to this $10,000 to represent the value of the investment by reason and on account of the protectorate that has been established in this case?

A. I know of no additional charge.

Q. In other words in reaching the value of the investment December 31, 1910, did you add to that value anything for and on account of the fact that the United Gas Improvement Company is back of the investment and will protect it?

A. No, sir; I added nothing to my valuation because of that fact.

Q. And yet with this corporation back of it, as a holding company you still think that the investor in addition to all these other items is entitled to 8 per cent?

A. I think the investor is regardless of who he may happen to be.

Q. You told them in Chicago did you that they were entitled to 8 per cent down there?

A. In what case?

Q. In this People's Gas Light and Coke Company.

A. I did not.

Q. Did you fix 8 per cent down there?

A. No, sir.

Q. How much did you fix as reasonable return there?

Q. 7 per cent.

Q. You raised one out in Des Moines?

A. Yes, sir. My idea of the reasonable rate in Des Moines in this case is 8 per cent.

Q. Did you ever have any experience in Des Moines in investments?

A. No, sir.

Q. Ever talk with anyone who has?

A. No I never talked with any local man about investments?

Q. Have you studied investment conditions in Iowa to
1737 any extent?

A. I have made a study of financial and investment problems in the United States for the last seven or eight years.

Q. Well in Iowa.

A. Iowa is a part of that yes.

Q. Of course Iowa is a part of the United States, but what I am getting at is if you have studied any financial conditions referring specially to Iowa. .

A. Not expecially to Iowa, as a geographic district but as an area of the United States I have as part of the area.

Q. Now in making up this report somewhere I believe I notice that you had tabulated the rates which this company had charged and received for selling gas in Des Moines.

A. Yes, sir.

Q. Can you tell me where that is?

A. I cannot from this copy because this is not paged but it is in this report somewhere. On page 33.

Q. Now Mr. Hagenah just what was your purpose in making reference to the ordinance rates for the years 1896 down to 1910?

A. Just as a part of the historical review of the plant.

Q. Now did that enter into your computation as to the value of the investment and those early losses which you were recouping?

A. It does of course since the gross earnings for these years are used. The gross earnings upon that page each year and the operating expenses each year.

Q. Why didn't you put in what rates were charged by the company during its existence?

A. I don't know what the early rates are.

Q. Did you try to find out?

A. I did. I inquired what they had been and got this particular statement.

1738 Q. Did you regard the rates in force prior to 1896 as important in analyzing the question of value of investment?

A. It is taken into consideration in this total automatically.

Q. You haven't answered the question.

A. They are important because the gross earnings for each year is computed on the basis of the rate charged that year on the amount sold.

Q. My question is why you didn't go back to ascertain how much the company had been charging for gas sold in the city of Des Moines from the time of the installation of the plant.

A. I didn't have any figures submitted to me for the earlier period and this is in here merely as part of the history, does not affect the table at all.

Q. The fact is in 1896 was the time when the first reduction in

rates went into effect in Des Moines, that is your understanding isn't it?

A. I really don't know.

Q. That is to say the company from 1896 January 1st, down to December 31, 1910, they had an ordinance prescribing the rates which are set forth on page 33 of this report. Is that your understanding?

A. I understand that there is some contract under which rates have been automatically reduced here. I have no information as to what rates were in Des Moines except the rate in effect of $1.00 and ten cents gross. I requested the company to give me some information on that and this is what was submitted to me, that is a copy of it. I didn't ask for any earlier because I didn't attach any significance.

Q. Suppose in 1887 the rate was $2.50 a thousand would that make any difference?

1739 A. It would not make any difference in my report because the gross earnings in that report already recognize that.

Mr. GUERNSEY: In the preceding paragraphs you refer to a $1.80 rate. Evidently you had a different rate?

A. That might be, this report was prepared in March and I have forgotten if there is any statement here.

Mr. GUERNSEY: Mr. Brennan said he did not object to me calling the attention of the witness to it because it is evidently an oversight.

COURT: My understanding of it is that at the beginning of his ordinance it was $1.50 wasn't it?

Mr. BRENNAN: Yes, and then before that the rates had been up as high as almost $3.00 at one time if I remember it. There were different rates enforced by the Capital City Gas Light Company covering a period of years from the installation of the plant down to 1896 when this first ordinance fixing rates within the city of Des Moines went into force and effect.

Q. Now what I wanted to know Mr. Hagenah was if you depended entirely in getting your results upon the gross revenues of the company why you set out on page 33 the rates which were in force in the city of Des Moines for the company covering the years 1896 to and including the year 1910.

A. As purely a part of the discussion of the history of the Des Moines Gas Company. The going value table which you refer to is built upon the gross earnings shown by the books for each year.

Q. But don't it form a part of this scheme which you attempt to outline or method for the purpose of recouping the investor on account of early losses and in this same connection do you not take up and discuss the proposition that the rates prior to 1896

1740 were fluctuated more or less and were the subject of change and matters of that kind. Don't you dwell at some length on that proposition?

A. I believe I state in this report, though I don't recall exactly what you refer to that there has been a very decided but gradual

reduction of the price of gas in Des Moines. As part of the history of treating the gas rate question.

Q. You knew did you not that prior to the year 1896 that the gas company fixed its own price of gas?

A. I had no knowledge one way or the other on that, total stranger to it.

Q. Well would you consider that as important?

A. No, sir.

Q. Did you consider the question in making up this report that the company had been the subject of regulation by the city or the state?

A. Did I consider it?

Q. Yes, did you consider that as important?

A. Only as affecting what is a reasonable rate of return.

Q. Then you did consider it?

A. That the company is not subject to regulation by commission, I took that into consideration.

Q. Did you take that into consideration in this report that this company prior to 1896 had not been regulated by the city?

A. No, sir; that in nowise affects my figures in the report.

Q. In arriving at this 8 per cent return you said something about taking into account hazard incident to the investment?

A. I did not say hazard, but I did take hazards into consideration.

Q. Is that one of them?

A. Hazards of the business, one of the elements.

1741 Q. The so called hazard as you term it growing out of the right of the city or state to regulate?

A. When I said hazard I had in mind hazards of a commercial sense.

Q. What I want to know is what importance if any you attached to the fact that the company was subject to regulation by the state or the city in reference to the charges and prices which it should put into force?

A. I did take it into consideration.

Q. Now tell the Master just how you took it into consideration, how you applied it in making up this report?

A. I took it into consideration only in connection with arriving at what I considered to be the fair rate of return. I believe that a utility which is subjected to the uncertainties of a more or less inconsistent policy of regulation under municipalities no matter how honest and well directed the effort may be is such as to lead a company to expect a somewhat higher rate of return than where it is subjected to the consistent regulatory policy of a permanent commission.

Q. Now just how much did you allow to cover that hazard.

A. I could not put it in a mathematical term.

Q. You allowed 8 per cent in all as a reasonable return. Now how much in your judgment represents so called hazard due to the fact of such regulation?

A. I would not put in a mathematical term, I could not say so

much to reduce it to a certain fraction. It is an element which I take into consideration in arriving at this conclusion.

Q. Do you make any distinction between municipal corporation or a state commission exercising powers?

A. I do. I think utilities subject to the regulation of a state commission are receiving benefits——

1742 Q. I am not asking your reasons, simply want to known if you do make any distinction or difference.

A. I do.

Q. Now you spoke of this Antigo Water case. Will you tell the Master how much was allowed in that case as going value?

A. I have not a copy of the decision with me here and I really don't remember the details of that although I worked in connection with the case.

Q. Now don't you know there was not anything allowed in that case?

A. I don't take the position as to whether what you say is true or not, I have not the case well enough in mind.

Q. Did not the utility commission of the state of Wisconsin after going through the history of the Antigo Water Company and considering rates it had charged during the period of its life, find that the consumers had paid for these early losses in the excessive charges that were made for the services rendered.

A. I do not recall the case well enough to express any opinion other than that the commission in its analysis undoubtedly took these elements under consideration and if they allow going value had a reason for doing it and if they did not they had a reason for it.

Q. Is not the fundamental idea in the method pursued by the Wisconsin commission in rate cases where going value is brought into question they take into account the early charges made by the company and the amount of receipts therefrom and if they find that the consumer during these early years has been paying an excessive rate that that recoups the investor for these early losses, don't they consider that and isn't that one of the fundamental ideas.

A. No, sir.

1743 Q. Now what do they do in that connection if you know?

A. The specific rate paid by subscribers in early years is a matter of interest and may be considered, but you must consider the reasonableness of the rate not in view of conditions today and present prices, but in view of those prices and operating costs at the time that rate prevailed.

Q. Take this report of your-, Mr. Hagenah and assuming that you are correct, that it don't make any difference what the rate was that they received, that your theory works out just the same upon the gross earnings. Suppose that the company here in Des Moines charging say the first five years of the operation of the plant $5.00 per thousand cubic feet of gas sold and the consumers have been paying it. Would that make any difference in your computation in arriving at what the value of the investment was say in the year 1890 and assumed that was at the end of five years, 1885 to 1890 had been charging $5.00 per thousand cubic feet of gas sold?

A. Will you add to that anything for what operating expenses were at that time?

Q. Well I am assuming operating expenses as you have shown them here for the purposes of the question.

A. Well if they had received $5.00 per thousand on all their business the rate at that time would have yielded sufficient revenue to wipe out a part of the going value.

Q. Now have you in your report considered the rates which were in force say prior to 1896 for the purpose of ascertaining whether or not the rates which were in force did offset it?

A. I did, my tables built on that theory gives me the gross earnings which I deduct each year, represents the rate charged that year whatever it may have been, even as much as you say multi-
1744 plied by the sales which were made under that rate.

Q. You take the gross income from the year 1887 and are you able to tell from that amount just what the company was charging per thousand cubic feet?

A. No, sir. I don't know but if they were charging $3.00 per thousand it is operating to reduce this element of value which increases to this figure at the bottom of the column.

Q. The fact that the company was charging and receiving without objection $3.00 per thousand feet of gas, now at the end of 1887 when you come to the fixing of value on this investment is that predicated in any sense upon the rate which is being charged?

A. Through the gross earnings being based upon the rate charged that year. It is not necessary for me to get the rate contained in the gross amount.

Q. Assume that at that point the court or some tribunal having authority decided that rate was too high, that $1.50 was all that the company should have charged and received for that service would that make any difference in the value of your investment on the first of January?

A. It would not.

Q. Why not.

A. Because finance does not always weigh the opinion of the court and——

Q. We are assuming that the court is right in its conclusion that $1.50 is a reasonable rate for the service rendered.

A. It does not necessarily follow do I understand it if $1.50 is found unreasonable now it has been unreasonable for any length of time before.

Q. What I want to know is this, assume that the gross earnings, the gross receipts shown as in this report are predicated on a
1745 rate of $3.00 per thousand cubic feet of gas. That in truth and in fact $1.50 is all that service is worth so that your gross earnings are that much in excess of what they should be. Now when you come to ascertain the value of the investment at the end of the year will the rate which was charged by the company make any difference?

A. Yes, under the case that you give it will automatically reduce this element of value because——

Q. Now what would be the value of the investment assuming that the rate should have been $1.50 instead of $3.00?

A. If the rate should have been $1.50 instead of $3.00 then to determine the reasonableness of that $1.50 you would have to make an analysis of the operating expenses including depreciation. You would find out then under the $3.00 rate so much to gross earnings and may have added so much that there would have been absolutely no deficit that year but showed a surplus which under this table would automatically apply to wipe out subsequent deficits is there were any. Now if the table was pursued right straight through on that basis we could arrive on the valuation in this case on your assumption say in a figure considerably less than the present physical value of the property.

Q. I understand you have no records, none furnished you and that you have no information with respect to the amount of the gross revenues of the company or the depreciation of the same for the years prior to 1886?

A. No, sir; I have no information prior to that.

Q. So in making up your estimates of the value of the investment of course you have not taken anything into account, the conditions into account preceding the year 1886?

A. No sir.

1746 Q. Now if it should appear that during the history of the plant, its operation up to the year 1887 that the company had earned more than that to which it was entitled under the law would that change your figures in this report?

A. Yes, I would take my table back beginning with the first year for which I had information and carry it forward from that year instead 1886. If then the company had had a large surplus at the end of each of these years it would show to lower the figure here. The surplus each year being dividends earned by the rate charged or by the difference between the operating expenses at that time and the rate at that time and the gross earnings at that rate.

Q. Isn't that in effect the theory pursued by the Wisconsin rate commission in rate cases in computing this so called going value, value of investment, going concern value or whatever you may term it? Isn't that the method pursued. In other words if the consumers during early years of operations of the plant have paid in these excessive charges that then there can be no such thing as going value in a rate case?

A. No, sir; that is not so.

Q. And isn't that the logic and conclusion of this commission in the Antigo Water case?

A. It is not.

Q. You say it is not?

A. No, sir. Based on the question as you put it because you do not consider in connection with excessive rate in years gone by the excessive operating expenses making it necessary to charge that excessive rate. There have been companies charging as high a rate as $1.50, $1.75, and $2.00 that have been forced into the hands of receivers whereas companies charging 85 cents, prosper.

1747 Q. You don't know of any gas company in Des Moines having been forced in the hands of a receiver?

A. No, sir.

Q. Do you know when it was the state of Iowa first undertook to regulate prices or charges of gas companies?

A. No, sir; I do not.

Q. Do you know that it is a fact that not until 1892 or '93 that any attempt was made on the part of the state of Iowa or municipalities to regulate the prices or charges for gas in the city of Des Moines?

A. No, sir; I have no knowledge on the subject.

Q. Would the fact that this was but the second attempt in the history of the gas business in the city of Des Moines to regulate rates, would that have anything to do with the hazard you consider in connection with the rate of return?

A. No, sir.

Q. The mere fact the right exists you think ought to be charged up to the consumer a-though never exercised?

A. It is not so much the extent to which you carry that exercise at any particular time as the danger that you may exercise it at any time.

Q. The fact it is there you think is a menace to the investor?

A. Yes, sir.

Q. That it may be exercised at any time and therefore the investor is entitled to a larger return.

A. Yes, sir. If I may add I think that a contract for a number of years say four or five years would justify a somewhat lower rate of return than where the rate question or reasonableness of the rate may be exercised at any time and as often as the coun- de-

1748 sires.

Q. Now the difference between the $1,928,016 and the amount which you finally arrive at as representing the value of the investment, the difference between those figures represent what?

A. What I would call the accumulated losses.

Q. Is there any difference between these accumulated losses and socalled overhead charges?

A. Yes, sir.

Q. What is the difference, where is the difference?

A. What I understand your idea of overhead charges to be that is an addition to the construction of the plant by virtue of its supervision during construction.

Q. You consider that at all in arriving at the value of the investment?

A. I have not in this table except as the items are included in operating expenses. I make no different computation.

Q. It is charged in somewhere along the line?

A. A very small degree of it has crept in.

Q. You do consider engineering charges and contingencies during the period of construction?

A. As I consider them part of the construction charge, but I have not made any addition for that purpose in these values.

Q. It appears somewhere increases the operating expense or some other expense account don't it. In other words, if you would just take the actual cost of operation without regard to these contingencies your operating expense account, would not be as large.

A. Be a difference amount of operating expenses, but charges which should be to capital account and it is automatically taken care of in this table. If the item is not construction work but is
1749 an item of overhead character they have charged there on the books it shows to that extent the reasonable overhead charges.

Q. Do you know of any such case to which you have referred?

A. I have not any in mind. I am merely stating how that would come. I know during construction of a building they are not charged on the books with what might be reasonable overhead charge what would be regarded as reasonable.

Q. That is an assumption on your part?

A. An assumption based upon an analysis shown by the facts established on the company's books.

COURT: You take two and a half per cent depreciation would give forty years' life on the plant.

A. I think that is a little high, that is the way I worked it, some tables use a lower rate.

COURT: I wish you would answer my question. Two and a half per cent depreciation is forty years' life of the plant?

A. Approximately.

COURT: And two and three quarters, how do you figure that, thirty seven and something?

A. I have not the engineering data.

COURT: I want simply some idea on what you based it?

A. It is about that much.

COURT: Two per cent would be fifty years?

A. Yes, but in arriving at the two per cent I allow the sinking fund method which amounts to a life of not fifty but would be probably around thirty four years.

COURT: Have you calculated compound interest on this money set aside?

A. No, sir; I have not worked out any formula on that.

1750 Mr. BRENNAN: Could you by tomorrow morning without too much trouble give us the sales by number of thousand cubic feet of gas in the years you considered in connection with this report. If you can do that without too much trouble, we would like to have it.

A. I don't know where that data is just now but I will make an effort to get it for you.

Here the further hearing was adjourned until 9:30 o'clock tomorrow.

1751 AUGUST 5, 1911, 9:30 a. m.

Counsel for respective parties all present.

At this time, 9:30 A. M., at the request of counsel for defendants, an adjournment was taken until 9:30 A. M. August 7th, 1911.

MONDAY, AUGUST 7TH, 1911, 9:30 a. m.

Counsel for respective parties all present.

At this time, 9:30 A. M., at the request of counsel for defendants, an adjournment was taken until 2 P. M. of this day.

1752 TWO O'CLOCK P. M., MONDAY, *August* 7, 1911.

W. J. HAGENAH being continued on cross examination by R. O. Brennan, Esq., testified as follows:

Q. Mr. Hagenah, I got the understanding from something you said on your examination in chief that you inclined towards the cost price of the property in arriving at its appraisement for valuation rather than at the duplication method?

A. I use one method to supplement the other. I would always ascertain if possible the cost in connection with the appraisal of the property for rate making purposes.

Q. And where you have the data and records from which you can ascertain the cost price of the property then you regard that as the most satisfactory do you not in making an appraisement or valuation of the property?

A. Not without making some analysis and adjustments beyond that point.

Q. And where you have the data and records to which I call your attention you would not go out in the realm of reproduction to the extent that you might do if the records and data were not available would you?

A. Yes, I would still make an appraisal but I would not be guided by either without supplementing or checking my figures with the other.

Q. Now at page 44 of Exhibit 23, which is the page following immediately the table showing annual investment on the 8 per cent earning basis—you were addressing this report to the Des Moines Gas Company were you not?

A. Yes, sir.

1753 Q. I call your attention now to page 44 commencing at the 5th line, your records are complete and admit of detailed analysis. You were referring to the records of the Des Moines Gas Co. in that statement were you not?

A. Yes, sir; the construction account.

Q. And the pronoun "your" had reference to the Des Moines Gas Co.?

A. To the company yes.

Q. It is believed that where the records covering early transactions are available the investment value should be determined in this manner rather than to base it upon the experience of some other plant

in some other city under entirely different conditions. When the early records are not available such investment must be determined from other sources more particularly on the cost of reproduction basis. This method was not necessary here so that the tables show actual cost and investments in Des Moines unaffected by conditions making for higher or lower values in other cities. When you made your report to the Des Moines Gas Co. in reference to your investigations you meant just what you have stated here did you not?

A. Yes, sir. That in arriving at the investment value of the property for rate making purposes I would analyze the construction cost and to arrive then at the final amount upon which the rate of return should apply I would use that construction record analyzed as I have shown in this report to determine my final value whoch includes the accumulative losses during the period of development.

Q. Well you followed that method throughout your report did you not?

A. In this report?

Q. Yes.

1754 A. Yes, there are no reproduction costs in this report.

Q. Therefore it is your idea is it not, Mr. Hagenah that where you have the records of the company such as you have in this case that you regard it as the most satisfactory way of arriving at the value of the investment rather than to produce that value or attempt to produce it on the reproduction theory?

A. I would not put it as strong as that.

Q. Well how strongly would you put it?

A. To explain my position I would have to go into more detail. The book figures show the prices which the company paid for the property at the time that it made the purchase. Land has appreciated under ordinary conditions since its purchase. We know the commodity prices have advanced materially. We know that labor prices have advanced. We find certain items after making an analysis are not always, and in this particular instance do not appear to have been charged to the construction account. Therefore even if the construction account admits of the most detailed analysis it would not in this case give the full value of the property or cost of the property rather upon which the rate of return should apply without making additional analysis.

Q. In other words you consider the changed conditions in the prices of labor or in the prices of materials since the items were placed upon the books representing the cost at that time.

A. Yes, sir.

Q. Now then if you found upon analysis and upon investigation that the prices shown by the records of the company were in excess of prevailing conditions at the time of the investigation would you make the credit in favor of the public?

A. Yes, that is the reason why a reproduction value of the property should be ascertained to use as a supplement to the cost of

1755 production.

Q. Well is that the entire property or just these items

which are affected by the conditions at the time of the investigation?

A. That would mean to separate the particular items where there has been a material enhancement or reduction in cost that would be satisfactory, but it cannot always be done so the proper way in my estimating of arriving at the valuation is that where your costs admit of a careful analysis to make that detailed statement and then to make an appraisal of the property on the reproduction basis less depreciation giving you present value and to place them side by side and from that information to exercise a reasonable and fair judgment as to what would be proper and fair to the public and fair to the investor.

Q. And that judgment is based primarily upon the conditions which you find on the books representing investment made by the stockholders?

A. One of the elements, but nor primarily.

Q. Isn't it the principal element which fixes your judgment in determining the value of the investment, the method you have pursued in this case your standpoint?

A. No, sir; I have sufficient specific instances in mind to guard me against doing that in my work.

Q. So far as this report is concerned you have not adopted the reproduction method?

A. No, sir; because I have no engineering estimates in this report to give present values.

Q. Your reason for that is explained on page 44 of Exhibit 23 is it not?

A. What line do you refer to?

Q. The matter to which I call your attention that occurs on page 44 where you state to the company the fact that the records
1756 were in such shape you were able to make an analysis of them from the records and from the records ascertain the value of the investment?

A. The quotation from the report to which you refer shows my analysis from the construction account here in the absence of any engineering data.

Q. I see you explain also do you not in that page 44, that it is not necessary to adopt any other method on account of the books and records being substantially complete?

A. It is not necessary if the logic of this report is carried through entirely. If, however, you were to put merely the construction cost of labor and material without carrying the analysis farther into the account of losses, then of course the analysis of the books alone would not give you proper value?

Q. I understand that, but what I mean to say is, you have told the Des Moines Gas Co. the method by which you arrived at your valuation of the investment and that you did not deem it necessary in view of the fact that its books and records were in the condition that you found them to indulge in the reproduction method or

theory in arriving at that valuation and that you have fully explained in page 44 of this report.

A. Because I had access to sufficient detailed information I was enabled to work out the actual cost and losses during this period of twenty odd years to give them what I considered the investment value today?

Q. I assume that in this report you have endeavored to include what the other engineers have termed going value have you not?

A. Not the same going value as defined by them.

Q. No, but it works out on the same theory, it is an intangible value is it not which you consider in connection with your

1757 appraisement?

A. I would hardly call it an intangible value, I call it the losses which the company could not avoid in operating its business and upon which it should therefore be entitled to a reasonable rate of return until the surplus profits wiped out these early losses?

Q. In other words you capitalize the early losses of the company do you not, by your process?

A. In these tables.

Q. Yes, that is what I mean. And why do you do that, what purpose do you have in capitalizing the early losses?

A. Because I believe the investor has not received that reasonable rate of return to which he is entitled in law and in business unless he is reimbursed for his losses. If that adjustment is not given, if he is not allowed to add to his investment the unavoidable losses, that amount which he may receive reasonable rate of return upon, what we call investment exclusive of these items it will not, as a matter of fact be the same rate of reasonable return upon his actual investment.

Q. The thought I am trying to bring out is whether that is the equivalent of the going value theory which has been advanced by Mr. Baehr and Mr. Lea?

A. I don't understand it so. There are logical differences.

Q. So you in this report do not treat of the subject of going value at all, is that correct?

A. The term going value has so many different definitions it is almost impossible to get two or three different people to mean the same thing when speaking of it that way. I would rather call it investment value.

1758 Q. Do you regard it as equivalent to the going value theory that has been advanced, that is in its final analysis and final results?

A. I would not want to say that the company was entitled to any going value over and above the allowance I make it here, yet I would not exactly say that this is the same element which they are trying to arrive at.

Q. Well is it the same method by which you reach a conclusion as to the value of the property of the People's Gas Light & Coke Co. at Chicago?

A. The same process of reasoning, yes.

Q. You treated it in your report to the sub-committee of the city council of Chicago as going value did you not, or at least took up the subject of going value and attempted to discuss it in your report.

A. I did take up the subject of going value and treated it at considerable length where in I made the statement that the term was so indefinite that very few people had the same conception of the meaning ordinarily conveyed by the term. I called it some broader term and in connection with my analysis referred to several methods of arriving at going value. This really approximates it although I would not say it is the going value.

Q. In other words what you intended to point out in that report was that you had reached the value of the property along the lines as you have stated in this case.

A. Yes, sir.

Q. And that you were saying to the committee of the city council in said report that this included that going value item.

A. Yes, I think this is the best and fairest way to both parties concerned in arriving at that more or less intangible and
1759 indefinite item which has up to this time been called going value or franchise value as some people call it, that also enters in this element under discussion.

Q. You of course did not undertake to define what going value is?

A. I attempted to define it in the gas report of which you have a copy.

Q. Have you a copy of your report?

A. Yes, sir.

Q. That you made to the gas sub-committee and submitted to the — of the city council of the City of Chicago.

A. I have.

Q. Now at page 44 of that report you use this language do you not? "The term 'going value' has never been defined by the courts or students of public service problems in a manner to meet with general acceptance. Its existence however, has been recognized by all the courts and public service commissions and it must be allowed in computing the amount of the investment. Whether such value exists as an incident of the physical plant, whether it is entirely independent of the physical value and to be determined from other sources of information, as, for example, the number of customers or the gross earnings, or whether such value may deserve no consideration as an addition to the physical plant, depends largely upon the definition adopted."

A. Yes, sir; that is the correct quotation from the report.

Q. Well now just how do you define it in this case, so that we may apply your reasoning to the testimony, I mean the case we are now trying, the instant case?

A. If you will pardon me just a moment I think I have my definition in the report somewhere, I don't know just what page it
1760 is on. I think I can find that definition quicker if I may refer to another paper.

Q. Refer to any record you may have.

A. I will quote here from an article which I wrote and in which I say that going value exists by virtue of a public utility being a live operative unit actually producing revenue and supplying service to its customers who have been induced to subscribe thus giving to the company its established income, in the development of which large expenditures have been made in one form or anot-er leading to the probable postponement of interests and dividend returns to the stockholders.

Q. That was the definition that you applied in the Chicago case was it, Mr. Hagenah?

A. That is the definition I have always had in mind and I must have considered it such at that time and I have defined it in this report although I cannot turn to the exact paragraph now.

Q. Now in placing a valuation upon the property of the People's Gas Light & Coke Co., was your going value predicated upon the thought of early losses sustained by the company in the conduct of its business or was it based on the thought that the company induced or had expended money in securing their franchises and relieving themselves of competition?

A. I endeavored to place my going value as I have defined it upon the facts as shown from the analysis of the various records which the officials of the People's Gas Light & Coke Company submitted to me in the quest for that. I desired to ascertain the losses which the company had sustained in the conduct of its business and endeavored and believe I succeeded in eliminating from my allowance for going value every element of franchise value.

1761 Q. But you did in your report to the sub-committee recommend an allowance approximately of ten millions did you not to cover the item of going value.

A. That is approximately the amo-nt that my tables sho-ed for the calendar year, 1909.

Q. And just what did that ten millions represent?

A. The losses as I analyzed them from this examination of the company's records through the period since 1897 when the consolidation took effect in that city.

Q. Were those losses that were incident to the conduct of the business in operating its gas works and in manufacturing and distributing gas in the city of Chicago, or was it to reimburse the company for the expenditures made by it in buying franchises or getting rid of competition?

A. To reimburse them for the element of loss and for expenditures which they could not avoid because of the policy which existed at that time and again I say that I placed no value upon the element of franchise.

Q. And didn't you put it on the basis of a penalty against the people of the city of Chicago from the fact that they had through the council granted franchises from time to time to other companies and thereby had created sharp competition and on account of the acts and conduct of the citizens of Chicago as declared by the city council that they should pay for the trouble that they had caused

the People's Gas Light & Coke Co. Wasn't that the sum and substance of the theory upon which you recommended this $10,000,000 as part of your valuation?

A. No, sir; not in the way in which you state it.

Q. Well now in what way did you state it in that respect?

A. I have stated it in a very detailed form in this report
1762 which covers a good many pages of analysis of that very item all of which is based upon the company's detailed costs and represent as I said an allowance for losses in business and the property which the company purchased in the form of expenditures which could not be avoided but no allowance for franchise value.

Q. Have you your typewritten report or a copy of it among your papers?

A. Which report?

Q. That you made to this sub committee of the council of the city of Chicago?

A. No, sir.

COURT: I want to ask a few questions. You found the book value of this concern on the 30 h day of June 1887 tp be $308,983?

A. Yes, sir; that includes the working capital on that date.

COURT: Now you add to that 8 per cent interest for one year.

A. Yes, sir.

COURT: And then you added to that the additions to the plant which amount to $18,394.

A. Yes, sir.

COURT: Then you added to that interest on the additions to the plant for six months at 8 per cent interest?

A. Yes, sir.

COURT: And then you also added to that the operating expenses, the entire operating expenses of the year?

A. Yes, sir.

COURT: Then you added one fortieth of the capital at the beginning of the year June 30th, 1887 for depreciation?

A. Yes, sir. This is not on the total property, but on the depreciable property. Not that amount but a smaller amount.
1763 That includes land and working capital which is not depreciable.

COURT: That total made $412,082?

A. Yes, sir.

COURT: Then you took from that the gross income?

A. Yes, sir.

COURT: That left you $333,289?

A. Yes, sir.

COURT: You took that for your original capital then at the beginning of that year?

A. Yes, sir.

COURT: This amount was contained in the treasury $7,497?

A. Not necessarily in the -reasury for any length of time.

COURT: Did you find it there at the end of the year, they had not expended it had they?

A. The amounts charged for replacement would not be charged

in the operating expenses. This is the amount which represents the depreciation during the year. They may not have replaced any property to represent that accrued depreciation, in that event you are correct in saying it will be in the treasury. If they did actually replace what is represented by accrued depreciation during the year they might have wiped that out so there would be none of it in the treasury.

COURT: But it would be depreciation made good?

A. It would in that event, yes sir.

COURT: That is included now each year isn't it in getting at these totals?

A. Yes, sir.

COURT: Did you ever calculate to know how much that would amount to at 8 per cent interest?

A. They include it this way so as to insure your plant in
1764 first class condition at the end of each year.

COURT: It would be in first class condition at the end of 24 years?

A. If you allow that amount for investment value.

COURT: This is figured at 8 per cent all the way through here, whether used or not used?

A. Yes, sir. They may use more than that amount some year and have to borrow.

COURT: To make good the depreciation?

A. Yes, sir.

COURT: I notice here in red $588.20 and then in the totals that red is taken out, how does that come?

A. You mean my figures are in red. They were credits on construction account that year, the property was reduced in value on the books? That amount on the construction account was taken out.

COURT: That is true also in the street lamp extension?

A. Yes, sir.

COURT: Also in the meter account?

A. Yes, sir.

COURT: If I understand you correctly the amount of money expended after deducting all these by the company taking its book value, $295,383.08, was that its book value at that time?

A. At the end of 1887, yes. I added to that the working capital.

COURT: This is minus working capital?

A. Yes. The amount total in the last column, $298,383.08 is the total amount of money invested in the plant on the 30th day of June, 1886 according to the books less the working capitale, the total value of the plant or property.

COURT: The total value of the property?

1765 A. That is the total value of the property.

COURT: In other words that is the total amount of capital invested at that time less the working capital?

A. Yes, sir.

COURT: You have ascertained that each year here?

A. Yes, sir.

COURT: And you find at the close of the first day of January there was $1,928,016.65 actually invested by the company according to the books?

A. Yes, sir.

COURT: Is that correct.

A. Yes, sir.

COURT: And you have examined these books carefully?

A. Yes, sir.

COURT: You are satisfied that is correct?

A. Yes, sir.

COURT: There is another thing I don't understand, that is what are your fixed charges I wish you would show me where they are?

A. The fixed charges represent the interest on the company's bonds for the year.

COURT: Also earnings on the preferred stock?

A. No, that is not a fixed charge, that is a dividend. Dividends are not regarded as fixed charges. The directors will not necessarily have to pay the dividend but they will have to pay the interest.

COURT: What I wanted to know in particular is what fixed charges are?

A. It is interest on the bonds.

COURT: And taxes?

A. No, sir.

1766 COURT: Fixed charges is interest on bonds?

A. Yes, sir.

COURT: What do they amount to?

A. The fixed charges for the year 1910 were $80,014.10, there were no dividends.

COURT: Table "B" is $84,493, page 22?

A. That represents the interest on bonds.

COURT: Now what was the interest on bonds?

A. For which year?

COURT: Well for the years given here.

A. The figure you gave is the year 1909. I just gave the figures for 1910, $80,014.10.

COURT: This is on a different year?

A. Yes, sir.

Mr. BRENNAN: I don't want to take up the subject of depreciation at this time, but there is one question in connection with the Master's inquiry I would like to have you state, that is in your table there, I believe you estimated two and three quarters per cent on depreciation?

A. That was my first trial table.

Q. Does the fact that the property is in say a 90 per cent state or condition, — that make any difference in your mind as to the amount of interest, two and a half or two and three quarters you have adopted there?

A. You mean depreciation not interest?

Q. Depreciation, yes.

A. I would not make any such an allowance. I want to be understood as not basing my final allowance on two and three quarters.

Q. And what do you say?

A. Two per cent on depreciable property and I have a
1767 second table at two and a quarter.

Q. By depreciable property I presume you mean all property subject to decay or deterioration?

A. Yes, sir.

Q. But not including real estate?

A. Real estate has been eliminated because that does not depreciate. Working capital is not included in computing this allowance.

Q. Of course current repairs, you don't include that do you as depreciation?

A. No, sir.

Q. Returning to the subject of your report to the sub-committee of the council of the city of Chicago, I want to get thoroughly fixed in my mind if I can your theory of this going value and I am not calling your attention to page 47 of your printed report to that sub-committee in this you use this language: "It is impossible to trace the history of the gas business in Chicago without realizing that the policy pursued has created tremendous losses." Now just what policy was pursued that resulted in these tremendous losses?

A. The unnecessary duplication of plants referred to in the succeeding sentence.

Q. Continuing you say "Plants have been built, streets torn up and the development of a business of established companies greatly hampered, if not partly destroyed, for all of which there was no real occasion. To protect itself in such a situation there was little which an established utility could do except to purchase its rival outright or to enter into an agreement at the earliest possible date before extensive investments were made. This situation in a sense
1768 created prior to 1897 a ready market for franchises and the prices varied with the possibilities of the newer companies, and probably also with the influence of grantees. That this situation with its opportunity for private profit in addition to the desired competition was clearly realized may be assumed from the number of franchises granted and the prices paid therefor. Unfortunately the records of these many transactions are not as complete as they should be in order to make possible the most satisfactory analysis of the intangible values due to the forced investment but there appears to be sufficient data to warrant a belief that some of those who were entrusted with the protection of the public rights and also certain officers of the purchasing companies found in the combinations means for mutual profit. When the public, even with the best intention, has thrown obstacles in the way of development of its utilities leaving them no option except to remove those obstacles at a heavy cost or to engage in a struggle in which the company must inevitably suffer, such burden in law and in common fairness must be regarded as an investment expenditure." Isn't it a fact that these ten millions which you recommended to this committee as representing that investment was predicated entirely upon

the expenditures which you have stated in that report namely the amount which the company paid or which did not go outside of the company.

A. It is not.

Q. Well what else do you have in mind?

A. I tried to explain that at length Friday but I was not permitted to. In the absence of my detailed record I cannot give you all the elements other than to say that I made a thorough analysis of that company's books along the same line of reasoning which I have done in this case, that I found certain elements of
1769 losses in operation, that I found expenditures which the company could not avoid due to this policy, that there were elements which I think it would be extremely unfair to charge against the public all of which I eliminated in those instances and that from the records to which I had access and which my men examined I came to the conclusion that an allowance of ten million dollars should be made to the benefit of the company and that the balance of such losses or expenditures should not be charged against the people of Chicago. In the absence of my record I cannot give you any more detailed statement.

Q. Continuing at the bottom of page 47 you say "Where such expenditure is increased because of private gain, this amount should not be considered as an addition to the investment. The problem in each case is to determine the legitimate expenditure which the existing company could not avoid because of the city's erroneous policy." Now did you determine from the investigations that you made and data which was furnished to you just how much the People's Gas Light & Coke Company or its immediate predecessor had paid to get rid of its competetive rivalry?

A. I made an analysis on that subject, yes.

Q. Do you remember what your figures were on that subject?

A. No, sir.

Q. Well you did find it largely in excess of ten millions did you not?

A. I found the losses and unavoidable expenditures exceeded ten million dollars.

Q. I am speaking now of the amount which was paid for these franchises and to get them out of the way and in retiring these rivals and competitors from the gas field in Chicago?

1770 A. Yes, that amount exceeded ten million dollars.

Q. You did find that while that amount exceeded ten million dollars that you were only able to find that those on the inside had expended ten millions?

A. I don't remember that.

Q. Now did you make a statement before the sub-committee of the city council of the City of Chicago with reference to the report?

A. The sub-committee and the committee on gas, oil and electric light in Chicago never gave me opportunity to explain my report.

Q. Did you make a statement to the committee or any member of the committee at any time in connection with your report or the full committee which was taken down at the time by a stenographer?

A. There was some discussion before the committee but I never was given opportunity to explain my report as I should have been.

Q. On the 6th day of June, 1911, Mr. Hangenah, or about that date, before this committee which you have referred to I will ask you if you made this statement in connection with your report as follows: "It was the cost of the franchises which the company had to purchase in order to maibtain its monopoly rights and losses in developing the business of these different companies that were absorbed in 1897 so far as I could compute it and the extraordinary legal expenses which the company could not avoid in connection with these various contests which they had for a number of years prior to 1897?" Did you make that statement?

A. I don't remember whether that is a correct quotation. The subject was discussed there.

Q. Or that in substance, was that about the substance of what you told the committee?

1771 A. We discussed that subject. I don't remember that particular quotation.

Q. Well you recollect that the subject to which I am calling your attention was the subject of conversation and discussion at that committee meeting?

A. We discussed that subject there yes.

Q. You made the statement to them in reference to the amount which you had allowed and recommended in your report?

A. We had a running argument there in which everybody took more or less of an active part. I don't remember the exact quotation to which you refer.

Q. Well of course you are not prepared — that is not what you said at the time?

A. I would not express any opinion on it.

Q. Did you state to that committee and at that same time or during that meeting that the company had on its books $23,000,000 spent to clear the field of competing companies and which you termed as parasites and that you thought that only 10 millions represents money that went to those outside of the company directly benefited. Did you state to the committee while you were discussing your report and making explanations of its contents that or that in substance to which I have called your attention.

A. I remember discussing the subject but I don't recall any specific remark. I would not want to express an opinion on that without refreshing my memory from my own notes.

Q. Does the amount 23 millions, does that refresh your recollection to the extent that you are able now to say that you did find upon the books of this company which you investigated this 23 million dollars representing this item?

1772 A. If you were more familiar with the situation in Chicago at the time of the consolidation of the People's Gas Light & Coke Co., the present corporation there that remark to which you refer I think would be more easily understood. At that time there was a consolidation under the act of the legislature involving about——

Q. I hardly think that is in the question, but of course I don't care, you may go ahead, proceed if you want to, if that is the only way.

A. I was trying to clear it up. There was a consolidation at that time of about eight or nine more or less competing gas companies and the company's adjusting balance sheet showed an issue of stock of substantially that amount in excess of the property which I found embraced in the consolidation. As to the details of the amount I can express no opinion now in the absence of my record.

Q. As I understand you in the city of Chicago prior to this act which authorized consolidation there were a number of competing companies engaged in supplying and distributing gas?

A. Yes, sir.

Q. And a sharp competition in the city. And the People's Gas Light & Coke company, or its immediate predecessors or one of them spent this twenty three million of dollars from time to time in taking up franchises and reducing competition.

A. I don't know that.

Q. I say that is what the books show which you investigated?

A. No, sir.

Q. That is what you stated the amount which the books showed expended of twenty three million for that purpose?

A. The books showed the issue of stock to the amount substantially of twenty three million dollars in excess of the amount of property which I could determine was turned into the new People's Gas Light & Coke Company and devoted to the public use.

1773

Q. You refer to these rival companies as parasites, don't you remember using that term?

A. Doubtless I called them that, I would consider them tha- now I think so.

Q. And before that committee you stated didn't you in substance that you found or rather you were not able to find that any more than ten million represented money that went to those outside of the company directly benefited.

A. The ten millions represented what I in my judgment felt should be the allowance made in addition to the value of the physical property.

Q. You did allow ten millions, recommended that amount as going value to cover this expenditure, wasn't tha- the sum and substance of your report?

A. I recommended the allowance of ten million dollars in addition to physical value.

Q. To cover these expenditures to which I called attention?

A. To cover expenditures as I analyzed them to the committee.

Q. Do you say you did not make the statements to the committee I have quoted?

A. I do not know. I have not the records here. I don't know whether you are quoting me correctly without the record.

Q. Did you state to that committee that the company, referring now to the People's Gas Light & Coke Company had on its books twenty three millions of lollars spent to clear the field of competing

companies and which you term parasites, but that you found
1774 only ten millions represented money that went to those outside of the company directly benefited. Did you state that to the committee or that in substance?

A. I don't recall *your* exact words. I have stated what I believe was my remark before the committee.

Q. I am not asking your exact words, did you state that or that in substance?

A. I don't remember all the details which you include in that question.

Q. Did you say that is not the substance of the statement which you made to this committee?

A. I don't remember. I understand a record was taken at that time and I have a copy of that somewhere in my records.

Q. Have you got that with you?

A. No, sir; I have not

Q. There was a transcript of the record that was made of the proceedings of this committee was there not?

A. I believe so.

Q. You say you have a copy of that?

A. Not with me. A copy was furnished me. Not of the entire proceedings because I didn't stay with the city during the proceedings on the gas question.

Q. You had a copy of what took place, what was said during the time you were present before the committee.

A. Not all of it. I was not furnished a copy of the proceedings which I participated in the last two days I was with the city of Chicago.

Q. What did you mean by the language I have quoted there and to which I called your attention?

A. I don't know that that was my language.

1775 Q. Now I will call your attention to page 47 of this report, your printed report where you use this language "When the public, even with the best intention, has thrown obstacles in the way of development of its utilities, leaving them no option except to remove those obstacles at a heavy cost or to engage in a struggle in which the company must inevitably suffer, such burden in law and in common fairness must be regarded as an investment expenditure." What did you mean by that?

A. That represents my honest view.

Q. What is your honest view?

A. That this statement as just given which expresses my view. I made an examination of the company's books in connection with that.

Q. What expenditure did you have in mind, what was it?

A. Expenditures which the company at that time could not avoid because of the property which it was compelled to assume in the exercise of its public service monopoly.

Q. You use the language here investment expenditure, now just what was that expenditure which you had in mind?

A. The term investment expenditure is not singular at all. I am merely referring to a class.

Q. Now what did you have in mind, what expenditure?

A. Legitimate construction items as I have analyzed them from the company's records.

Q. The total of the other items you were considering and then this particular item of going value which you recommended should be allowed by the city council of the city of Chicago in favor of that company to the extent of ten million dollars. I want to ask you what you had in mind when you said to that committee in your report that when the public even with the best intention has
1776 thrown obstacles in the way of development of its utilities, leaving them no option except to remove those obstacles at a heavy cost or to engage in a struggle in which the company must inevitably suffer, such burden in law and in common fairness must be regarded as an investment expenditure.

A. Will you permit me to give you an example?

Q. I would like to have an answer to the question as to what that referred to?

A. Referred to my analysis of the company's books and the conclusion which I drew from it.

Q. You concluded didn't you that the company had as you stated, was compelled to go out and retire these rivals from the field.

A. They did retire quite a number of them.

Q. And that you were able to trace a credit to the company of about ten millions, but the rest of it you could not tell who got the benefit of it?

A. That was substantially the result of my analysis of the equities at that time.

Q. You recommended to the city council at that time it was to the amount or extent of ten million? The going value.

A. I don't know as going value was the proper term, I allowed them as an element of value in addition to the physical property.

Q. You had going value in mind didn't you?

A. I discussed that under the subject of intangible property.

Q. And in this report you undertook to define going value and point out to the committee or sub-committee of the city council what it really was and what it represented?

A. I did discuss it at considerable length in this report.

COURT: Do the books carry a replacement account?

A. At the present time, no sir.

1777 COURT: Did you eliminate any items on account of replacement in this schedule?

A. Construction account, yes, which had been renewals charged into operating expenses.

COURT: To what extent?

A. I find in the year 1910 substantially $7,351.92 improperly charged to operating expenses.

COURT: That was for replacement?

A. Replacement, means that should have been charged to investment.

COURT: Where is that shown on the report?
A. Schedule 5, the one you last referred to?
COURT: How much is set over to operating expenses in the year 1908?
A. $135.07.
COURT: That is shown on schedule 5 of your report?
A. It is yes, sir.
COURT: For the year 1909?
A. $1,957.34.
Q. Where do you find that?
A. In schedule 5, of my report.
COURT: The third column?
A. Yes, sir.
COURT: For the year 1910?
A. $7,351.92.
COURT: That includes the entire year does it?
A. Yes, sir.
COURT: And from September 30th up to January 1st also of 1909, also from September 30th, 1909, to January 1st, 1910?
A. Yes, these expenditures occurred in that overlapping period.
COURT: They really occurred in 1910?
A. Yes, sir.
1778 COURT: And occurred between September 30th 1910 and December 31st, 1910?
A. No, sir; was made in the twelve months' period.
COURT: And that occurred between September 30th, 1910, and January 1st, 1910?
A. Yes, sir.
Mr. BRENNAN: Now I want to direct your attention to the balance sheet under date of March 1, 1906, at page four of your report, Exhibit 23. There you show the investment December 31, 1910, as per the company's books $3,853,975.22. Do you know what the balance sheet was say in the year 1905?
A. I have not a copy of it no sir.
Q. In making up this report did you examine the balance sheet for that year?
A. I did.
Q. Do you remember what it showed?
A. No, sir; I do not.
Q. In February 1906, is when the transfer was made was it not from the Capital City Gas Light Company to the Des Moines Gas Co.?
A. Yes, from February 28th to March first. The Des Moines Gas Company dates from March 1, 1906.
Q. Have you anything there, any memorandum showing the assets or book value of the property of the Capital City Gas Light company on that date?
A. No, sir; I have not. I analyzed that though.
Q. Can you tell the Master approximately what it was?
A. I can't give any figures except to say that the plant account of the Capital City Gas Company the last day of its existence showed

a plant investment considerably less than the items now shown on the balance sheet of the Des Moines Company.

1779 Q. Didn't it show there a book value of about $1,605,475.10?

A. I don't remember the figures. I took the construction account from 1886 and traced the charges and credits for that account down to the end of the calendar year, 1910, and wherever I found a charge to the construction account which I thought was not a proper charge to be included in the basis of investment for a case of this kind, I eliminated it so it showed a physical value of $1,928,000 roughly against its value of $3,853,000.

Q. You did examine the balance sheer for the year 1905 didn't you on the company's books?

A. I saw it. I analyzed not the balance sheet but the construction account in the balance sheet.

Q. Against that amount to which I have called your attention do you know what the liabilities were?

A. I don't recollect. I paid no attention to the amount of stocks and bonds which the company issued every year other than to include it in the final balance sheet and disregard it as an element covering value in estimating its valuation.

Q. Have you any record or memoranda under your control at this time from which you can tell the Master what the book value of the property was at the end of the year 1905?

A. No, sir: I have not.

COURT: The Des Moines Gas Company took charge of this in 1906.

A. March 1, 1906.

COURT: These totals represent the total.

A. These represent the additions for each year, this is the total at the end of the year.

COURT: You mean by that that the totals at the right hand side of the table represent the extensions do they?

1780 A. Yes, sir.

Q. For each year?

A. Yes, sir.

Q. These extensions for the year commencing February 29, 1907, and December 31, 1910, the sum total of those preceding that would make the amount?

A. It would not give the book figure, but give what I consider the fair figure, the book figure would be more than that, because I eliminate items that I thought were not proper.

COURT: This would give the book figure?

A. It would give a figure I considered fair at that time.

Q. On this schedule 1 of Exhibit A, at the opening of the balance sheet March 1, 1906, you have listed under assets property purchased $3,592,723.24. Now will you say to the Master, that the balance sheet at the close of business of the Capital City Gas Light Company showed property of a book value of that amount?

A. It does not. It shows property of a valuation less than this amount.

Q. How much?

A. I don't recall the exact figure, but quite a considerable amount less.

Q. How much water was put into it at that point, can you tell?

A. Just what do you mean by water?

Q. I want to know what the balance sheet was at the close of business of the Capital City Gas Light Company on the 28th day of Febru-ry, at the close of business the 28th day of February 1906, how much did the value of the property increase from 12 o'clock that night until this balance sheet was opened the 1st day of March, 1906.

To the best of my recollection the opening entry of the Des Moines Gas Company shows a plant valuation of approxi-
1781 mately one million dollars in excess of the socalled book value at the close of the existence of the Capital City Gas Light Company.

Q. You mean now it represented an actual investment in property that was substantially or approximately a million dollars?

A. No, sir; it did not represent an investment, that is why I eliminated it from my analysis of the construction account.

Q. The books showed there had been put into the business approximately a million dollars, isn't that truth of it?

A. The adjusted balance sheet for the opening of the business of the new company shows——

Q. I am not asking you about that, I want to know if it is not the truth that the books showed at the close of the business of the Capital City Gas Light Company the 28th of February 1906 that the actual investment in property was approximately a million dollars?

A. I don't remember it, I don't think so.

Q. Don't you remember it was approximately a million dollars?

A. No, sir; I don't recall the figure.

Q. And with the working capital in there included was about $1,156,000 something like that?

A. I don't remember it.

Q. Can you get that balance sheet and refresh your recollection on that subject.

Objected to as not cross examination and in that connection we will say that these books that they are talking about are now being examined by their expert so there is no question about their not having this information, if they want it, I think they ought to get it instead of trying to send this man to work for them.

1782 Q. Why did you start out in this report by showing this particular balance sheet, what is the purpose of it?

A. That is the beginning of the business of the Des Moines Gas Company.

Q. Then you wanted to show and have the Master understand didn't you that the books of this company showed an investment up to and including December 31, 1910, of $3,853,974.22 didn't you?

A. Emphatically no, because if I had I would not have presented

the Master as I have explained three times the investment in the books through analysis of the construction account as $1,928,016.

Q. What was the significance of placing the balance sheet in here?

A. Because that is what the books show but this is what I found upon analysis.

Q. That is the question I want you to answer, you did want the Master to know that the books showed an investment of $3,853,-975.22 didn't you?

A. I wanted to present to the Master an actual statement of the company's books but supplement that with my analysis of the statement and that it was not the valuation of the property there in question?

Q. If you want to be eminently fair to both parties why didn't you in connection with the balance sheet show the Master the condition of the Capital City Gas Light Company the immediate predecessor of the complainant company at the close of its business on the 28th day of February 1906?

A. Because in the analysis of the balance sheet for reproduction in my report I had to begin somewhere and the logical point was to begin with the beginning of the history of the Des Moines Gas Company. I made my analysis of the construction account in this balance sheet not only the last year of the Capital City Gas
1783 Light Company, but back to 1886 and through that analysis I eliminated every item which I consider was not the fair valuation excluding what you choose to call water.

Q. You went back to 1887, as far back as you could get trace of the investment, trace of these extensions and trace of the manufacturing plant and history of it and all these things?

A. I did.

Q. Why didn't you go back of 1906 in connection with your investigation of the books for the purpose of showing the trial balance when you were not pursuing the reproduction theory?

A. Because I attach very little significance for rate making purposes to the book cost as shown in the company's balance sheet. I believe that should be analyzed and eliminated if there have been any items which were not proper construction charges and I found such charges.

Q. But you have said in carrying out your theory and in arriving at the value of this investment that it is highly important to have the actual expenditures of the company and the books of account to show the amount actually invested, you said that haven't you?

A. Exactly and in accordance with that I produced this company's analysis and not merely the book figures.

Q. If it is the fact that at the close of the business the 28th of February 1906, the investment, according to the balance sheet showed approximately $1,000,000, you considered that didn't you in arriving at the valuation of this investment, didn't you consider that?

A. To this extent that I went through the year 1906, the last year that is up to February 28, 1906, I went through that year just as

I went through every year preceding and following in the
1784 analysis of the construction account. I saw the company's book cost and I have carried forward my analysis construction cost. I would find that the company would charge an amount say of $25,000 to construction and I made inquiry as to whether that was a legitimate construction account for the purposes of this case and satisfy myself it is not. I therefore correct my construction and analyzed the total record forward eliminating that item. The next year the company makes an additional item of construction and I analyzed that and see whether it should be eliminated or not and so that way I perform what you have in your mind in wanting to present to the Master the cost of the property rather than the book statement of the property.

Q. What did you find was the investment of the Des Moines Gas Company on the 31st day of December 1910, at the close of the calendar year 1910?

A. $1,928,016.65.

Q. Now have you information for the Master so that he may know what you found the investment in the property was actually on the 1st day of March, 1906?

A. Do you mean the actual investment as opposed to the book cost on that date?

Q. Yes, as determined by you.

A. That would be the total of all the amounts in the last column preceding the total for the year 1907 or to deduct from the total at the foot of the column the last five items.

Q. If you will turn to Schedule 1 of Exhibit "B" you have shown there the totals have you not of the expenditures of the Capital City Gas Light Company from June 30, 1886, down to and including February 28, 1906.

A. Yes, sir.

1785 Q. And under the column headed "Totals" you have left a space between the business of the Capital City Gas Light Company and that of the Des Moines Gas Company?

A. There is a space there.

Q. These items have a relation to the business of the Capital City Gas Light Company represent extensions and improvements, street lamp extensions, extension of street mains, meters and services, everything in connection with their business.

A. Yes, sir.

Q. Now I wish you would follow me. I have taken the totals of the Capital City Gas Light Company from the period to which I have called your attention and I find that these figures shown in this column total an aggregate of $1,117,655.89. I wish you would run over those figures and see if that is correct?

A. I get the same figure you have, $1,117,655.89.

Q. Now the credits that are shown in the 4th column, were those corrections made by you or are these credits shown upon the books?

A. They are on the books as I recollect it.

Q. That was the close of the business February 28, 1906?

A. Yes, sir. That represents my detailed book cost and not the

company's book figure. The company book figure was larger than that.

Q. How much larger?

A. I don't remember, must have been larger because I have eliminated a number of items in earlier years.

Q. Was it in excess of $1,165,230.09?

A. I don't remember the figures because I have not the record of the amounts I scheduled.

Q. It is a fact isn't it so far as the company's books are concerned and the value of the investment shown thereon your figures
1786 and your computation don't differ materially from those shown upon the books up to that point?

A. I have made some deductions, I don't recollect now what they were because I paid no attention to the company's book figures, but took the actual cost for rate making purposes.

Q. Your exhibit "B" shows all extensions, mains, meters and services covering the period from 1886 to 1906 is this amount $1,117,855.89?

A. Yes, sir.

Q. Now I wish you would take the years 1907, 1908, 1909 and 1910 and analyze those for us, tell us what they represent.

A. Actual charges to construction during those years in question.

Q. As shown by the company's books?

A. As shown by the company's books and after eliminating what I believe were not proper construction charges.

Q. The total to which I have called your attention is $1,117,-655.89.

A. Yes, sir.

Q. And the next column that is the business of the Des Moines Gas Company, the next item for the 12 months ending February 28, 1907, starts out with the figures $289,943.78. Now does that represent the amount of money expended by the company during that year for extensions?

A. It represents the amount of money expended and the value of the property added to the plant during the 12 months ending February 28, 1907, that amount being for extensions and improvements in the first column, Schedule 1, of Exhibit "B".

Q. Have you any way of telling us, Mr. Hagenah, just how many miles of mains, for instance were laid in that year?

A. No, sir; I have no record of mains.

1787 Q. Do you — — what works improvements were made?

A. No, I don't recall the individual construction operations carried on during those years.

Q. This $289,943.78 which is the first amount that you used in connection with the Des Moines Gas Company's business, in this inquiry, I would like to have you analyze that for us and tell us just exactly what it represents?

A. That represents expenditures for actual property added to the plant that I have placed the amount of $285,000 for property received and added to the plant during that year.

Q. Can you itemize it and tell us what property?

A. No, I can't recall the individual items of property making up the total items of charge that year.

Q. Can you get it for us?

A. It is all on the company's books your men are working on I suppose.

Q. You say that on the books everything is there representing what this $289,943.00 represents, you say it appears on the company's books?

A. It appears there though every item on the company's books is not gone into in detail like every other item. I received all my information from the books and records.

Q. That appears to be there much larger than the items following?

A. Exactly because that year the company added more property to its plant.

Q. Just what I want to know, I would like to have you give us the items or a statement of that particular item.

A. I can give some of the items I recollect.

Q. Give us some of them?

A. One of the items is the large million foot holder.

1788 Q. When was that million foot holder constructed?

A. I don't know when it was constructed, but this is the first time I find it in the records in the charges for 1907.

Q. When did you first see that account on the company's books?

A. In the opening of the company's books on February 28, 1907.

Q. So then it must have been constructed in the year 1907 to be properly in that account?

A. It is possible it was constructed earlier than that.

Q. It would appear in some of these other accounts?

A. Not necessarily unless the construction account covering this particular operation was closed into the plant account in that year.

Q. You have gone back to 1886, you have endeavored to show here the extensions of mains and the street lamp extension and street main and you have endeavored to show by this table the value of the investment covering this period. If that gas holder were considered or had been constructed back in some of these other years, can you explain why it should go into that account after February 1907, or covering that year?

A. Yes, sir. An item is not always put into the construction account at the day when the construction is begun. The policy in regard to that is to receive authority to undertake a particular piece of construction and during the construction of that article the expenditures in connection with it are charged to the particular authorization or work order and when it is completed it is closed into the construction account as it appears in the company's balance sheet. New construction may continue over a period of six months or a year or possibly longer and it will appear on the company's books as an addition to plant when the authorization or work

1789 order is finally closed into plant account.

Q. Of course I take it you have no personal knowledge or any information with respect to this particular item?

A. I have this much knowledge that the Des Moines Gas Com-

pany began business on March 1, 1906, taking over the business of the Capital City Gas Light Company and various other properties inclusing the Valley Junction property. The consolidation which took place really represented three forms in which the Capital City Gas Company was one specific item, the Valley Junction property, as I recall that and various other property then in course of construction which was closed into the accounts and first appears on the books of the new succeeding company, the Des Moines Gas Company.

Q. You can bring in I take it, Mr. Hagenah, tomorrow morning a list of these items that is $289,943.78 and the items which follow in that column.

A. I could bring in only what appears on the company's books and your men are working on that.

Q. You say as I understand you, these are not the exact amounts as shown by the company's books, your valuation?

A. The company's books for any one year may show a considerable more than the amount my figures show.

Q. That is what I want to get is the memorandum or data upon which you arrived at these amounts. I refer now to these figures in the business of the Des Moines Gas Company covering the period February 28, 1907, to December 31, 1910, under the heading extensions and improvements.

A. I don't know what specific items enter into a charge for property embracing a number of items at any one time. The books do not show that.

1790 Q. Do/'t the books show the amount expended for the purpose referred to in that column for that year?

A. Yes, with the detail which I give here and when I found that item it was so large my curiosity was aroused and I asked what were these specific items which went into this construction account.

Q. Have you got those?

A. No, sir.

Q. Where are they?

A. I haven't them.

Q. What did you do with them?

A. I never got them.

Q. From whom did you get your information?

A. Officers of the company.

Q. Is there anything on the books to show?

A. They do not refer to the books of the company. I asked for what construction there was to make that item so large and one of the items to which I was referred was the million foot holder. Another item to which I was referred was one and I think two parcels of real estate at that time which are inclusded in here. You will see my table has no solumn for land. I have put land in with improvements or extensions.

Q. That $289,943.78 includes something for real estate?

A. It does.

Q. How much?

A. I don't know. I don't know the value of the property and don't know exactly how much they paid. The cost might appear

upon the books but the cost of several articles, and I don't know how much each particular article was worth.

Q. The sum total of all the items would aggregate this sum, $289,943.

A. I might give the items going to make up one large
1791 item in that column amounting to $285,000. I don't remember what the other scattered items were to make up the other $4,943.

Q. The information you received in regard to that item was from the employés or officers of the company and not from the books themselves?

A. No, sir. The books show it in one item to the amount of $285,000 but I don't know what made up that.

Q. One *time* was the million foot holder?

A. One item was the million foot holder and another item was one and I think two parcels of real estate at that time. Now I also think there was included in that certain property in Valley Junction.

Q. You went over the inventory Exhibit 15 did you?

A. No, sir; I have not seen the inventory.

Q. Was it every furnished to you?

A. No, sir; I may add in explanation of my answer if it is proper, the reason I did not go into the proper value to be allowed for either one of these items was because of the fact there was an inventory and valuation here. Now if the holder is included in the $285,000 I respectfully suggest that one way of finding the reasonable co-t of that would be to refer to the appraisal and see what a holder is worth and what is the value of such parcels of real estate.

Q. Of course I thank you for the advice, but have you found upon the books of the company any record showing the several items going into this $285,000 item which went into that item?

A. Not detailed on the books, no sir.

Q. You relied upon the information that was furnished you by the employés or agents of the company?

A. Yes, I was informed that the holder and certain real
1792 estate and certain property in Valley Junction was included in that total charge.

Q. Now I would like to have you tell us just what items of property are included in the extension and improvement *ad*count as detailed in Schedule 1, Exhibit "B"?

A. In general all the property in the company's inventory and property which it possessed consisting of street lamps, mains, meters, services, to be specific, it would include land, buildings and making apparatus and holders.

Q. How about the furniture and that sort of thing?

A. That would be included.

Q. Take page 43 of Exhibit 22, being the table showing annual investment on the 8 per cent earning basis I believe you have stated that you computed the depreciation on a percentage of two per cent?

A. And two and one fourth, also.

Q. Where did you adopt the two per cent basis, where is that shown in this report.

A. It is not in there. I completed that work after I came here. I checked over my figures and came to the conclusion that the amount I used at the time I worked up this report was too high.

Q. Have you undertaken to compute what that depreciation would have amounted to at this time on a basis of two and three fourth-per cent compounded annually?

A. No, I think that is too high, I would not want to be quoted as favoring that now.

Q. I say did you?

A. I did not.

Q. I want to know if you computed the amount that ought to have been on hand on that basis?

1793 A. I did not.

Q. Did you compute the amount which would be represented in that fund on a two and a half per cent basis?

A. No, sir.

Q. Let us have the tables which you did use. Before we take up an analysis of the tables which you have prepared, I would like to ask first which of these amounts you stand on? You start out with two and three fourths, two and a half, two and a fourth and two per cent.

A. I favor the lowest one which is two per cent showing a valuation of $3,136,241.

Q. When did you reach the conclusion that two per cent was a proper amount to use?

A. I am not perfectly satisfied as to that yet. I have not had all the information which I would want to thoroughly analyze what constitutes a proper depreciation rate. In the absence of that and in order to be conservative I took what I thought was a conservative figure of two per cent.

Q. Circumstances and further investigation might cause you to change even the figure of two per cent and adopt something lower?

A. I might upon further information arrive at some other figure but from the information which I have had so far my best judgment is two per cent on the depr-ciable property.

Q. On a sinking fund basis what results or what amount would we have if we used one per cent compounded for forty years?

A. I don't know what it would amount to. I have not figured it out. If I had had tables showing the life of all the classes of property and ages so I could compute the composite life and composite age I would have arrived at a figure probably different from two per cent but not very far from that.

1794 Q. Well then as far as your report here, or in arriving at the value of this investment, you are willing to concede you were too high when you figure on the two and three fourths basis and two and a half basis?

A. I think those are too high.

Q. When did you make up the tables, Exhibits 25 and 26?

A. During the last week or ten days.

Q. Was it since you heard the testimony of either Mr. Baehr or Mr. Lea?

A. No, sir; I came to that conclusion entirely independent from anything that was said here. I didn't hear their testimony on that.

Q. I simply wanted to know if you learned through their testimony or from other reports the composite life or age of this plant as they had computed it?

A. I did not hear their testimony on that and don't know what their judgment is on that.

Q. Then even the tables, Exhibits 25 and 26, do not represent your judgment after a careful and painstaking investigation of the amount that should be charged off for depreciation?

A. Yes, they represent my present best judgment but I have not the information to arrive at the depreciation rate as I compute it in other cases. If I had that information I would arrive at the rate and then compute the table in the same way substituting the rate and I have analyzed the depreciation rate in other cities under conditions very much similar to those here and there I found a rate substantially two per cent as being sufficient, being near enough accurate for all practical purposes.

1795 Q. This table shown at page 42 of Exhibit 23, shows that on the two and a half per cent basis you reach a value of the plant at the close of the year 1910, of $3,343,794, that is on the two and a half per cent basis whereas where you reduce that to two per cent you secure as a final result, $3,136,241. In other words the substitution of the two per cent for the two and a half makes that difference in your final results.

A. Yes, sir.

Q. And where you adopt and use two and three fourths per cent as the basis of your calculations, you procure a sum of $3,484,586 so that it makes the difference between that and $3,136,241 a difference there of about in round numbers $300,000?

A. Yes, sir; and the lowest figure represents my best judgment as to the valuation to be allowed. The others were merely early computations from insufficient data.

Here the further hearing was adjourned until 9:30 a. m. tomorrow.

1796 Tuesday Morning Session.

AUGUST 8, 1911—at 9:30 a. m.

All Counsel for the respective parties present, except H. W. Byers, Esq.

Testimony on part of Complainant resumed as follows:

WILLIAM J. HAGENAH, re-called for further cross examination, examined by R. O. Brennan, Esq., testified:

The MASTER: Just one question as to schedule B. If I recollect

correctly you told me that the total last column did not include the working capital?

A. That is right; it does not include it.

The MASTER: Do you remember what the working capital was at the beginning of 1887—turn to page 43, there is a difference in the first column and the last column in Schedule B, working capital?

A. There is, and it amounts to $13,600.

The MASTER: And you found the working capital at the close of 1910?

A. Approximately $128,000.00.

The MASTER: But that is not included in your totals here?

A. It is not included in schedule B, Exhibit 1.

The MASTER: Do you include in that exhibit working tools and office equipment?

A. Yes, sir.

The MASTER: All but the working capital?

A. All but the working capital.

Mr. BRENNAN:

Q. But your final figures include working capital, do they not, showing the value of the investment?

A. They include the working capital, yes, sir.

1797 Q. Do you know how much you have included as working capital?

A. I included for the year 1910, $128,000.00.

Q. Where is that shown, in what total is the working capital shown?

A. That will appear in the third column of the table on the analysis of the investment value on the eight per cent basis.

Q. Third column, addition to plant including working capital?

A. Yes, sir. The amount of $128,000 is built up in thay column.

Q. And just what items do you use as representing working capital?

A. I arrive at the working capital from analyzing the current asset and liability items in the balance sheet at the close of any particular year.

The MASTER: To get total assets, schedule B, you have to add $128,000?

A. Yes, sir. That is not asset but the cost; there are other assets; That is cost of the plant plus working capital.

Q. Schedule 1—assets and liabilities December 31, 1910; is that the statement from which you made up the item of working capital?

A. For that year, yes, sir.

Q. Do you consider inventories, $77,410.46; is that part of the working capital acocunt?

A. It is, yes sir.

Q. And accounts receivable, $53,627.46?

A. Yes, sir.

Q. And the item of cash, $49,434.15?

A. Yes.

Q. I wish you would take these account-, Mr. Hagenah, and follow me, see if we understand each other. Take the amount of $77,410.46 and the next item, accounts receivable, $53,627.46—will you put down the figures please—and $49,434.15. Now the aggregate of those figures or total is how much?

1798 A. $180,472.07.

The MASTER: What is that?

A. That is the sum of the amounts shown in the balance sheet for 1910 for inventories, accounts receivable and cash.

Q. Now what do you do with account payable and bills payable?

A. You mean in arriving at the working capital?

Q. Yes.

A. I would deduct those items.

Q. Now those items amount to, bills payable $14,000; accounts payable $39,607.29, and the total amount is $53,607.29—is that right?

A. Yes, sir.

Q. That is to be deducted then from $180,472.07?

A. Yes, sir.

Q. And what is the amount after making the substraction?

A. $126,864.78.

Q. Now what do you do with taxes?

A. I don't consider taxes working capital.

Q. You don't consider taxes as working capital?

A. No, sir.

Q. Do you deduct taxes from the amount which you consider for working capital?

A. I pay no attention to the item of taxes in computing the working capital?

Q. Why not?

A. It does not appear in the balance sheet as being an item involving the use of funds other than as it appears in the expense statement of profit and loss.

Q. Where do you get the other two thousand, approximately two thousand?

1799 A. I add to that amount $905.20 which is unearned insurance and represents the payments for insurance in the form of premiums for several years in the future.

Q. Is that shown on the balance sheet?

A. It is.

Q. This $905.20 on the unearned insurance?

A. Yes, sir.

Q. You say you paid no attention to taxes?

A. I have not in the preparation of my working capital statement.

Q. What accounts are included in the item of accrued accounts amounting to $58,817.07, shown at page 3 of your report?

A. It includes taxes and interest.

Q. And at page 13, schedule 1 of Exhibit 1, you show accrued taxes?

A. I show the details there, yes, sir.

Q. Did you get the detailed information with respect to the items we were talking about last night, Mr. Haganah?

A. Which items do you refer to?

Q. The first item of your table at the commencement of the business of the Des Moines Gas Company?

A. Details of the item $285,000?

Q. Yes.

A. No, sir; I did not understand that you asked me to get any additional information on that.

Q. I asked you to get us the detailed information by which you arrived at that amount of $285,000, in round numbers.

A. That is the item which we were discussing. The details of that are not on the books and I got my information through inquiries. I told you yesterday what items were included in it, but as to the particular value to be attached to any specific item, I am unable to say. As far as I know it included the million cubic feet
1800 holder, one or two parcels of real estate, certain property in Valley Junction and a 100,000 gallon oil tank on the premises of the company.

Q. Now, let me understand you—the additions to plant from 1886 to 1910, both inclusive, your final totals are $1,928,016.65; that you say is the value of the investment?

A. No, sir; I say that is the cost of the property.

Q. Does that include any working capital?

A. It does not.

Q. Where you used extension and improvement in the first column what items are covered by extensions and improvements?

A. It includes all the property of the—that is, of the physical property of the Des Moines Gas Company and the Capital City Gas Company during the years shown on this table, except the street lamp extension property, mains, meters and services. Some of the specific item- included in that column are land, building, manufacture equipment, holders, oil tanks, etc.

The MASTER: What does it exclude?

A. It excludes the street lamps, mains, meters and services; everything else is included in the first column.

The MASTER: It excludes the street lamps?

A. Yes, sir; street lamps, mains and the street service pipes.

Q. Can you give us the detailed information with respect to the item of $32,781.82?

A. No, sir; I haven't those details with me.

Q. Did you include anything for discount on bonds?

A. No, sir; not to my recollection.

Q. Have you anywhere in this report considered that?

A. I have not.

Q. You make no allowance for that in any way in your report?

1801 A. I do not recall that there is any allowance in this report for discount on bonds.

Q. Well, in a general way, Mr. Haganah, can you tell us what you considered in this $32,781.82?

A. That would represent the additions to property in the form of lands, buildings, manufacture equipment holders and oil tanks during that year, if there were any—I do not recall what items of that character were added that year.

Q. These are all the items included in that amount $32,781.82?

A. Yes, sir; items of that character would be included in that amount.

Q. Are there any other items that you have not specifically mentioned?

A. I do not recall any.

Q. Now the next is February 28, 1909, $13,881.29; what are the items which are used to arrive at that amount?

A. They are items of the same character as were included in the same column for the preceding year.

Q. And that is true of the item $44,699.80 immediately below?

A. Yes, sir.

Q. And also of the item $23,470.09?

A. Yes, sir.

Q. And those amounts represent for the respective years the additions in the way of real estate or to the apparatus or buildings of the physical property of the company?

A. At the works, other than street lamps, mains, meters and services.

Q. There is no working capital or discount on bonds or accrued taxes or anything of that sort included?

A. No, sir; only physical property.

Q. Now, Mr. Haganah, to what extent did you go into the books of the company to get this information?

1802 A. I made a thorough audit of the company's books for the last few years. I believe my assistants covered five years in their detailed analysis of all the vouchers and authorizations, of which I personally examined every charge during the year 1900. We went further than that analysis of the construction account from the Company's ledger from 1886, as shown by Exhibit B, schedule 1, in my report. Wherever an item was classed into the construction account, as shown by the ledger, the details of that item were called for, examined and carefully analyzed. Wherever an item was charged to the construction account which I believed was not a proper charge to include in arriving at the cost of the property in a rate case, I excluded it.

Q. In other words, you made up a new set of books for the purpose of this report?

A. Not exactly that. I eliminated from what they called their construction account items which I think are not proper construction account; I have not altered their books in any way.

Q. Could you give us a list of the principal items which you changed so as to conform to this report?

A. I have not such a list with me; I could tell you in general the items which I excluded.

Q. Very well.

A. Expenditures made by the company in the form of investments, that is, for property not used and useful in a public utility; that is one character of items excluded.

Q. Do you remember the amount of that item and the character of the property?

A. I am not sure about that. That item appears on the Company's books.

Q. Well, give us an illustration as to property acquired
1803 which is neither necessary nor useful in the complainant's business?

A. I do not recall any specific item now, not having my data with me to refresh my memory.

Q. Well do you know anything about the amount of such an item as you have suggested?

A. In that particular case the amount was not large.

Q. About how large?

A. I think I am safe in saying it was not in excess of $4,000 or $4,500.

Q. Now was that real estate or personal property?

A. That I am not sure about.

Q. Can you, Mr. Haganah, furnish the Master the data for use a list of the items which you rejected?

A. You- accountants are at present engaged in making that very same analysis and doubtless have completed by this time the list which you desire.

Q. That hardly answers my request.

A. It would take a good deal of time, Mr. Brennan, to go back over these records and get the items which you desire.

—. About how many items were there that you considered erroneous and rejected?

A. I don't remember how many.

Q. About how many?

A. I would not hazard a guess.

Q. How much did the items aggregate?

A. The difference between the amount shown as the total in the last column in schedule 1, Exhibit B, which is $1,928,016.65 and the plant account shown in the balance sheet as of December 31, 1910, which amounts to $3,853,975.22.

Q. Can you give us a list of the large items?

1804 A. I can not.

Q. Haven't you any memoranda of that?

A. Not with me, no sir.

Q. When was this complete audit made of the books?

A. My report was completed on March 8th, 1911, and the audit was made during the month or six weeks immediately preceding I have since I have been in the city continued my work upon the Company's books.

Q. Do you maintain offices in the city of Chicago?

A. I do.

Q. And how many assistants do you have?

A. At present I have six, I believe.

Q. How many did you have in the month of February?

A. About seventeen at that time.

Q. They were working in connection with this Chicago report, were they not, most of them?

A. Yes.

Q. How many of them were assigned to the work of the Des Moines Gas Company?

A. Those who were assigned to the work of the Gas Company were not working for the city of Chicago.

Q. How many had you assigned as your assistants in connection with the Des Moines Gas Company work?

A. For about five or six days there were five people besides myself.

Q. What are their names?

A. Mr. Honnicker and Mr. Wellman. I am not sure now about the names of some of the others; I can explain why. We were completing about that time our analysis of the books and engineering records of the People's Gas Light & Coke Company, and when any person completed his work on the Gas Company's record, he
1805 was dismissed from my employ because I had no further work for him. When this work appeared, instead of them leaving me entirely, they were assigned to work of this kind, and they stayed with me probably five or six days after they had completed their work for me on the Chicago analysis.

Q. Mr. Honnicker was the only assistant who came to Des Moines, as I understood you to say on Friday?

A. Yes, sir.

Q. He was here some five or six days?

A. About that time.

Q. Did you have the books of the Gas Company at your office in Chicago?

A. Not the books, but a large supply of vouchers and authorizations were sent over there for analysis.

Q. Was there anything else sent besides the vouchers?

A. Our data and analysis sheets which were prepared on the ground here.

Q. By whom?

A. Mr. Honnicker and myself.

Q. Was there any other data furnished you by the Des Moines Gas Company?

A. Not for use in connection with this audit.

Q. Well, for use in connection with your report?

A. No, sir.

Q. You first came out here in February, did you not, about the first week?

A. I see I left in my room my note book on outside work. I was working on that last night and forgot to put it in this book. As I recall it I made two visits to this city in February.

Q. You made five trips in all, as I recall your testimony?
1806 A. I don't remember, but I answered your question correctly the other day in regard to that.

Q. I think you said you were here four Sundays, came from Chicago Saturday night and stayed here Sunday and left Sunday evening, and you were out here five times in all?

A. I don't remember how many times; I was here every time on Sunday except once.

Q. Mr. Honnicker was here some five or six days?

A. About five days.

Q. And in that length of time, you told the Master, you succeeded with Mr. Honnicker as your assistant to make a complete painstaking auditing investigation of the books and records of the Des Moines Gas Company covering the years from 1886 down to 1910 inclusive?

A. No, sir; we done nothing of the kind.

Q. Tell the Master what you did do?

A. We made an audit of the last few years in which we did analyze every item and analyzed the construction account of the ledger from 1886 to the end of 1910. Such work as we did not complete in this city we completed in Chicago. I had at once time five or six of my own people at work, and while working in this city both Mr. Honnicker and myself, whether we worked alone or together, we had the services of the employes of the Des Moines Gas Company who were familiar with handling the books and in bringing to us the books and records which we called for, so that we were not compelled to spend any time in searching through the vaults and shelves for records. As soon as we found it necessary to examine any particular document it was asked for and the party who was most familiar with that was assigned to get it for us and kept us supplied
1807 with everything we needed. We worked more than what you might assume would constitute a day; we began our work about eight o'clock and worked until about midnight.

Q. That is as definite, Mr. Haganah, as you desire to answer the question?

A. Yes, sir; that is the way in which I would describe it without specific memoranda or data.

Q. What years did you investigate and thoroughly audit?

A. Mr. Honnicker was instructed to audit all the records of expenditures and to verify the balance sheets and to prepare trial balances to see if the books were in balance and I analyzed the items in the trial balance to satisfy myself of their correctness during the history of the Des Moines Gas Company; that is the best of my present recollection.

Q. Those were the instructions to Mr. Honnicker now?

A. Yes, sir; and he brought to me the working sheets covering the analysis for the record at that time.

Q. Did you go over the records and verify them in any way?

A. Yes, sir, I did. I applied such checks and study of his records as I ordinarily do in analyzing data which are brought to me in the course of my work.

Q. Now, this depreciation account, Mr. Haganah, have you considered what the amount you have computed here on the basis of two per cent. invested at eight per cent, would amount to at the end of 37 years?

A. No, sir.
Q. Can you figure that up in a few minutes?
A. No, I can't. I can tell you why I did not do it.
Q. Tell us why you didn't.

A. Because no depreciation reserve would be permitted
1808 under practical conditions to accumulate for that length of time. A plant is constantly depreciating; to offset that depreciation the Company is required to set up a depreciation——

Q. Now——

Mr. GUERNSEY: I submit that the witness be permitted to answer the question.

Answer continued. That reserve is built up by crediting it each year with the amount representing the estimated annual depreciation during that period, which amount is included in *in* the operating expenses as one of the expenses of the business. Now, since depreciation is going on constantly and replacements must constantly be made, these replacements will be charged against the depreciation reserve which was credited to meet these renewals by an amount representing the estimates in the annual depreciation. Consequently under normal conditions the depreciation credit which has been charged to operating expenses will each year be exhausted by the charge for replacements. Under normal conditions the depreciation each year will not be the same as the estimated depreciation. Some years the replacement will be made to a heavier extent than other years, and it is possible at sometime you will have a debit balance and at other times accumulate a credit balance. The balance does never accumulate to the amount of eight per cent or any per cent on that credit for the period of thirty years. If that were so you would have at the end of the normal life of the property a balance representing the value of the property, and you would have no property. Therefore since your plant for all practical purposes in supplying the public with service can not depreciate below about seventy-five per
cent before the service is seriously impaired, your depreciation reserve could never reach the point you have in mind.
1809

Q. Did you go over the history of the plant and over the vouchers to test out that theory to see just what replacements had taken place the last five or six years?

A. Not for that long a period. I tested the company's books for about two years to see what its policy had been with respect to the renewals and the accounts charged.

Q. Now, Mr. Haganah, what replacements if any are there not included in the $1,928,000.

A. There are no replacements included in the $1,928,016.65.

Q. What about operating expenses?

A. They were included in 1910.

Q. To what extent have you got detailed information on that?

A. Schedule 5 of my report shows that there was incorrectly included in the operating expenses for 1910 the sum of $7,351.92 against which there should have been a depreciation allowance as shown in the same schedule.

Q. What schedule is that?

A. Schedule 5 of my report.

Q. Page 22, is it?

A. I don't know the page; my report is not paged.

Mr. GUERNSEY: Yes, it is page 22.

Answer continued: It is the last item in the third column on that page.

Q. What replacements have occurred in the last 24 years?

A. That I don't know.

Q. Did you try to ascertain?

A. I could not determine it.

Q. Was there any expense that you have not included either in this $1,928,000. or in your operating expenses?

1810 A. For which year?

Q. The entire period of twenty-four years shown on this report?

A. Yes, the expenses I referred to a short time ago as being made and charged to the construction account, but which I eliminated as not being proper construction charges for the benefit of this case.

Q. What were those items?

A. I do not recall them.

Q. Outside of these items, Mr. Haganah, were there any other charges not shown in the operating expenses or in the totals which you show here amounting to $1,928,000.

A. I have been trying to think of some; I can't recall now; there may have been some; I can't recall now.

Q. These items which you rejected as not belonging to the construction account do they represent replacements?

A. No, sir.

Q. What do they represent?

A. They were in the form of adjustments in the books to recognize the changed conditions. A specific instance of that kind, is what you had in mind yesterday afternoon in comparing the construction account in the balance sheet at the close of the history of the Capital City Gas Company with the construction account of the first balance sheet of the Des Moines Gas Company.

Q. I would like to know if you can tell us just what items you rejected as being improperly included in the construction account?

A. They represented expenditures for property of an investment character, as I told you a few moments ago, the expenditures for property which may at one time have been used or purchased with the intention to use it in the gas utility, but not actually

1811 so used.

Q. You know that?

A. I know there were instances, or at least one instance of that kind.

Q. Let us not deal in generalities so much; you rejected certain items which you found as being improperly charged in the construction account; now you had some reasons for rejecting those items, did you not?

A. Yes, sir.

Q. You thought they did not properly belong there?

A. Yes, sir.

Q. You say they did not represent replacements?

A. Yes, sir.

Q. Now, can you remember just what it was and won't you please tell us?

A. We got so far yesterday to show that the total———

The MASTER: Can you tell; say so, if you can't.

A. I cannot without referring to other data.

Q. What other data must you refer to in order to tell us just what items you excluded from the construction account.

A. The Company's ledgers.

Q. And by looking at the Company's ledgers you would be able to tell us?

A. I could cover the ground I covered in the first place and I am confident would eliminate the same items now I did then.

Q. Did you have any personal information outside of that shown on the ledgers or books of the Company?

A. Only with respect to the item of $285,000. which you discussed for some time yesterday.

Q. That you know all about of your own personal knowledge?

A. The information was given me after I inquired for details.

Q. Just mere hearsay so far as you are concerned per-
1812 sonally?

A. Exactly.

Q. You have not worked for the Des Moines Gas Company before February 1911?

A. No, sir.

Q. You have never been in the employ of the Des Moines Gas Company prior to that time?

A. No, sir.

Q. Do you remember talking with Mr. MacVicar in Chicago concerning this case?

A. Yes, Mr. MacVicar called on me one day.

Q. Do you remember when that was?

A. About the 22nd or 23rd of May.

Q. And Mr. MacVicar talked with you concerning securing your services for the city of Des Moines in this case?

A. Yes, sir.

Q. I believe you told him, did you not, Mr. Haganah, that two or three years before that you had performed some services for the Des Moines Gas Company. While you would be glad to take up the work for the city, you would have to get some sort of a release or felt that you should from the Des Moines Gas Company, or that in substance?

A. I didn't tell him anything of the kind. I never had any connection with the Des Moines Gas Company until this matter first came to my attention.

Q. Did you tell Mr. MacVicar that or that in substance?

A. You have included two questions; if you will separate them——

Q. Did you tell him that or that in substance?

A. I didn't tell him anything of the kind. I told him in substance all of a part of your question and nothing like the other part.

Q. Why are you dodging, why don't you tell us what he
1813 said to you and what you said to him.

Complainant objects to the form of the question and the suggestion to the witness that he is dodging, as being absolutely unwarranted by anything the witness said on the stand.

Q. Mr. MacVicar talked with you about serving the city of Des Moines in this case?

A. Yes, sir.

Q. And you said to him, did you not, that about two years prior to the date of this conversation you had performed some services for the Des Moines Gas Company and that you did not feel at liberty of entering into a contract with the city without first explaining the situation to the Des Moines Gas Company.

A. Absolutely not, in the slightest degree.

Q. Or that in substance?

A. No, sir. We discussed the Des Moines Gas case but nothing like what you say.

Q. There was nothing said about why you wouldn't work for the city without first getting their release?

A. That is a different matter. Mr. MacVicar came to me on the 22nd or 23rd of May and asked me if I could assist the city of Des Moines in this case. My report to the Des Moines Gas Company is dated March the 8th, and I told him I had made an audit of the Gas Company's books and for that reason I felt that I could not serve the city of Des Moines, telling him if it were agreeable to the city and to the Des Moines Gas Company I would gladly make an audit and submit this to the court for the examination of any data which both parties would agree to. That in the absence of the
Des Moines Gas Company agreeing to such an arrangement
1814 I could not accept any other services.

Q. Did you tell Mr. MacVicar at that time and place that you were then in the employ of the Des Moines Gas Company?

A. I do not believe I did. I was not in the employ of the Des Moines Gas Company at that time.

Q. Did you tell Mr. MacVicar you had made a report for the Des Moines Gas Company or the United Gas Improvement Company?

A. I don't remember that I used the word report. I told him I had made an audit of the Company's books and I had been in Des Moines to do that, and for which reason I felt it would be improper for me to accept the service of the city of Des Moines in the case against the Des Moines Gas Company unless both sides knew the character of my services.

The MASTER: I want to call your attention to page 30. There is $7,251.92; I see it there twice. Is that a duplicate charge?

A. No, it is one charge. I analyzed it on page 30 showing that of the total amount $7,351.92, the sum of $6,087.17 was really incurred for replacement purposes and should not have been called a maintenance charge, and that the larger sum also included $1,264.75 which should have been charged to the construction account and not

against the operating expenses; I have then carried forward this total of $7,351.92.

The MASTER: Evidently there is a clerical error in that; those two amounts do not agree and they should.

A. I will look at my own copy; I think they should agree. In making this copy the stenographer made a mistake. My report shows that amount should be $6,087.87; in copying it the stenographer used a nine instead of a cipher. The amount charged to
1815 replacements in maintenance for the year ending September 30, 1910. should be $6,087.17, instead of what the stenographer has shown to be $6,987.17, the nine should be erased and a cipher substituted.

Q. You were present at a meeting of the sub-committee of the city council of the city of Chicago, which was held at the city hall, I believe, on the 6th day of January, 1911?

A. I believe so.

Q. Among other proceedings had by that body was a discussion of your report that you had submitted to the Committee?

A. I would hardly call it a discussion of the report.

Q. Well what was it?

A. It represented rather an expression of disappointment over certain parts of my report.

Q. You did discuss the report?

A. I tried to defend my report against one or two criticisms that I thought were unfounded.

Q. The subject of going value was one of the very many questions that you discussed and were discussed with reference to your report?

A. Yes, there was a good deal of discussion.

Q. Let us find out if you said this—I am going to ask you if at that meeting you used this language, speaking of going value: I found that this amount was practically 23,000,000; that was so enormous that I was suspicious of its accuracy. We had a number of conferences in which the details entering into this enormous sum were discussed. Do you remember saying that?

A. I discussed the subject. I don't remember the exact words.

Q. Did you say that or that in substance?

A. Substantially that.

Q. Continuing: I found the price included an amount —
1816 which the officers were parties in interest and as appeared to me had secured for themselves, that is they took advantage of the market furnished for a franchise and found a comfortable margin of profit in it for themselves. Did you say that?

A. Substantially so.

Q. And further: Let me explain how that might have been done. A man might go to the council and ask for a franchise and there might be a very vigorous opposition, but through various means in which aldermen might be interested finally the franchise might issue on the ground that there was a reasonable cause for believing that a competing gas company in a certain district in Chicago was desirable. Did you say that?

A. Substantially.

Q. And further: Well having convinced the city authorities that there was reasonable ground for another gas company, a franchise was granted. Did you tell them that or that in substance?

A. Substantially so.

Q. Then to further illustrate your theory of going value, did you use this language: Let us assume that the actual cost of this franchise was $100,000 and that the price which the owners of the franchise ask from the company was $500,000; let us also assume now that the officers of the company which decided to purchase the plant felt that in order to relieve themselves of this competitive condition they might themselves become interested to the extent of some personal profit and that instead of paying $500,000 they might have paid $1,000,000 for the franchise, or might pay $700,000. Do you remember saying that?

A. Substantially so.

1817 Q. And further: What became of that $700,000. I don't know somebody got it. I had reason to believe some men connected with the gas company got some of it. I did not believe the people would have got an ordinance through the council because the price was very exorbitant. So I came to the conclusion which I verified to my own satisfaction that this $23,000,000 ought to be reduced by what I believed was the profits to those who have participated in the transaction. Did you say that or that in substance?

A. Substantially so.

Q. And thereafter you were asked this question, I think by Prof. Beemis: Did you make a separation so as to determine how much of that $10,000,000 represented what you talked about a few moments ago, losses of operation of those old companies before 1897? Professor Haganah: I tried to do that so far as the material which the company had was available. I believe they gave me everything they had; they were very anxious to sustain a much larger figure than I finally established. Was that question propounded to you and the answer given substantially as quoted?

A. I believe so in substance.

Q. And that so far as the Chicago report is concerned as to this going value you arrived at it upon that basis?

A. You read only a very small part of the testimony.

The MASTER: It strikes me, Mr. Brennan, this is a little collateral.

Mr. BRENNAN: I am trying to get at his theory of arriving at his going value.

Q. You found they ought to be compensated to the amount of $10,000,000?

1818 A. $10,000,000 I thought was a fair allowance for the elements which I considered.

Q. Mr. Haganah, when you state you did not take into account mains and services under the pavement in this report, do you mean you made no charge on that account?

A. May I ask whether I included in the cost of construction the

cost of pavement over mains not laid or paid for by the company.

Q. I want to know whether in this $1,928,000 anything is included therein for mains and services under pavements placed there in advance of the pavement?

A. The cost of the mains and services is in there.

Q. But as to any additional charge made by reason of the fact that the mains are now beneath the pavement or that the services are beneath the pavement?

A. No, sir; there is no cost included for the cost of pavement over mains and services not laid and paid for by the company.

Q. I would like to have you explain to the Master just how you treat pavements?

A. I have not treated it in this case. I just analyzed the construction record. Wherever the company did not pay for pavement it would not appear on their books.

Q. How much of this amount includes mains and services put under the pavement?

A. I don't know how much of the mains and services was under the pavement for which those charges went on the books.

Q. As shown by the books in the construction account, doesn't it show there?

A. No, sir.

Q. For instance, if they extend a main in a street now paved, will the construction account show that?

1819 A. Not the account itself; you would have to go further for additional information.

The MASTER: There is no way of ascertaining that so far as the evidence now is concerned excepting possibly through the evidence of Mr. Moul and Mr. Lea. Mr. Moul says about seventy-five per cent of the pavements were laid where there was no mains, and Mr. Lea's record shows, I believe, about 46-1/10 per cent.

Mr. BYERS: You mean 75 per cent of the mains were laid where there was no pavement?

The MASTER: Yes. Now Mr. Lea calculated, as I recall it now, it at 46-1/10 per cent. I am calling your attention to that because it becomes a material question in the case.

Q. So I understand you so far as the books of the company are concerned you do not include any item for street mains or services extra items growing out of street mains or services located under pavement?

A. There is no expense included for pavement which the Company did not actually incur.

Q. And if you found there had been any items of that kind showing that the mains had been put in the street before the pavement was laid, you would have considered them in your report; I mean now extra expense?

A. If there had been an adjustment of the books on account of pavement or accrued value because of pavement laid there and paid for by the city, in making a cost analysis of the plant I would have

to exclude that because the cost had not been incurred by the company.

Q. That would be true if you were valuing the investment?

A. In making a valuation of the investment upon the
1820 basis in this report, I would necessarily have to exclude it because I am dealing with book figures.

Q. I say in making a valuation of the investment and analyzing the books, records and accounts of the company you found the major portion of the mains and services had been placed in the streets in advance of the pavements you would not consider the *the* fact that since that time pavements have been constructed by the company and therefore the company should be entitled to have that fact taken into consideration?

Objected to on part of complainant as not cross examination, incompetent and because it is simply asking the witness for information which is one of the ultimate questions of law which will have to be submitted to the court.

The MASTER: There is a good deal of force in that.

Mr. BRENNAN: You take his report and it goes on to tell the *the* conditions existing——

The MASTER: Answer the question.

A. I would exclude it if I were making a cost analysis of a company's books.

Q. Why would you exclude it?

A. Because it would not appear on the books as a cost incurred by the company.

Q. Is that the only reason?

A. Yes.

Q. You have got some matters in this report not shown on the books, haven't you, and you used your own judgment as to how you analyzed it?

A. May I ask what item you have in mind?

Q. You have said that generally with respect to items that
1821 you have taken the books and records and made your analysis of them.

A. I have eliminated from the construction account certain items which do not properly belong there, and I think any accountant who has experience in public utility work would do likewise.

Q. Why would you do that?

A. Because they were not proper elements of value in a rate case.

Q. Suppose the books show in a rate case that the company had carried an account, in other words, every time the city paved a street in which the company have a main, you found that the company, every time that was done, would credit itself so much by reason of the fact that that street was paved and you were going to value this investment and came across an account of that kind, would you consider it?

A. As a book entry I would have to exclude it.

Q. Why?

A. Because the company has not incurred an expense and I am analyzing the records of expenditures.

Q. In arriving at your valuation of the investment you would have to exclude that?

A. I would, because my valuation as shown in my report is based upon book records.

Q. If you were valuing the property for rate making purposes, whether it is by this method or by the reproduction method, or any other method, would you consider, Mr. Haganah, that the company was entitled to have added to the physical cost of the property claims for extras on account of mains under pavements where mains were laid in advance of the pavement or at the time?

A. If I followed the reasoning of the court in the Consolidated Gas case, of course I would have to include the paving.

Defendants move to strike the answer as not responsive.

1822 Q. Now, Mr. Witness, just consider the reproduction method or the one which you have advanced in answering that question.

Complainant interposes the same objection last above made.

A. I must begin my answer—you are assuming a condition—if I am to reproduce this property——

The MASTER: You answered that question once.

A. Under my own method I excluded it, because I am dealing with actual cost as shown on the company's books.

Q. Isn't it your thought Mr. Haganah, and has it not been your policy wherever you have made, in rate making cases, where you have considered the reproduction method or the method you have advanced in this case, to exclude in all cases any items or claimed items on account of mains and services being under the pavement?

A. I never used the actual reproduction value of the property in a rate case; I always supplemented it with the cost data from the company's books.

Q. In your report to the city of Chicago, I will ask you if you did not treat the subject in this manner; Although strongly argued by the Company, no allowance has been made in the above total to cover the value of the pavement over the company's distribution system. It was claimed that since the valuation for the purpose of this investigation must be the reproduction cost, the company should be given credit for the value of the street pavement over all of its mains and services, even though the company paid no part of the cost of such pavement, since if the plant were to be reproduced as of this date it would be necessary to cut through such pavement for the purpose of laying the pipe. The fact- show that on
1823 many of the streets the mains were put down before any pavement was laid by the city and in many other streets the mains were laid at a time when the city was replacing the pavement, so that in either case the company was put to no expense because of the street improvement. You stated that in your report, did you?

A. Substantially so.

Q. And you further stated: The purpose throughout the appraisal of the distribution system was to allow a valuation where the

company incurred pavement expenditures and to exclude any allowance for pavement laid and paid for by the city. The pavement over the company's present distribution system of which the street mains alone are nearly 2,600 miles in length is reasonably worth $6,000,000, but this is the investment of the people of Chicago and not the investment of the Gas Company. Even if the reproduction theory is to be carried to the utmost extent, it does not follow that the same distribution arrangement would be followed and that the same number of pipes would be placed in the streets as they exist at present. It is probable that much of the distribution system would be placed in alleys and part ways where the construction expense would be very much reduced. If under the decisions of the courts the above amount, together with the additional reproduction cost of cutting through all the pavement, must be allowed in the valuation, the investment value and the interest requirement will be very much increased. In the leading utility rate cases the court has failed to hold specifically that the value of the pavement over the mains not paid for by the company must be included in the plant values. In all such cases the paving item was very large, and if it were intended to include it in the valuation, it is reason-
1824 able to assume that the courts would have so stated. On the other hand to exclude such pavement valuation has received the endorsement of the federal court and public service commisisons. Every legitimate expenditure in adapting the utility to the demands of progress and community growth is a proper charge to construction, and as such the investment therefor is entitled to participate in the distribution of earnings from operation. If expenditures for pavement are incurred by the utility in response to assessments levied by the city, or are incurred in cutting through the pavement for construction purposes, these are proper capital charges. It does not seem reasonable, however, that a utility should be permitted to capitalize expenses for municipal betterments in which it has not participated, and when the benefits which accrue to it are remote and incidental. To do so would be to compel the customers for utility service to pay increased rates because of their civic progressiveness. For the above reason the city's expenditure for paving the streets over the company's distribution system is not regarded as a gas company investment in rate adjustment proceedings; regardless of the value which may exist in a commercial sense because of such improvements. To include the cost of cutting through such an amount of paving and its subsequent replacement would seem to be carrying the reproduction cost theory further than justice warrants. Did you state that in your report to the sub-committee of the city of Chicago?

A. That in substance. I believe you have read my report correctly.

The MASTER: We are losing sight of one proposition and that is this is not a rate making court.

Mr. BRENNAN: This is a report to the council of the city of

Chicago. We have this thought in mind: There are certain
1825 witnesses introduced by the complainant in this case claiming this valuation must be predicated upon certain items. Here is another witness who has a different notion about it. When we come to discuss it we will find there is more or less inconsistency.

The MASTER: That matter on the question of rate making would not have very much weight as to the question involved here.

Mr. BRENNAN: Only in so far as the questions in dispute may enhance or decrease the value of the property of the complainany company.

The MASTER: There must be kept in mind that the Supreme Court of the United States has held that this court is not sitting as a rate making court. The only question this court has to settle is whether or not it is confiscatory.

Q. You do not find anywhere any record or any credit to the capital account for these pavements, do you?

A. You mean charge to the capital account?

Q. Yes.

A. No, sir.

Q. You do not find anything?

A. Not for expenditures not actually incurred in paving by the company.

Q. What do you find the cost value of the property now including the working capital?

A. $2,056,106.65.

Q. Where is that shown?

The MASTER: That is adding the working capital?

A. That is adding the working capital as shown in the last column of schedule 1 Exhibit B of my report.

Q. That is $128,000 for working capital?

A. Yes, sir.

1826 Mr. BRENNAN: I believe that is all, subject to recall.

Redirect examination by Mr. GUERNSEY:

Q. Before I forget it, Mr. Hagenah, you stated that in making these adjustments which you refer to, you had eliminated certain items from the cost of the property shown by the company's books?

A. Yes, sir.

Q. Now in making these adjustments I wish you would state whether you added any items?

A. No, sir; I do not recall any.

Q. So that the only change in this property account that you have made was to subtract from it?

A. Yes, sir.

The MASTER: What you call the replacement account there?

A. That is in the operating expenses; not included in the construction.

The MASTER: What you deducted for replacement is not in the total?

A. No, sir, not in the total.

The MASTER: That would be about $10,000?

A. That does not belong in the total.

Q. Now, Mr. Hagenah, you were asked very early in the cross examination whether your employment by the city of Chicago had not terminated and you said it had; I wish you would state the circumstances which led to the termination.

A. In short, my report was displeasing to the administration which succeeded to the administration under which I was employed.

The city desired me to turn over all my working sheets and
1827 data and records and all material which I had compiled during the course of my work on that case, for the purpose of criticism and review by other parties. This material had been given to me under a contract which was as binding as I felt any contract could be, and I could not violate that contract, and rather than to break the contract on my part I gave the city of Chicago my resignation.

Q. It was a question then of keeping your word or keeping your job?

A. And between the two I kept my word.

Q. Now, Mr. Hagenah who was employed to succeed you and to criticise your report, by the city of Chicago?

A. Mr. Bemis.

Q. Is he the gentleman sitting back of Mr. Brennan and making suggestions while he is cross examining you about this report?

A. Yes.

Q. Now, referring to this conversation with Mr. MacVicar, was the audit which you have made of the books of the Des Moines Gas Company two years prior to that time or about two months prior to that time?

A. About two months prior to that time. It was the first work I ever did for the Des Moines Gas Company.

Q. I wish you would explain some of the reasons why in connection with the sinking fund created to take care of depreciation, rates of interest are taken that are lower than the rates of interest that are taken at the same time as a basis of a return?

A. The depreciation rate is computed on a sinking fund basis, having a relatively low rate of interest. This fund must be invested by the company and only a comparatively small part of it is ever available for investment and that cannot be invested for a relatively long time; so that the disposition of these funds must be
1828 governed by the rules and conditions which affect the investment market rather than conditions surrounding an industrial or speculative basis. The rates governing in the investment market are quite well defined and vary in different parts of the United States from four to five and a fraction per cent. The rate ordinarily used in computing a return for the sinking fund plan in depreciation allowance is four per cent. The rate to which a company is entitled on its investment is necessarily a much higher rate, because it is the earnings from a business in actual operation and is therefore entitled to the same rate of return which a business operat-

ing under similar conditions of risk would be entitled to earn. The gas business is subject to risks and the investments there are for an uncertain time. There is no assurance that the money will ever be returned. There is no collateral to secure your investment and to a large degree it is beyond your own control. These conditions in the money market demand a relatively higher rate of return.

Q. Please state whether so far as you know it is the universal practice to take for your sinking fund rate of interest a rate that is lower than the rates talked about as rates of return?

A. As far as I know that is the practice.

Q. Now you were asked whether this investment valuation which you have made and which is set out in the final form in Exhibit 26, if my recollection is correct, and in a tentative form in Exhibit 25 and 23, took any account of appreciation on account of pavement over the mains; I wish you would state whether this valuation takes into account appreciation in the value of real estate that may have been purchased thirty or forty years ago?

A. It does not; it shows only the cost of real estate pur-
1829 chased at that time which in many instances is many years ago.

Q. In other words, what I want to get at is the reason why you did not refer to appreciation on account of these various matters is because it is investment that is the underlying idea in this computation which you have made?

A. It is; cost as shown by the books is the underlying idea rather than the value.

Q. Now, you have a good many times during your examination and cross examination referred to actual cost and actual investment and cost as shown by the books; I wish you would state generally whether throughout your examination or not, you have used these expressions as meaning cost as shown by the books without including what we have called the overhead items?

A. I mean by these several terms costs as shown on the books of the company.

The MASTER: That would not include interest actually paid?

A. No, sir; unless they charge it on their books to the construction account to which I find no charges.

Q. Taking up the other items, how about engineering, taxes, contingencies and things like that?

A. There are no charges for those on the books that I found.

Q. So that they are not included in this $1,928,016?

A. No, sir; to my best recollection all the taxes charged to operating expenses and the salaries of officers, even while they devoted their time to construction work were all charged to operating expenses and no part went into the construction account.

The MASTER: Then they would appear in the operating expenses?

A. They would, in the operating expenses.

Q. Now you referred to a payment of ten thousand dollars made during the year 1910 on account of services furnished to the
1830 Des Moines Gas Company by persons who were also in the employ of the United Gas Improvement Company and you mentioned as two matters that were included in services of this

kind, engineering and auditing and were then interrupted and did not finish your answer. Can you state any other matters that are included?

A. Another service probably more valuable than either of those two is the financial assistance this company receives from the United Gas Improvement Company.

The MASTER: He has already said that.

Mr. GUERNSEY: Yes, but the question stands on cross examination as if it was omitted.

A. The United Gas Improvement Company affords to this company its own credit and assistance in the way of furnishing bonds and ready cash.

Q. How about the purchase of materials and supplies?

A. The benefit is very material through the purchase of supplies in large quantities through the Philadelphia office and charging this company with the cost of its proportion of the larger purchase.

Q. In what way was this payment of $10,000 made?

A. That was paid in the form of salaries to four or five individuals who are themselves connected with the United Gas Improvement Company for services which they rendered to this company.

Objected to on part of defendants as not the best evidence and for that reason they move to strike the answer.

Mr. GUERNSEY: Do you really mean that?

Mr. BRENNAN: I really mean that the check which he says was paid to these people is not the best evidence.

Mr. GUERNSEY: He did not say check. At the very outset
1831 we were not to bring the books in here; I understood counsel to say they did not want us to do that.

Mr. BRENNAN: I am objecting to that part of it as not the best evidence.

Mr. GUERNSEY: Do you want us to bring the books in; do you waive our having the books to show these items here, while we are talking about these items?

Mr. BRENNAN: We object to this witness testifying as to the manner in which this $10,000 is paid, if he has testified from the books.

The MASTER: They have already waived that. This other matter is a different problem altogether. It is understood he is testifying from the books.

Q. You have no personal knowledge of these matters, have you?

A. Not at all.

Q. Now, then, Mr. Hagenah, to go back, you stated as I understand it, the books show these payments aggregating $10,000 in the year 1910 were made to certain persons in the form of salaries who were at that time officers or employés of the United Gas Improvement Company. Will you please state whether as shown *shown* by the books it appeared that these same persons were at the same time officers or employés of the Des Moines Gas Company?

Defendants interpose the same objection.

Mr. BYERS: It seems to me that is a waste of time; that item will

be fully explained by some person on behalf of the company before we get through here.

Mr. GUERNSEY: I do not see why counsel object to my asking the witness what he knows about it.

The MASTER: Answer the question.

A. I think they are.

1832 Q. Referring to complainant's Exhibit 27, I will ask you to state whether at the request of the complainant you have taken the expenditures of this company as shown by the books and the present value of the property as shown by the testimony of the witnesses Baehr, Lea and Randolph, and the average of the present value as shown by these witnesses and attempted to reconcile the differences?

A. I did.

Q. And is this Exhibit 27 the sheet which you have prepared to show this reconciliation?

A. This typewritten copy of the original which I prepared I believe is correct as to typewriting.

Q. Now then will you explain to the Master just how you made this up and what these differences are and what have caused these differences?

A. The first column in this exhibit agrees with the footings in schedule 1 Exhibit B with the single exception that for the purpose of this table I have combined the total in the column headed "extensions and improvements" and the total column headed "street lamp extensions"—I beg your pardon; the combination has been of two columns entitled "services and street lamp extensions." The amount for extensions and improvements is as per my report. The total agrees with my report to which I add the $128,000, making a total of $2,056,016.65 as the cost of the property plus working capital at the close of 1910 as shown by the books.

Q. Pardon my interruption. In this first column following $2,056,016.65 you have three items, paving, overhead and indirect charges and going value which appear blank in that first column?

1833 A. They are blank because there is nothing on the books which I have been able to find showing paving not paid for by the company, over head and indirect charges and going value as these terms are used in the engineers' reports for which I am trying to compare book figures. In the second column I take the sum total shown by the company's books and make certain distribution of these items to show more nearly the cost of the property opposite to the titles shown at the left hand of the page. This is done because the land in my report is included in the general title extensions and improvements and for the further reason that the item which we discussed yesterday amount to $285,000 covered every class of property. I distributed that total over the different columns in so far as I could do it with the degree of accuracy which I could obtain from requests of those who were supposed to know and in talking with the engineers who had valued the property included in that item. That gives me the same total to which I again add the

working capital and receive the same total as in the first column. The next three columns show the valuation of the property in its present condition as of January 1st, 1910, made by engineers Baehr, Lea and Randolph. To their totals of the physical property I have added their estimated working capital and show on the following line their total of the physical plant plus the working capital. They show in their appraisals the item of pavement over mains and certain indirect and overhead charges and estimated going value. The item overhead and indirect charges I could not take out from the major classifications of property because they were so involved and connected with the cost of the property that it would have
1834 necessitated going through every item as detailed in their report to make that separation. The allowance for indirect and overhead expenses with the exception of a small amount in Mr. Lea's report is therefore included in the major classifications above. Their going value is shown here as shown in their report and on the last line their totals. I have then averaged the three appraisals and the corresponding valuations appear in the next column of figures. This column I have compared with the second column in Exhibit 1 which shows the book cost as redistributed to absorb the $285,000 single charge of the company's books and find there are differences which appear in the last column under the heading "excess of present value over book cost." The first item shows that the average of present value from the reports of the three engineers exceeds the book cost by $188,145.74.

Q. What item is that?

A. That shows the difference in the appraisal as opposed to the book cost of the real estate.

Q. Under the heading of remarks opposite that item, what have you in the way of explanation?

A. Under that heading I tried to explain this difference. In this case it is my opinion that the difference represents the increment or appreciation in the value of the real estate as opposed to the book cost and the indirect charges which the engineers added to the value of the real estate.

Q. Now take the next item?

A. The second item shows—that includes buildings, equipment, machinery, holders, oil tanks etc., under the heading of extensions and improvements. I see in referring to this column the stenographer has omitted the minus sign in two or three places
1835 where the book value exceeds the present value placed on the property by the engineers.

Q. In those instances does the average present value exceed or is it less than the book value, as you call it?

A. With respect to extensions and improvements the book cost is greater than the present value of the property as appraised by the engineers and shown in the average of their three appraisals, it is larger than this average by $68,854.20. There should precede this figure a minus sign omitted by the stenographer.

Q. Will you tell us, so that Mr. Brennan and myself can straighten these out what minus signs you put in there?

A. I put a minus sign before the $68,854.20 and also before the item, $6,776.93; and also before the item $25,226.60 all in the same column.

Q. Now will you proceed—you had just started on this item of $68,854.20 which is the amount which the book costs of the extensions and improvement exceeds the average present value or cost of reproducing the physical property given by the engineers.

A. The engineers' reports show the present value and the book figures show the cost new to the company. The difference therefore represents the allowance for depreciation as compared to the book cost.

Q. Let me ask you what do you include by extensions and improvements here?

A. The buildings, machinery and equipment, holders, oil tanks, and in general the apparatus at the works.

Q. Recurring to this item $68,854.20 which takes up what depreciation was allowed if there were increased in the prices of
1836 commodity and labor and things that go into the costs of these various matters that are included in extensions and improvements, how is that taken care of?

A. That will be shown through the appraised value by the engineers. They are appraising the property on a reproduction new basis and a reproduction present value basis, and if there has been any appreciation in commodity prices for wages, it would appear in their valuation and not in the book figure.

Q. And in the same way if there were depreciation, that would appear in these figures and would affect the amount of this $68,854.20, which would be attributable to the depreciation.

A. It would take into consideration depreciation and appreciation neither of which the books cover.

Q. That is what I wanted to bring out—this may not check with their depreciation account because they may have taken either higher or lower construction costs of these items.

A. There must also be considered in connection with this the overhead and indirect expenses which are included in these figures by the engineers.

Q. Now, take the next item, street mains, what is the situation?

A. Comparing the book figures with the average of the three engineers' present value I find their figures exceed the book figures by $135,207.34. This item on the books covers the cost of laying the mains and the material and the cost of whatever pavement the company cut through to replace. The difference must be accounted for by the increase in commodity price and the increase in labor since the time the mains were laid and the charges therefor appear on the company's books and also shows an increase because of the engineers having included indirect and overhead charges in their appraisals.

1837 Q. Now the next item, meters, what is the situation as to that?

A. A comparison of the average of the three engineers present value with the book figure for matters shows that the present value

of the engineers is less than the book figure by $6,776.93. This shows the depreciation on the meters which the engineers have allowed, but they have added to the cost their usual allowance for overhead and indirect expenses.

Q. So that this would not equal the total depreciation allowed?

A. It does not.

Q. In the matter of services, what is the situation?

A. A similar comparison shows that the present value placed upon the services by the engineers, using their average, is less than the book cost of these services by $25,226.60, which is again explained by the element of depreciation which the engineers allowed and the charge for overhead and indirect expenses which they include in their appraisals.

Q. Now, going to the next line headed total, what do the figures $222,495.35 indicate?

A. That is the total excess of the average present value of the property taken from the three engineers' reports and compared with the total book cost shown in my report and again on this exhibit amounting to $1,928,016.65.

Q. What is the next item?

A. To the engineers appraised value I have added the estimated working capital and that average is shown in the sixth column. The difference between that average, working capital, and the amount as I computed it from the balance sheet is $22,282. and that represents the difference of opinion which existed between the engineers and myself as to working capital, and it also shows the element
1838 of danger which exists in taking working capital solely from the balance sheet as of a specific date, for the inventory account may be abnormally low at that time and the items current assets and liabilities may be such as to show an unfair condition to be assumed as an average for the year. My figure is $22,282. less than the average of the engineers.

Q. To put it in another way, your figure eliminates judgment and theirs does not?

A. Exactly. I base mine entirely on the balance sheet as of a given date in this case at the end of the business of 1910.

Q. Of course this business is like every other business, the items you took into account vary from time to time, the bills receivable, cash on hand and things like that?

A. They do fluctuate. I have added these two items which show the total excess of the engineers average from the book figures $344,777.35 their average as compared with the total I gave a few moments ago the cost of the physical plant plus working capital, $2,203,302.

Q. Let me ask you, this $244,777.35, what is the fact whether that is the difference between the total column of the average present value and the total of your first two columns which is the total in the sum as expenditures as shown by the books $2,056,016.65.

A. It is. The next three items show the average allowance by *by* the three engineers for paving and overhead and indirect charges and going value. Not any of these items appear on the company's

books. Consequently there is no figure with which to compare the item $22,674. and is not to be given the greatest consideration because it is an average of a single item from one report and rep-
1839 resents by no means all the expenses of that report.

Q. You mean this item of $68,023.

A. Yes, sir.

Q. That was overhead and indirect charges as you could segregate from the other items in Mr. Lea's report?

A. Yes, sir.

Q. You divided that by three and obtained $22,674.

A. Yes, sir.

Q. What is the $2,203,302.

A. That is the average of the engineer's present value of the physical property, plus working capital and allowance for paving and the average of the overhead and indirect charge and the going value.

Q. How did you get these columns to balance, how do we find out whether they balance or not?

A. The figures are taken from the engineers reports.

Q. I don't think you understood me. Do you balance by adding the sum of the last column excess present value over the book costs and the book cost shown in the first two columns to see whether that sum equals the total of the column of average present value?

A. To prove my total I deduct the amount shown in the total for the second column which is the figure on the company's books, from the average of the three engineers' figures $3,203,302, giving me an excess $1,146,285.35 shown in the last column which is also the total of the plus and minus signs in that last column.

Mr. GUERNSEY: The complainant now offers in evidence Exhibit 23, identified in connection with the examination of this
1840 witness.

Mr. BYERS: The defendants object to it as incompetent, immaterial and not sufficiently identified as to the items it purports to contain.

Complainant offers in evidence Exhibit 24, identified in connection with the examination of this witness.

Objected to on part of defendants for the same reasons last above stated.

Complainant offers in evidence Exhibit 25, identified in connection with the examination of this witness, this exhibit being the third tentative calculation, if I correctly recall the number, of the investment value by this witness.

The defendants interpose the same objection and add to the objections to Exhibit 23 and 24 the further objection that the Exhibits are merely conclusions of the witness, taken from the records and figures which have not been included in evidence, nor sufficiently identified.

Mr. GUERNSEY: That gets us right back to the original proposition whether you want us to bring the books over.

Mr. BYERS: We don't want you to bring the books over. This objection does not raise the question of the books being here at all. It is an entirely different thing.

Mr. GUERNSEY: Do you make a question that the books from which these statements were taken have not been identified as the books of the Gas Company?

Mr. BYERS: No, sir.

1841 Complainant offers in evidence Exhibit 26, it being the final calculation by this witness of the investment value of the plant of the complainant.

The defendant interposes the same objection last above made.

The complainant also offers in evidence Exhibit 27, which is the reconciliation of the expenditures as shown by the books, with the testimony as to the average present value which has been introduced by the complainant.

The defendant interposes the same objection as last above made.

The MASTER: I am afraid that is a little misleading.

Mr. GUERNSEY: I do not object to changing my description of it. That is what we called it in our discussion. That is simply the name of this paper.

At this time an adjournment was taken until 1:30 p. m.

1842 1:30 p. m. TUESDAY, *August* 8, 1911.

W. J. HAGENAH being continued on redirect examination by N. T. Guernsey, Esq., testified as follows:

Q. Mr. Hangenah, before I forget it, on your direct examination what you said with -eference to the matter of discount on securities may not be entirely clear, there may be some misapprehension about it. I wish you would state whether the books of the company take into account any items as part of the cost arising out of discount on securities.

A. My answer to that question was not clear and may lead to a wrong impression. There are charges to construction on account of discount on bonds.

Q. And where tho-e charges appeared do you eliminate them or recognize them as part of the cost?

A. I recognize them as part of the construction cost.

COURT: Do you remember what the amount of it was?

A. Not exactly, but in round numbers I think it was about $75,000. I am not sure as to that.

COURT: That was reckoned as part of the cost of construction?

A. Cost of construction, cost of getting money for the construction.

Q. I see a memorandum of another matter here that I think I might as well refer to at this time. You refer to Exhibit "B" Schedule 1, and name various items that were included in the first column headed extension improvements.

A. Yes, sir.

Q. Where did office furniture and fixtures appear?

1843 A. They are included in that column.

Q. Referring to schedule 5 where you make some adjurtments on account of construction items and depreciation as I understood you, you in answering one question referring to this amount

$7,351.92 gave that amount and then set against it there should have been a depreciation allowance. Now what depreciation allowance did you refer to as something against this $7,351.92 or the depreciation allowance which you estimated here as a necessary operating expense?

A. That bring- up the question which the Master asked this morning and I don't think it was properly explained. He asked the question in connection with another page of my report. What I meant was that taking the year 1910 I eliminated from the operating expenses for the purposes of schedule 5, the sum of $7,351.92, this amount contained $6,087.17 which represented replacement expenditures and $1,264.75 which represented capital charges. The replacement charges are excluded from the operating expenses because I added to the operating expenses an amount estimated to cover the requirements for depreciation. Since this item which represents replacement charges that year is really a part of and is included in the term depreciation if I had not excluded it, it would have amounted to a much larger charge for depreciation equal to the amount shown in Schedule 5, plus the $6,087. What I did was to make an adjustment there by reducing operating expenses by the amount improperly charged and adding to it the amount which should be charged to cover the estimated depreciation, both that covered by actual replacements, and the deferred maintenance for that year. As against the other number of $1,264.75, that might properly be charged to the construction account for that year
1844 because I have thrown it out of the operating expense, to be entirely accurate in that I should have charged to the total $1,928,000 this sum of $1,264.75 which I called improper operating expenses. For the three years over which I made that analysis the difference to the construction account because of this adjustment would be slightly in excess of $2,000.

COURT: Aside from that in your total operating expenses are included all charges and taxes and special taxes?

A. Yes, sir.

COURT: And interest?

A. Yes, sir.

COURT: And material?

A. Yes, sir.

COURT: But fixed charges are not included?

A. They are not included as operating expenses, but they are deducted before arriving at the profit and loss for the year.

Q. In your report Exhibit 23, in Schedule 2, and the exhibits which are attached to it, I think you have the statements of the operating expenses without taxes or depreciation for the year ending September 30, 1898, the year ending September 30, 1909 and the year ending September 30, 1910. Now I wish you would look at Exhibit No. 28 and state whether or not that shows a summary of the detail matters that I have referred to that are contained in your report and also the average for these three annual periods?

A. Yes, it does show the totals from my report for the year 1908 1909, and 1910.

Q. I think I made a mistake in describing this, that is I excluded taxes, it includes taxes and excludes depreciation I think?

1845 A. That is it.

Q. Now this gives not only the total operating and the total revenue and the difference for each of the three years, but also it averages the three years?

A. Yes, sir.

Q. And this is in effect a summary of these other more detailed statements?

A. Yes, sir.

Mr. GUERNSEY: We offer this Exhibit No. 28 in evidence in connection with the examination of this witness.

Defendants object to the offer for all the reasons urged to the offer of the other exhibits.

Q. Calling your attention to Exhibit No. 25, that covers I believe a five year period showing operating expenses and the revenue commencing with the organization of the present company and including the year 1910?

A. It does.

Q. Referring to the paper that is marked Exhibit No. 29 I wish you would state what that is?

A. This table shows in a condensed form the gross earnings, operating expenses, taxes, depreciation, the total operating expenses which is the sum of the three preceding items, the net earnings the miscellaneous sales, and lastly the net return as computed in this manner available and applicable for interest and profits for the period since the organization of the Des Moines Gas Company to the close of the calendar year 1910 and shows also the average of these several periods for each of the items in the table.

Q. I think you testified during your direct examination that you had verified this exhibit 24. Have you checked Exhibit 29

1846 with Exhibit 24 so as to be able to tell us whether it is a correct summary of what appears in detail in Exhibit 24?

A. It is, and is correct except for such matters as typographical errors which might have crept into it in making a copy of it. The figures which it contains are copies for the totals in the different states as contained in Exhibit 24, which I did check against the books.

Q. In 1909, the year ending December 31, 1909, there is an item in red $107,783.26 opposite net earnings from sale of gas. How does that happen to be in red?

A. That shows a deficit on the books for the year in question because of the fact that the company made a charge for depreciation that year to the amount of $264,108.78. This is the only charge for depreciation during all the years covered by this table and since this depreciation over the entire period is charged against the single year it wipes out all the net earnings and leaves a deficit on the books

for that period of $107,783.28 as opposed to the net earnings for these years.

Q. Now what is this item miscellaneous sales, what does it cover?

A. That covers revenue which the company received from transactions other than the sale of gas and residuals.

Q. And what kind of stuff does the company sell aside from gas and residuals?

A. Such as stoves and lighting fixtures.

Q. What we call gas appliances?

A. Appliances, yes, and performed house fitting services and sell to its employés some very small amounts of coal and coke I believe which those employés may from time to time want for their own domestic use. It is a facility and convenience afforded its own employés.

1847 Q. And opposite this item in each column for each period there appears the result of those transactions for that period?

A. From these commercial or miscellaneous sales.

Q. Now what is the last column here, this last column appearsong on Exhibit 24?

A. The last column is computed for the years covered in Exhibit 24, for the major items in this condensed income account.

Q. And what is the average result there as shown in this period of these miscellaneous sales profit or loss and how much per annum?

A. It is a profit, a very insignificant amount compared with the other figures. The average for this period is only $203.86 profit.

Mr. GUERNSEY: We offer Exhibit 29.

Objected to as incompetent, irrelevant and immaterial.

Q. Referring to the paper, Exhibit 30. I will ask you to state whether that is a summary of the same period, but excluding Valley Junction?

A. It is.

Q. And what does this Exhibit No. 30 contain?

A. It contains a condensed income account showing the earnings for the city of Des Moines and the earnings in Valley Junction, the operating expenses in Des Moines, or rather for the Des Moines proportion of these gas transactions, and the valley Junction proportion, the net earningsm miscellaneous sales and net return applicable to interest and profits for the period since the organization of the Des Moines Gas Company, including and up to the end of the year 1910, and the average for each year covered in that period.

1848 Q. And what appears as the average net return from the plant in Des Moines applicable to interest and profits after the deduction of the Valley Junction business?

A. The net return applicable to interest and profits after deducting the Valley Junction proportion is $112,972.03. That is the average for that period.

Q. And — what basis is the deduction for Valley Junction made, in the first place I suppose there is a reduction from the receipts.

A. Yes, sir.

Q. Explain to the Master how you got at that?

A. The gas sold in Valley Junction sold at a different rate than in Des Moines, the rate is $1.50 per thousand. I deducted from the total earnings of the company the amount representing sales of gas in Valley Junction and multiplied by $1.50 per thousand to show the Valley Junction proportion of the gross earnings. I deducted from the operating expenses the cost of manufacturing, that is the amount of gas sold in Valley Junction at the cost of manufacture as shown in the city of Des Moines.

Mr. GUERNSEY: We offer in evidence this Exhibit just marked Exhibit No. 30.

To which offer the defendants interpose the same objection that was heretofore made.

Judge CARR: We have a couple of witnesses here on a different subject whose testimony I think will not be very long, and as it is difficult *from* them to be away from their business I would ask that this witness be allowed to step aside and we will put on that testimony now.

Mr. BRENNAN: We have no objections.

Witness excused.

JUDD & DETWEILER (INC.), PRINTERS, WASHINGTON, D. C., JULY 18, 1913.

Q. And where was that bank located?
A. In Eagle Grove, Iowa.
Q. Aside from your experience in the banking business in Des Moines in what other place have you been in the banking business?
A. In Webster City and Eagle Grove.
Q. So that your entire experience in connection with banks has been in Iowa?
A. Yes, sir.
Q. Now has your business experience been continuously in the banking business or were you for a time engaged in some other business or was the other business additional to your banking business, pelase explain that?
A. No, I have been continuously in the banking business.
Q. During the time you have been in the banking business, what official position, if any, did you hold for a time?
A. Either cashiership or presidency.
Q. That is of the banks?

Mr. BRENNAN: You want to show that he was formerly bank examiner, just ask him.

Q. Were you for a time bank examiner?
A. Yes, for six years in Iowa.
1851 Q. During what years was that?
A. During 1893, 1894, 1895, 1896, 1897, and 1898.
Q. Are you connected at the present time with any other business enterprise or financial institutions in the city of Des Moines?
A. Yes, sir.
Q. What?
A. I have an interest in the Brown-Camp Hardware Company.
Q. And in what business are they engaged?
A. In whoesale hardware, jobbing business.
Q. Any other business enterprise?
A. I own a little stock in the Warfield-Pratt-Howell Co.
Q. In what business are they engaged?
A. Wholesale grocery business.
Q. Any others?
A. In Des Moines, not that I can think of.
Q. What if any official position do you hold in the Central Life Insurance Company?
A. I have some stock in the Central Life and I am a director there and treasurer.
Q. That is a Des Moines institution?
A. Yes, sir.
Q. Now any others that you think of?
A. Not that I think of in Des Moines.
Q. Now in the conduct of your business as a banker, and your other business transactions, have you become advised as to the financial interests and become acquainted with financial men quite largely in the city of Des Moines?
A. I think I have.

Q. And have you among your depositors a good many
1852 business men and other financial men in the city of Des Moines?

A. Yes, sir.

Q. And what is the fact as to whether you frequently have one or more of your depositors conversing upon the subject of business interests and financial investments and to what extent are you consulted by your various depositors along these lines?

Objected to as irrelevant and immaterial.

A. Why yes, I am consulted quite frequently.

Q. Do you know what was an or about the 1st of January of this year in Des Moines the current rate of interest upon money invested in first class securities such as first mortgages upon Iowa real estate at not to exceed half their value?

A. Yes, sir.

Q. And do you also know what was the current rate of interest upon first mortgages upon city property where the improvements were taken into consideration?

A. Yes, sir.

Q. Now what was the current rate of interest upon such securities where the real estate consisted of farm lands and what was the current rate where the mortgage was upon city property?

A. What was the rate on farm property?

Q. Yes, farm lands.

A. First mortgages on Iowa farms were bringing around six per cent the first day of January, the first of the year.

Q. Now the balance of the question where the mortgage was upon city property?

A. Well from six, seven and eight per cent.

Q. That is where the mortgage was the first lien or first mortgage on city property.

A. Yes, sir.

1853 Q. Where the improvements were considered in the valuation?

A. Yes, sir.

Q. You say that was along about the 1st of January. Has there been any change in the current rate of interest up to the present time?

A. Yes, I think there has a trifle; in Iowa farm mortgages the rate is from five and a half to six today.

Q. You think on the Iowa farm mortgages the prevailing rate is not quite so high as the first day of January?

A. Between five and a half and six to day and six the first of the year.

Q. Has there been any other change that you have noticed?

A. No, sir.

Q. I will ask you whether a higher rate of return on money is expected and usually received where it is invested in business enterprises from what it would receive where the investment is in securities of the character that you have spoken of?

Objected to as incompetent, irrelevant, immaterial and asking for an opinion of this witness upon a matter entirely irrelevant, the question is incompetent in form.

A. Yes, sir.

Q. Now will you explain why that is if you know?

Same objection.

Q. That is why it is that investors expect and usually receive a higher rate of return where they invest their money in a business enterprise than they obtain where they loan it upon first class securities.

Same objection.

A. There is a greater hazard.

1854 Q. Now is it or is it not true that the greater the hazard the greater rate of return on money is expected and usually received.

Same objection.

A. The greater the hazard the higher rate is wanted, the higher the rate that is wanted.

Q. That is, it takes an expected higher rate to overcome an i-terest capital does it where the risk is greater?

A. Yes, sir.

Q. Now referring to business enterprises what effect does the degree of safety of the business enterprise as viewed by the investing public have upon the rate of return expected from money invested in such enterprises?

A. Do you mean by that a business that is less hazardous than others as to what would be expected?

Q. No, I am not asking for amounts now but asking what effect it has.

A. I answered that, that the greater the hazard, the higher the expectation, the higher the desires for returns.

Q. And is it true that a higher rate must be expected and usually received to overcome the inertia of capital to making investments in that particular business?

Objected to as incompetent.

A. Yes, sir.

Q. How are state and national banks looked upon by the investing public of Des Moines with respect to whether they are or are not safe business enterprises?

A. I think that they are regarded as very safe investments.

Q. Is it or it is not true that state and national banks are regarded by the investing public in Des Moines as being among the

1855 very safest of business enterprises?

A. I think so.

Q. Do you know of any business enterprise in Des Moines which is regarded by the investing public and people generally as safer business enterprises than state or national bank-?

A. I do not.

Q. Do you know what was the rate expected and usually received by the investing public upon money invested in state or national banks in the city of Des Moines on or about the 1st day of January of this year? That you may answer yes or no, whether you know that?

A. Why, yes, a general idea as to the other banks, I know what our bank has been doing.

Q. This calls for whether you know, yes or no.

A. In a general way I know.

Q. Now what was the rate of return expected and generally received upon such investments, that is investment now in state or national banks state or national bank stock not confining your rate of return expected necessarily to the dividends declared and paid upon stock but speaking of it in the nature of earnings whether distributed as dividends, held as undivided profits or placed in surplus?

Objected to as incompetent and immaterial.

A. What would be ex-ected?

Q. And generally received?

A. Well I think that the average investor in bank stocks would want to see it earn at least ten per cent.

COURT: Ten per cent over and above taxes?

A. Ten per cent net, earn ten per cent.

1856 Cross-examination by R. O. BRENNAN, Esq.:

Q. I don't suppose they would object if they should get 15 per cent?

A. I don't think they would. I have always found them that way.

Q. What would be the effect, Mr. Miller, if you had nut one bank in the city and that had no competition, would that relieve the hazard in any way?

A. No, I would not think that it would.

Q. The fact that you had no competition in the banking business in the city of a hundred thousand people, would that make it a more safe and stable investment than if you had sixteen or eighteen banks?

A. I don't think it would.

Q. Would you say the element of competition is not a hazard in any sense?

A. Well that is something that—that element we have never had in the banking business, I have not given it thought. I would think that if the bank was conducted on right lines that it would make no difference.

Q. Well take it in the great financial center, suppose you had one bank doing all the business, would the investment in that bank be safer than if there were probably fifty banks transacting business?

A. I think if we had the total deposits, the combined deposits of the city of Des Moines on our present capital stock that we could make more money. I believe, I feel quite sure we could.

Q. It would be a safer investment wouldn't it?

A. I think so.

1857 Q. It would relieve the hazard of competition which is an element isn't it that enters into business transactions and investments?

A. It would be same hazard in connection with our loans to make our loans safely but I think that the profit would be greater if we had all of the deposits to handle, that is if we could handle them all as carefully as we handle the one bank.

Q. Well I understood you to say that state and national banks were the safe investments of which you knew?

A. They have proved to be very safe investments in Des Moines.

Q. The regular rate of interest in Iowa is 6 per cent?

A. 8 per cent.

Q. 6 per cent is the legal rate?

A. Yes, sir.

Q. The current rate not to exceed 8?

A. Yes, sir.

Q. Contract rate, you can contract up to 8 per cent?

A. Yes, sir.

Q. Not above that and 6 per cent in the absence of anything in the contracts statijg the amount of interest it is 6 per cent?

A. Yes, sir.

Q. About the 1st of January, 1911, when you say farm mortgages were earning 6 per cent was that anything abnormal about that time of the year, or was that the ordinary and usual rate of interest which obtained say for the year preceding?

A. Well for the past two or three years rates of interest on farm mortgages have been ranging from five and a half to six per cent. Prior to that for a little time they were loaning at five per cent. Prior to that it was even higher, six, seven and eight per cent.

Q. That is going back about 1907?

1858 A. Oh no I mean quite a ways back. That is rates of interest on Iowa mortgages have gradually dropped from 8 per cent down to five and around two or three years ago raised to six and have been higher than that.

Q. There was a slight advance and then a slight decrease again so they are back now to five and a half?

A. Five and a half and six per cent.

Q. Where it is a five years' loan, five or ten year loan they usually ger it for 5 per cent don't they?

A. No, sir; You can't do that now that *that* I know of.

Q. Do you know of any mortgages being executed at five per cent on long term loans?

A. No, sir; I don't know.

Q. Five and a half you think?

A. Yes, sir.

Q. What hazards do you take into account in fixing the rate of return?

A. Well I regard a first mortgage on an Iowa farm well placed has absolutely no hazard whatever.

Q. And what hazards are involved in the other investments?
A. Well there is the usual business hazards.
Q. The other investments to which you have referred?
A. The usual business hazards.
Q. What are some of those?
A. Well investments without security and the credits that a merchant takes or makes without security in the sale of his goods, the rise and fall of his stock on hand.
Q. And his failure to get customers might have something to do with it?
A. Yes, sir.

1859 Q. Now suppose that you had an opportunity to make an investment in a certain business in a city of a hubdred thousand people where it involved furnishing a necessity where there was no competition that would make a pretty safe investment wouldn' it?
A. I would think so.
Q. About as good as the Iowa farm wouldn't it?
A. No, sir.
Q. What would be the difference?
A. The usual business hazards.
Q. The usual business hazards?
A. Yes, sir.
Q. That is the element of mismanagement, the element of the failure *ot* get customers, all those things you think would enter into the enterprise I have suggested?
A. Yes, sir.
Q. Where it was a necessity which people must have and where there is no competition?
A. Yes, sir.
Q. And you think that the element of risk and all that, the usual hazard of the usual business would enter in do you?
A. I took that into account did you say?
Q. (Question read.)
A. Yes, sir.
Q. Notwithstanding the article or commodity furnished was a necessity and that competition was eliminated?
A. Yes, sir.

Redirect examination by Hon. GEORGE H. CARR:

1860 Q. You were asked Mr. Miller, with regard to lack of hazard and your opinion with regard to it where the business was one where there was no competition. Now let me ask you supposing that you had a business like the gas company where there is no present competition in the sale of gas but it is a public utility subject to regulation as to the price of its commodity by the public, the property can at any time under the law be taken and condemned by the public, rival institutions may be at any time put in the field by the public, where no contract can be made that is binding for the price of the commodity for a length of time, where under the corporation law of the state the capital must all be paid up in money

when issued, a loan can only be placed for two third- of the capital stock, where the rate may be fixed today and changed tomorrow at the will of the rate making body, the town council, now taking all these matters into consideration and what would — say as to whether there is and would be in the mind of the investing public very great hazards and risk in that sort of business?

Objected to as incompetent, irrelevant, immaterial, leading and suggestive.

A. I would regard the hazard as a great one, yes.

Q. In that connection I will ask you whether there is any capital in Des Moines for investment in public utilities and especially in gas companies.

Objected to for the reasons heretofore urged.

A. It would be my opinion there would be very little money in Des Moines that would be available for that purpose.

Q. And why Mr. Miller?

A. Well there would be more opportunities, there would be opportunities for better investments in my judgment.

1861 Q. Is that because of these many risks and hazards that you have mentioned?

A. Yes, sir.

Recross-examination by R. O. BRENNAN, Esq.:

Q. Do you know of any stock being for sale in Des Moines, gas stock?

A. No, sir.

Q. Have you ever heard of any being offered for sale in Des Moines?

A. No, sir.

Q. Has there ever been an opportunity afforded to the investing public as far as you know to purchase gas stocks and especially the stock of the gas company?

A. No, sir.

Q. Gas stocks are regarded as pretty staple securities aren't they?

A. It would not be so considered by me in this city with this plant.

Q. Well I mean generally speaking over the country on the stock exchange?

Objected to as immaterial, unless confined to states where the state law is the same as it is in Iowa.

A. I would regard it as being an investment with the usual business hazard.

Q. Well you know what consolidated gas is worth on the stock exchange?

A. No, sir; I do not.

Q. Have you looked up the market to see?

A. No, sir.

Q. Have you informed yourself as to the market price of the stock of the consolidated gas company in New York?

A. No, sir.

1862 Q. Or any other gas stocks?

A. No, sir.

Q. Have you attempted to inform yourself on the subject?

A. No, sir.

Q. Or bonds of gas companies?

A. I would think the bonds were a safer proposition than the stock.

Q. Do you know anything about the bonds?

A. No, sir.

Q. About how staple they are on the market?

A. No, sir.

Q. You haven't informed yourself on that subject have you?

—. No, sir; I have not looked up the stock or bond market.

Q. Now what would you say about an investment in a railroad company, railroad stocks, does that appeal to you as being surrounded with a great many hazards?

A. Yes, sir.

Q. But railroad stocks are bought and sold every day are they not?

A. Yes, sir.

Q. Pass current?

A. Yes, sir.

Q. Regarded as very staple investments?

A. Not as staple as other investments that a person might be able to select.

Q. You can usually realize on them for collateral can't you?

A. Yes, sir.

Q. If I have railroad stock in the Northwestern I could go to your bank I presume and realize on them?

A. Yes, sir.

Q. Take the 60 cent stocks, do they usually run at par?

A. I could not answer that question, I do not know.

1863 Q. And what would you say as to five per cent bonds, are they sold at par?

A. Yes; a great many of them.

Q. Have you informed yourself as to railroad stocks and bonds as to whether they sell above or below par or at par?

A. I have noticed the quotations.

Q. And what have you observed in that respect?

A. I have observed the market all the way from a very low price to a good big price.

Q. I know generally, but take 6 per cent, six and five per cent bonds what is the general average on the market for that class of security?

A. Well a good five per cent bond of a railroad in good standing ought to sell at par.

Q. Well now an investor in a railroad company his investment has th- same element of hazard with regard to regulation as an investor in a gas works hasn't it?

A. Yes, sir.

Q. They sometimes undertake to regulate rates don't they?

A. Yes, but they are — government control.

Q. Under government control?

A. Yes, that is government regulation or attempted by government regulation.

Q. That only affects interstate commerce?

A. Interstate commerce propositions but the city gas plant here is under city control.

Q. But the railroad is not subject to regulation and control by the government except in so far as it is conducting an interstate business, isn't that true?

A. Yes, sir. Otherwise by the state.

1864 Q. So that the rate when it affects the shipper within the state and it is in the state business, then it is subject to state regulation and control?

A. I don't know any state railroad that their bonds would be regarded specially valuable.

Q. What I had in mind was that the railro-ds which you say furnish a reasonably good investment are subject not only to control by the government with -espect to their interstate business but they are also subject to control by ever- state through which their railroads may run, that is true isn't it?

A. Yes, sir.

Q. That at least have the semblance of regulation in the states going on from time to time?

A. Yes, sir.

Q. Now Mr. Miller, you think it is a great hazard that the state guarantees practically a monop-ly to an enterprise. Do you think that is in the nature of a hazard?

Objected to as incompetent, immaterial and so formed it cannot be intelligently answered and for the further reason that as to gas companies the statutes absolutely prohibit an exclusive franchise.

Q. I would like to know what you consider as hazards in connection with a public utility?

A. Your thought is——

Q. Here is a gas company in the city of Des Moines for instance that claims to have approximately 180 miles of mains, spread out all over the 54 miles of territory, and in all the principal streets and situated in the streets of the city so as ti make it practically impossible for a competing company to get in here, and with a natural growth and development of the city, having tho-e

1865 things in mind you would not be much afraid of competition would you?

Objected to as assuming a fact that is not so, to-wit, the fact that it would be practically impossible for a competing company to be authorized to do business in the city, contrary to any evidence introduced and contrary to the fact.

A. I would think that if the gas company had a monopoly of the business here that it would aid them in their business.

Q. So that some of the hazards you have been speaking about would be eliminated wouldn't they?

A. Not enough of them to suit me, to make an investment.
Q. That would have some of them out of the way right there?
A. Yes, I would think that would.
Q. Now you were asked about the right of the state to regulate the rates, suppose you knew and it is the law that the rate which is prescribed must be a reasonable rate, that is to say, you are entitled to have the operating expenses and taxes and depreciation, you have got a right to earn all that and over and above that a reasonable return and the courts stand ready and willing to enforce your rights in that respect, isn't that some safeguard to your investment?
A. Would that be a help to the investment?
Q. Some safeguard?
A. Well would they guarantee a certain profit?
Q. They guarantee that you shall earn a reasonable return, earn a profit.
A. That is that you could earn a reasonable profit?
Q. I say the courts stand ready to protect you to that extent.
A. I would think that was a help, yes.
1866 Q. That would eliminate some hazards wouldn't it?
A. It would depend on how much they required for a reasonable profit for the hazard on the investment.
Q. That distinguishes the public utility from the private enterprise?
A. Yes, sir.
Q. So in effect you are guaranteed a monopoly and guaranteed a reasonable return in this state, isn't that true?
A. No, I would not think so.
Q. You would *bot* think so?
A. No, sir; I don't believe there is any state or any nation that guarantees any return that I know of.
Q. Judge Carr has asked you if you would consider all these things as being hazards. The fact that the city may regulate rates and the fact that the city cannot enter into a contract fixing rates and all those things. Now did you consider these other features in connection with your answer?
A. I considered all the features that I had in mind in connection with a business of that kind.
COURT: What was your rate that you fixed for the gas company?
A. I didn't fix any, I was not asked that question.

Witness excused.

1867 SIMON CASADY being called on the part of the complainants and sworn and examined in chi-f by Hon. George H. Carr, testified as follows:

Q. Where do you live?
A. Des Moines, Iowa.
Q. How long have you lived in Des Moines?
A. All my life.
Q. And what is your age?
A. 58 last June, 16th day of June.

Q. In what business are you engaged?
A. I am engaged in the banking business.
Q. And with what bank are you associated or connected?
A. Central State Bank of Des Moines, Iowa.
Q. What is your position?
A. I am acting president.
Q. How long have you been in the banking business?
A. I have been in the business since 1877.
Q. And it necessarily follows all of that time in Des Moines?
A. Yes, sir; all that time in Des Moines.
Q. To what extent are you acquainted with the financial men and financial institutions not only in Des Moines, but over the state of Iowa generally, Mr. Casady?
A. Oh I have a general acquaintance with the financial situation.
Q. You have among your depositors and *and* have you had during all these years many of the business men of Des Moines who are engaged in manufacturing and mercantile lines and general classes of business?
A. Yes, sir.
Q. And have you become familiar with the view taken by
1868 investors as to what are desirable investments to a greater or less extent?
A. Yes, sir; to a greater or less extent I am somewhat familiar with that.
Q. Aside from your connection with the banking business, what other business enterprises are you connected with?
A. I am not connected with anny profit making enterprise outside of the banking business.
Q. Have you any association with any of the insurance companies of Des Moines?
A. I am treasurer of the Bankers Life Association.
Q. Give the Master in a few words something of the volume of the business of that company?
A. Well it is rather extensive, I think it is one of the very few large insurance companies, not so recognized, however, by old line companies, but one of the large insurance companies of the United States.
Q. About what is the volume of its invested capital?
A. About fifteen to sixteen millions.
Q. And you are treasurer of that institution?
A. Yes, sir.
Q. Do you know what was on or about the 1st of January of this year in Des Moines the correct rate of interest upon money invested in first class securities such as first mortgages upon Iowa real estate at not to exceed half their value?
A. Yes I think I don.
Q. What was the current rate of interest upon such securities where the real estate consisted of farm lands and what was the current rate where the mo-tgage was upon city property if there was any differenfe?
1869 A. On farm loans I think that the best loans offered will range from five and a half to six and a half, that is within

the last year or two years, I think about that time. And city property it would all be owing whether the rate was higher or lower whether it was residence property or business property. Residence property would bear a higher rate than active income bearing property on our best streets.

Q. About what would be the rates on that class of property?

A. I think the residence property would average from one to two per cent higher than farm loans and the best of income property down on our best streets would equal if not sometimes be a little lower than farm loans.

Q. Has there been any change that you have noticed in the current rates of interest since January 1st upon securities of the character we have been speaking of?

A. Not much. No, practically the same. If any thing a little trifle lower in farm loans.

Q. Farm loans alone?

A. Yes, sir.

Q. Is a higher rate of return upon money expected and usually received where it is invested in a business enterprise over what is received at interest in first class securities?

A. Yes, sir.

Q. Now why?

A. Well because there is no risk in one and there is some risk in the other.

Q. Where one has the opportunity of investing his money in securities of the character we have been talking about, is it regarded by the investing public that there is any particular risk or hazard?

1870 A. None in the farm loans or finest income business property. There is more or less hazard in the residence portion.

Q. That is due to what?

A. That is due to depreciation of the houses and sometimes the temporary quality and way they are built and sometimes the desirability of the location is changed and various things like that.

Q. What are some of the hazards that affect the investing public in Des Moines that makes them demand and receive a higher rate of return upon their money before they will invest in business enterprises than they would be willing to loan their money for upon such securities as you have been speaking of?

Objected to as incompetent, because based upon an assumption that is not in the record and no attempt made to put it in.

A. Money invested in business enterprises is not always in the control of the owner of the fund unless he is in active charge of the business, therefore it is more hazard to him, he has to trust to the judgment and ability of some other party. That is one of the hazards that to me is quite pronounced.

Q. Do you think of any other?

A. If a man has control of his own property he can place it where he thinks it is safe, he feels he is exercising his own judgment, has

a good deal less risk though he may himself make mistakes as well as others, but he feels that way and willing to take a lower rate of interest and chance his money.

Q. What effect does the degree of safety of the business enterprise, as viewed by the investing public, have upon the rate of return from money invested in business enterprises?

A. Oh it has a good deal of effect. A man that feels he is
1871 going to get a pretty good return, get better than the law allows him to loan money for will take some chances. That is the reason why we speculate in gold mines and we generally lose it all.

Q. As I understand you, to overcome the inertia of capital the investor takes into consideration the degree of safety in the investment and the rate is in accordance with his view of the degree of safety of the business enterprise in which he puts his money?

Objected to as incompetent and immaterial.

A. Yes, sir.

Q. How are state and national banks looked upon by the investing public of Des Moines in respect to whether they are or are not safe business enterprises?

A. I think that the average investor looks upon them as a reasonably safe proposition when properly officered and managed.

Q. Do you know of any business enterprise in the city of Des Moines which stands higher in the public estimate in this regard or which are regarded as affording a greater degree of safety than state and national *and* banks?

A. No, I think no. I do not.

Q. Do you know, Mr. Casady, what rate of return is expected and usually received by the investing public upon money invested in state or national banks in the city of Des Moines on or about the first day of January this year? That you may answer by yes or no.

A. Yes, I think I know what is to be expected.

Q. What was the rate of return expected and generally received upon such investments not confining the rate of return expected
necessarily to dividends declared and paid upon stock, but
1872 speaking of it in the sense of earnings, whether it would be in the form of dividends or held as undivided profits or places in surplus?

Objected to as incompetent and immaterial.

A. I think that an investor in bank stock would not be satisfied with less than 10 per cent. I am speaking now of its earning power.

Q. Net earning power?

A. Yes, when I use any rate I mean net.

Q. You say that is or was on or about the 1st of January the rate that was expected and generally received upon such investments?

Same objection.

A. I could say expected, but not received.

Q. Having in mind that one who had money to invest would loan his money in the class of securities that you have been speaking of, where there was little or no hazard, now to induce him to invest his money in any business where there is this hazard that you have spoken of requires this added rate of return to induce him to make such investment?

A. Yes, sir.

Q. Now what rate in your opinion, what rate of return would the investor have to see in it, expect I mean before he could be induced to invest his money in any business enterprise rather than to loan it out in such securities as you have spoken of or loan it upon such securities as you have spoken of?

Objected to as incompetent and immaterial.

A. If one engaged in business he expects a good deal larger return than any return that can possible be expected by any loan investment. It would be all owing in my judgment to the kind of business he was about to engage in whether wholesale gro-
1873 cer or manufacturing or some other purpose. If he would engage in a bank I think he would feel very satisfied and pleased to have it ten per cent and then as much more as the institution might earn. But in a manufactory I don't think that would satisfy him at all. It would not me.

Q. Will you explain to the Master why, whether it is on account of the degree of safety that enters in?

A. Certainly it is the degree of safety and control that he has over his money. If he had it in a manufacturing enterprise he would not be able to dispose of it if there should be any unfortunate conditions surrounding that investment. He can practically always dispose of bank stocks at some figure. He can't always sell manufacturing stocks.

Q. Do you — Mr. Casady how investors in Des Moines look upon investments in public utilities and as to whether there is money available for such investments and if so what rate of return?

Objected to as incompetent and immaterial.

A. I have had opportunity to enlist people in the city of Des Moines to invest in local public utilities and have not been successful.

Q. Just why?

Same objection.

A. Oh ofr many reasons, political and otherwise. The lack of control or practical lack of control of their own affairs, putting it in the hands of a set of men that are elected by this community to control these affairs and there are very few men that have the possession of a little money want to do that. They would rather keep control of it themselves at a much smaller rate of interest.

Q. To what extent, Mr. Casady, does the law in Iowa, re-
1874 fering more particular to the provisions of our laws preventing a corporation from loaning money to exceed two

thirds of its capital invested and the provision of our law that all capital issued by a corporation must be paid in full, the provision of our law to the effect that the city council are empowered to fix rates cannot make a contract which abridges in any way their right to change the rate at any time they see fit, the fact that the city council may at any time it sees fit make or change a rate, the fact that other enterprises of a like character may be authorized to operate in competition, the fact that the city may at any time it sees fit condemn the property, take it away from the owners, those and some other provisions that may occur to you, what effect do those provisions of the law have upon the investor in determining whether an investment in a public utility like a gas company is a hazardous investment?

Objected to as incompetent, immaterial and it ought to be at least assumed in a court of law that the laws are just and reasonable and ought not to be the subject of expert testimony to impeach them in any way.

A. It does not help him to get investors from the outside public.

Q. The question was what effect would that have on a man, local investor?

A. It has a bad effect. It does not help to get money to invest in these corporations.

Cross-examination by Hon. H. W. BYERS:

Q. Is it your idea that because the laws proceed on the theory that the managers of property shall deal honestly makes a hazard of the business?

1875 A. I don't get what you are at.

Q. A law that requires the capital stock to be paid up does that make a hazard to the business?

A. No, that is not a hazard to the business.

Q. You don't include that in your question?

A. He had so much there I said it didn't tend to induce people to put money into a business.

Q. A law like that is an insurance to good business isn't it?

A. Well I would not enter into a discussion of that because I am not opposed to men paying for their capital, not at all.

Q. Now leaving that because that is a subject that ought not to be brought up especially in a hearing of this kind, you have been an investor practically all of your manhood years?

A. Yes, sir.

Q. And your investments have been for yourself and for your friends and customers?

A. Yes, sir.

Q. And you have confined your investment opportunities as I understand it and as I know something about it, to banking securities largely?

A. To a great extent. I have invested in other things.

Q. But that has been the principal line of your operations.

A. Yes, banking and to real estate.

Q. And to Des Moines all of that time?
A. Practically all the time, some little outside.
Q. Now what would an investor have to pay for a share of bank stock in Des Moines that is netting ten per cent every year?
A. I am unable to answer you that question. I can give you quotations on bank stock, but I can't tell you what it would pay today because I don't know what they are all doing. I know what they would have to do in bank stock in my bank, if you want
1876 me to make it a personal matter I would do that.
Q. Very well, let's do that.
A. He would have to pay $200.
Q. You until very recently were in the Iowa National Bank as one of the managing officers?
A. Yes, sir.
Q. And that bank stock, do you remember what it was sold for on the market?
A. I left there about two and a half years ago and sold mine for 125.
Q. And what was it paying?
A. Paying 6 per cent.
Q. Six per cent per annum?
A. Yes, and earning more.
Q. It is true isn't it that farm loans are being made right now for as low as four and one half per cent?
A. Not to my knowledge. I pass upon possibe thirty or forty thousand a day and I have not made one short of five and a half for two years.
Q. Well you passed on one just the other day for Mr. Caldwell $24,000 loan for a section of Cass County land, do you remember that?
A. Yes, sir.
Q. Was that loan made?
A. Yes, I think so.
Q. Five and a half?
A. I can't tell you*b* the rate, but it bore so it would give the loan company five and a half. The investor now gets five and a half.
Q. The Bankers Life Insurance Company gets five and a half?
A. Yes, sir.
Q. What is the rate at which improvement certificates in
1877 the city of Des Moines are issued for?
A. They are issued for six per cent.
Q. No lower than that?
A. None that I know of.
Q. How did they sell on the market here?
A. All the way from two to four per cent discount.
Q. What is the usual rate upon the bonds issued by the city of Des Moines?
A. I am not familiar with that. I never made any bid upon any bond of the city of Des Moines or Polk county.
Q. They just recently sold an issue of bonds?

A. I think they went about four, four and fourth or four and a half.

Q. They bring a little premium at that figures?

A. That I know nothing about, I never deal in that kind of stuff.

Q. Mr. Brennan calls my attention to the fact that the city hall bonds drew four per cent and were sold at a premium, you don't remember that?

A. No, sir; I don't know anything about that.

Q. What is the usual rate for the use of money in Des Moines say now at this time or on the 1st of last January for short time loans?

A. In Des Moines I don't believe it has been less than six per cent, may have been some individual cases as low as five and some paper has been sold here by our merchants for less than that in the so-called commercial or note broker's hands. I am speaking of local banks now.

Q. I guess you didn't quite understand my question. What I wanted to know is what is the usual rate over the counter?

A. Six per cent.

1878 Q. For short time loans?

A. I said some few cases down as low as five.

Q. Those loans at six per cent over the counter, sho-t time loans, they average small do they not?

A. They will average all the way from a thousand to five thousand and higher.

Q. Wouldn't it be nearer right to say that they would average much smaller, I mean short time loans——

A. I am speaking of three and four months loans, nothing over four months.

Q. About what would they average in amount?

A. Oh I could not tell you that. We try to get fair size notes rather than little bits of ones.

Q. Rather than small ones?

A. Yes, sir.

Q. What is the usual rate, I mean over the counter at the banks for long time loans?

A. Do you mean loans on real estate.

Q. No, commercial loans.

A. What you call long time loans?

Q. Six months or a year?

A. Six per cent.

Q. If one of the business men of this city wanted to borrow $20,000 of your bank and would furnish you gilt edge paper to secure the loan, say for ninety days, what would you charge for it?

A. We would charge him today six per cent. We might for one or two cases as a favor loan to him at five or five and a half, but would not be anxious to do it.

Q. Isn't loans made as low as four?

1879 A. Yes, some three or three and three quarters, but not by ban-s in Des Moines, not to my knowledge. By the commercial brokers on the outside who live in Chicago or Kansas City or St. Louis who will come here to some of our big firsm and say to

them can't you use thirty or forty thousand dollars' worth of our money we will make you a rate of three and a half or three quarters or four per cent.

Q. That has been done quite frequently?

A. Done all the time. Then turn around immediately and try to sell us that same paper.

Q. There was such an occasion as that not very long ago representing a large transaction?

A. That takes place here possibly every thirty days in the year except maybe the fall.

Q. What is the lowest rate charged on a loan of that kind?

A. I think three and three quarters this summer. On top of that you must add a quarter for each renewal which makes it possibly four per cent for a year. Each time you renew that loan a quarter per cent brokerage makes it about four per cent each year.

Q. If I understood you correctly, but I don't care to take any more of the time than necessary, but if I understood you correctly you have a preference for bank stocks as investments?

A. No, I have not. I have a preference for stocks that will pay a good return.

Q. That I suppose would be true of everybody if they knew just which ones.

A. By the way some people act I don't think that is so.

Q. That may be true of a good many of us but I want to get at your reason if you can for saying that investments in state
1880 and national bank stocks are preferable. If I understood you you measure the sucurity of the investment largely by the kind of control, that is, if you have control of it yourself it makes a good deal of difference to you?

A. Yes, I like it a little bit betters.

Q. Now people who invest in bank stock don't have control of the business do they?

A. No, but they are deucedly careful where they shall invest.

Q. Banks are subject to the same hazards of management that any other business is?

A. That is very true, but they are careful. You can't sell all national banks and state bank stocks in this town on the same basis.

Q. Isn't this the reason why bank stock is preferable to investors here and that is because it pays a larger return than some other investments?

A. No, all of them don't.

Q. Well of course if they didn't then they are not all good investments?

A. Well I said to you that it required, the bank required individual handling.

Q. Isn't this the better way to put it to say investments in state and national banks, that the preference if there is any in the way of investments is stock whether it be banks or what it may be that have a good strong earning power and that earning continued throughout a period of years, isn't that the better way to put it?

A. Well that is all right a stock that carries a good earning power right along has its value.

Q. Now isn't that exactly the way investors determine the
1881 question as to the desirability of the investment by the earning power.

A. I would think so, yes.

Q. And the permanency of the period over which it will earn money?

A. Yes, sir.

Q. And as I take it you do not want to be understood as stating here that state and national bank stock- are any more desirable or any safer or any better than different stocks in other enterprises with the same earning power and the earning continued over substantially the same period.

A. Generally with a great many people who are seeking investments and relying upon someone to advise them I think that they would much prefer a bank stock if it was all right and properly conducted than they would a manufacturing or commercial enterprise such as a store.

Q. Of course it might be an enterprise subject entirely to changing conditions that any one——

A. Some that prefer that kind.

Q. Take all other enterprises with earning capacity which covers substantially long years and is as permanent as state and national banks, in all such cases, an investment there is just as good as a bank?

A. Well a great many people have to be shown in that respect, they would prefer a bank if everything else was equal and prefer a bank for a little less in earning power.

Q. That is because they have more confidence in a bank?

A. Possibly that is true. I am not able to say, but that is true I think.

Q. Take it here in the city of Des Moines for instance, you don't think that bank stock is any safer than stock in Younker
1882 Bros., do you?

A. Yes, I do. There is a great deal more earning power in Younker Bros. than in any bank in town.

Q. It depends on the earning power?

A. I say the earning power in Younker Bros. is much more than any bank in town and yet I prefer the bank and 90 per cent of investors who have a thousand or five hundred dollars or a few thousand dollars to invest prefer it.

Q. I have an impression from your testimony and what we all know about you, that you have a very distinct preference for investments along banking lines, that has been your life work?

A. I want to bring the idea to you there if I can make myself plain to you that a commercial house such as Younker Bros., is far more hazardous than any bank in the city of Des Moines.

Q. What makes it so?

A. Because of the change in style, caprice of the people who have to patronize the store in order to make profits there and all that sort

of thing. They may make a great big profit and they may make a very small profit, but they are very successful men.

Q. Then we get back to the proposition that the desirability of the bank investment is due to the fact that the rates that may be charged for money are very well fixed and settled, they are regula- and continuous and the business is carried on with little expense.

A. I don't think so. The expense is enormous.

Q. Well I expect that is so. The business of the bank, the rates are pretty well fixed, you can tell pretty well the first of the year about what you are going to have at the last of the year, taking the average——

A. No, we are always glad at the end of the six months that we have as good a six months and hoping the next six month-
1883 will be equally favorable. We can't tell because we don't know -hat we will do, we don't know what sort of condition we will run up against. Nobody saw what was to happen in 1907.

Q. Not absolutely, but you can take the last twenty five years of your bank life and run over it and it will average about the same year in and year out with a little steady upward tendency, isn't that so?

A. Well I will have to confess I have been extremely fortunate.

Q. The reason now why money turned out over the bank counter is a better investment than in some of these other enterprises, is because the return is more certain and more definite and more fixed, isn't that so?

A. Well it suits me I said and I think it is to a great lot of people who have a small amount of money to invest.

Q. So if you were called upon to advise a friend of yours with reference to an investment and would go and examine the property if it was an enterprise that engaged in manufacturing, or whatever it might be over a period of years, and if you could find that the output was regular and steady and that every year the fixed charges were about the same and the net earnings were increasing steadily every single year of the history of the enterprise, the upward tendency being a considerable per cent every year over the preceding year, that kind of investment would appeal to you wouldn't it just as a banking business?

A. Well I would want to know a little bit more than what you state. I like what you have stated very well, but I would want a little more than that, want to know what kind of a manufacturing plant it was and who was controlling it.

Q. What difference would it make if it was making money?

A. It might be once you got your money in you might not get it out.

1884 Q. Suppose they were making a commodity the demand for which constantly increased instead of diminished, and everybody will concede that, and the history of the plant itself will show that that has been true, then what would you say, wouldn't you say that it was pretty good stuff?

A. Well I guess I can understand what you are leading to, but if you would ask straight out what it was, I would advise them to keep

out of it, I would indeed. I never told a friend in my life to do that, advise my friends to keep away from it.

Q. You must remember you are just a witness here.

A. I know it, but I would advise it on that business.

Q. You are volunteering something wholly improper now.

A. I beg your pardon. I would rather you would ask me straight out so I would know the situation.

Q. No, we will proceed just as counsel and witness, and I am going to treat you right.

(Question read.)

A. I can't change my answer to that because I must know more definitely what the institution is, what it manufactures and what it is going to pay.

Q. Suppose it was the manufacture of soap?

A. Then I would have some doubts about it because I would not know *e*nough about soap and would want to investigate all the things entering into the manufacture of soap.

Q. If it had earned and returned a large per cent on the investment every year for twenty five years and the prospect for the future was equally as good as the past you would not regard that as of very great importance?

A. Yes, I would regard it as important, but would not invest in it without I knew the facts more in detail than you have
1885 stated and what the future control might possibly be.

Q. Suppose it was standard oil?

A. I would not touch it. I had an opportunity and would not touch it.

Q. You would not touch it at all?

A. I could have made money by doing it too, but I didn't touch it. I am glad you spoke about that because there is an actual case in my life.

Q. You are giving your answers entirely on likes and dislikes?

A. No, I may use the wrong word in giving these answers, but I would not advise it.

Q. You would have made a lot of money off of the standard stock?

A. I possibly would have made some money, but I don't advise it, I don't want it.

Q. One time you say the question of the desirability of the security is settled largely by its earning power and the regularity of the earnings. Now you say that there are some kinds of stock you would not to-ch at all even if the earnings were ever so large.

A. I think some stock I would not touch, I am speaking now more of the advice I might give people who ask me.

Q. The last six years do you know of any gas company stock that has been for sale in this town?

A. I can't answer you whether I have had any correspondence on that subject in six years or not, but I have had inquiry as to whether there was any market for gas or water or street railway stock in this town.

Q. In the last six years?

A. In the last six years, I don't recollect whether I had gas or not,

but I have had information upon these subjects, I suppose I
1886 have had about gas, but I can't tell you that.

Q. Do you know what the market value of gas stock is in Des Moines just now?

A. No, sir; I do not.

Q. To sum this whole matter up if I understand you the securities of the city of Des Moines, its bonds sell on the market for at least four per cent, its improvement certificates sell readily on the market for six per cent——

A. Those are not city of Des Moines six per cent, they are against the abutting property.

Q. They are improvement certificates?

A. They are against abutting property, that is the same as a tax none of us *bet* away from that.

Q. They go at about six per cent do they not?

A. Yes, with a little discount.

Q. And loans over the bank counter, short time loan*ds* go at six per cent?

A. Yes, sir.

Q. Loans for six months or nine months go about six per cent?

A. I don't know about nine months, don't make them.

Q. Well six months.

A. Four to six months.

Q. And farm loans five and a half to six?

A. Five and a half to six per cent.

Q. Depending on the size of the loan somewhat?

A. Size of the loan and quality of the farm.

Q. And brick business blocks in the business center of Des Moines carry loans at from four and a half to five and a half?

A. Not good brick blocks, but income bearing property I don't care whether it has anything on it or not, just — it is good in-
1887 come property.

Q. I mean that kind of property carries loans at four and a half to six per cent?

A. Yes, that is right.

Q. And money plentiful at that for that kind of security?

A. Yes, reasonably so.

Q. And commercial paper like the notes of the buisness concerns of Des Moines have sold within recent months and during recent years at as low as three and one half per cent.

A. You must add commission, that means four per cent, that is average four per cent.

Q. Residence properties carry loans in the market where they can be carried readily at from five and a half to seven per cent.

A. Six and a half to seven and a half.

Q. And that has been true for several years in Des Moines hasn't it?

A. I think so.

COURT: Let's see if I understand you. You don't advise investment in anything that is speculative?

A. None whatever.

COURT: Whether standard oil or anything else.

A. Whether standard oil, railroad stocks or anything of that character.

Q. You put railroad stocks in with standard oil too?

A. They are speculative pure and simple.

Q. Speculative, you mean by that they fluctuate in value constantly.

A. Yes, sir.

Q. Day in and day out and for that reason you call them speculative?

A. Yes, sir.

1888 Redirect examination by Hon. GEORGE H. CARR:

Q. You told General Byers to get any stock in your bank a man would have to pay $200 per share.

A. Yes, sir. I didn't mean to quote a price in this audience.

Q. Is that based on any assumed earning capacity of the bank? Or upon the actual earning capacity of your bank?

A. Actual earning capacity of the bank.

Q. The way the question was put there was an assumption of the earning capacity and your answer was based not upon the assumption of that capacity but on the earning power?

A. Earning power of that bank so far, yes.

Q. You were asked about the bonds of the city of Des Moines, some issue of bonds being placed at four or four and a half per cent. Do you know where that money came from that went in those bonds?

A. No, I do not.

Q. Do you know whether it came from the local market?

A. It did not come from Des Moines, came from the east I imagine, I don't know where.

Q. What is the fact, speaking generally, about rates of interest on money in the east as compared with rates of interest on money in Des Moines?

A. Oh very much less.

Q. You were asked as to whether there was any market for gas stock in Des Moines. I think you said you didn't know. Do you know of any market in Des Moines for the Des Moines Gas Company's stock?

A. No, I do not.

Q. There is no market htre that you know of?

1889 A. Not that I know of.

Q. You were asked as to advising a friend to make an investment. Suppose a friend should come to you for advice as to investing money would you advise such a friend to invest his money in a business enterprise instead of an investment of the money in securities of the character of which you have spoken, first mortgage loans on real estate unless the rate of return was materially higher than the rate of return that could be obtained upon the investment in the real estate security?

A. If it came from a widow or from a guardian, I would advise putting it in securities as a sure thing. If it came from some man a little inclined to speculate I would tell him to take a chance if he wanted to.

Q. Would you advise him to invest in a business enterprise at the same rate of interest he could invest in the securities?

A. No, sir; I would not.

Q. How much greater rate of interest would you have to see in the prospect before you would advise a friend to invest his money in a business enterprise.

Objected to as incompetent, not re-examination and immaterial.

A. If he had a very big clear return offered him and could take the chances on that I might advise him but I might hesitate under such circumstances?

Q. Yes, but how much would you have to see or know from your experience and knowledge over and above the return that he could receive upon the investment in the securities we have been talking about before you would advise him to invest it? Take the banking business for example which you recognize as among the very safest of business enterprises?

1890 A. I would not want to invest my money in a bank unless it paid me 10 per cent net with a prospect of more in addition.

Q. Would you advise a friend to invest in a bank unless there was good assurance of such a return rather than to invest his money in real estate securities?

A. I would.

Q. And how about the investing public?

A. The investing public I don't think -ant to take very much chance.

Q. And it would require that much then?

A. Yes, require a very material advance.

Q. To move money into that line of investment?

A. It would a very material advance.

Q. You have been asked placing municipal bonds or attempting to place municipal bonds in Des Moines. Do you know anything about the history of the effort to place telephone bonds in Des Moines?

A. I know something from hearsay about that. I never invested any. Quite a number of my friends did.

Q. And what is your information on the subject?

Objected to as incompetent and immaterial.

A. It was not satisfactory to those who invested in the bonds.

Q. You drew a comparison between some personal enterprise like Yonker Bros., and banks in your cross examination and you have stated that investors have to expect a return of at least ten per cent net on investments in banks and you have also stated that in your judgment the investing public looks upon banks as the safest of business enterprises or at least as safe as the safest. Now will you

tell the Master what in your judgment the investing public in Des Moines would have to expect in the way of a return upon in-
1891 vestments in a well conducted business enterprise of a commercial character or manufacturing enterprise.

Objected to as all gone over, a mere repetition.

Q. Would it or would it not be something in excess of the amount it would have to see in a bank investment or what would it be?

A. I would not think they would want to expect, I should think they would want to be assured of at least ten per cent.

Q. In any kind of business enterprise?

A. Yes, sir.

Q. That is to say before the investing public could be induced to put their money in a commercial or manufacturing enterprise they would have to see assurance of at least a ten per cent net return upon their money.

A. That is my judgment.

Q. You have already said something on the subject and I want to put this question to you, how does the investing public in the city of Des Moines look upon investment in public utilities in the city of Des Moines with respect to the desirability of such investments?

Objected to as incompetent, the witness is incompetent to testify what the public thinks about it.

A. I don't think they look upon them favorably at all. I think they rather avoid them.

Recross-examination by Hon. H. W. BYERS:

Q. You said Mr. Casday that your friends' experience in the telephone business was not entirely satisfactory. Some of them have had the same kind of experience with banks, haven't they?
1892 A. Oh sure, yes. Banks have not proven always successful.

Q. The only reason I inquire about it is to see if I can tell how you measure desirability of stock. You say your own stock you would not think of selling for less than $200 a share. Now what is its earning power, about in round numbers?

A. That was gone over pretty thoroughly at the legislature last winter. I am perfectly willing to answer. We have not earned less than 20 per cent for quite a number of years. I won't say whether any more or not, but we have not earned less than 20.

Q. That is evidently a very satisfactory investment?

A. Very satisfactory, yes. I am pleased with it and delighted.

Redirect examination by Hon. GEORGE H. CARR:

Q. You stated that the investing public in Des Moines did not look favorably upon investments in public utilities. I wish you would state to the Master why that is so.

Objected to as incompetent and immaterial.

COURT: I think you fully explained that. If there is anything else you want to say about it, you may add it.

A. I don't think of anything else.

Q. Nothing occurs to you to add to what you have already said?

A. I don't know of anything I can add except I don't like anything that I don't have some control over. I don't want to leave it in the hands of men living down there at the city hall much as I respect them as friends otherwise, I don't think they are fellows that handle my business as well as I can myself.

COURT: In other words you want to boss your own job?

A. Want to boss my own job and I don't think they know as much about it as I do if I am conceited about it.

Witness excused.

1893 W. J. HAGENAH being continued on redirect examination by N. T. Guernsey, Esq., testified as follows:

Q. Calling your attention to this paper marked Exhibit No. 31, I will ask you Mr. Hagenah, whether you have checked that so that you can say whether it is a correct statement of the working capital as shown by the books of the company on the 31st of December, 1910?

A. This table is taken from the balance sheet of the company at the end of 1910 and shows correctly the item of material and supplies, accounts receivable, cash, advance insurance and the item of accounts payable.

Q. Those are the items contained in the statement aside from the additions and subtractions?

A. Yes, sir.

Mr. GUERNSEY: We offer Exhibit No. 31.

Same objection.

Mr. GUERNSEY: I think that is all except we have three or four other exhibits that have not been sufficiently rechecked that I will recall Mr. Hagenah to offer.

Here the further hearing was adjourned until 9:30 A. M. tomorrow.

1894 Wednesday Morning Session.

AUG. 9, 1911—at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of complainant resumed as follows:

WILLIAM J. HAGENAH, re-called for further re-direct examination, examined by N. T. Guernsey, Esq., testified:

Q. Mr. Hagenah, I call your attention to the paper marked Complainant's Exhibit 32, and ask you whether that is a compilation showing the gas sales in Des Moines for the first six months of the current year as shown by the books of the Company?

A. It is; and it also shows the sales in Valley Junction for the same period.

Q. And these gas sales in Des Moines shown by that are divided in what way, or classified in what way?

A. They are classified to show the sales to general consumers through regular meters and prepaid meters as well as for public street lamps, private lamps and the amount used by the Company.

Q. Then what is there here in the way of comparison between the sales for each of the first six months this year and the sales for the corresponding months last year?

A. There is a comparison between the sales of the first six months of 1911 with each of the corresponding months in 1910, the column showing the increase in cubic feet and the per cent of increase for each month.

Q. Where the months do not happen to have the same number of days in each year, does that in any way affect the returns for *such* particular month?

A. It does not over a period of six months.

Q. It would for a single month?

1895 A. Yes, the meters might not be right for single days, but over a period it would be absolutely accurate.

Complainant offers Exhibit 32 in evidence. To this offer defendants make the same objection heretofore made to the other exhibits.

Q. I call your attention to the paper marked Complainant's Exhibit 33, and headed, "Statistical Date" and ask you whether you have checked this with the books of the company except as to population?

A. I have checked this statement with the books and records of the company, with the exception of the column showing population.

Q. And is it correct?

A. It is.

Complainant offers Exhibit 33 in evidence.

To this offer defendants make the same objection heretofore made to the other exhibits.

Q. I call your attention to the paper marked Exhibit 34, headed "Detailed Statement Gas Sold in Cubic Feet June 30, 1888, to December 31, 1910." Have you checked the total sales shown under the column headed "Totals" in this exhibit with the books of the Company?

A. I have.

Q. Are they correct?

A. They show the facts as they appear on the Company's books.

Q. You have not had time to check those other columns yet?

A. Not all of them.

Mr. GUERNSEY: Now I would like to ask counsel for the City whether they want to have those details checked or not. The totals have been checked and the items have not been checked.

Mr. BRENNAN: If the totals have been checked I suppose 1896 that is all we need at this time.

Mr. GUERNSEY: If you desire to have those other items checked, you let us know?

Mr. BRENNAN: Yes, sir.

Complainant offers Exhibit 34 in evidence. To this offer defendants make the same objection heretofore made to the other exhibits.

Q. Now, Exhibit 35, Mr. Hagenah, is a detailed statement, is it not, of facts with reference to meters that are summarized in one of these other statements which you have identified here?

A. Yes, sir.

The MASTER: The per cent of increase, what is that reckoned on?

A. The preceding year.

Q. This exhibit to which your attention is just called you believe to be correct?

A. Yes, sir.

Compainant offers Exhibit 35 in evidence. To this offer defendants make the same objection heretofore made to the other exhibits.

Q. Referring to the paper marked Exhibit 36, I wish you would state what that is, headed "Percentage Schedule."

A. That table contains an analysis in unit terms of the population, the amount of gas sales, the revenue and the operating expenses per meter per mile of main and per capita.

Q. Beginning when?

A. Covering the years from 1887 up to and including the year 1910. It shows the comparison of increase in the column of gas sales.

Q. Under population it shows two columns, first the population per meter for each year and then the population per mile of 1897 main for each year?

A. Yes, sir.

Q. What does M C. F. mean?

A. Number of thousand cubic feet.

Q. And under this general heading "Gas Sales" it shows in the first column the per cent of increase, in the next column the sales per capita, in the next column the sales per meter, and the next column the sales per mile of main?

A. Yes, sir.

Q. Then under revenue, it shows under the first column the revenue per thousand cubic feet for the year in question, the next column the revenue per meter, the next column the revenue per capita, the next column the revenue per mile of main?

A. Yes, sir.

Q. And under operating expenses it shows under the first column the burner cost per M C. F. What do you mean by burner cost?

A. That is the cost to the customer and is used to distinguish unit cost from the holder cost; I mean the cost to the customer, not the price.

Q. If I may put it in the language of a non-expert, does it mean the cost of the gas delivered at the burner where the customer uses it?

A. It does, but in this table it does not include all the expenses because the depreciation had not been added to the cost up to that time, which should be added.

Q. Well, the next item, headed "Per Meter" is the same cost for each meter?
A. Yes, sir.
Q. The next item is the same cost per capita?
A. Yes, sir.
1898 Q. And the next is the same cost per mile of main?
A. Yes, sir.

Complainant offers in evidence Exhibit 36. To this offer defendants make the same objection heretofore made to the other exhibits.

The MASTER: You included all expenses in this burner cost, I understand, except depreciation?
A. Yes, sir.
The MASTER: And that 1911, the burner cost of the gas is a little less than two-thirds of one dollar?
A. Yes, excluding depreciaation.
The MASTER: In other words, 66.47 *of* .6647.
A. Yes, sir.
The MASTER: That shows an increase over the previous year of nearly four per cent.
A. No, nearly four cents.
The MASTER: And over the year preceding that nearly seven cents?
A. Yes, sir.
The MASTER: And over the year preceding that, 1908, of nearly two cents?
A. Yes, sir.
The MASTER: A little over two cents.
A. Which year are you comparing now?
The MASTER: 1908.
A. Well, it is 2.4 over 1908.
The MASTER: That includes all the material used in the manufacture of gas, the labor and salaries?
A. Yes, sir, manufacturing and salaries.
1899 The MASTER: It does not include any interest?
A. No, sir; nor depreciation.
The MASTER: It includes taxes?
A. Yes, sir.
The MASTER: And includes the special tax of two per cent.
A. Yes, sir.
The MASTER: Everything in included except depreciation?
A. Everything except depreciation and the interest on the investment.

In connection with the examination of this witness we want to offer from the classification of gas accounts by the Public Service Commission, Second District in the State of New York, Section G281 on page 15, Section G282 on page 16, Section G283 on page 16, Section G284 on page 16, Section G285 on page 16, Section G286 on page 17, which sections are as follows:

Mr. GUERNSEY: If there is no objection I will hand the book to the reporter and let him copy the sections into the record instead of reading them at this time.

Mr. BYERS: What is the name of the book?

Mr. GUERNSEY: It is entitled "State of New York, Public Service Commission, Second District. Uniform System of Accounts for Gas Corporations. Adopted October 21, 1908." It purports to be published by authority of that Commission.

Defendants object to the offer as made as being incompetent, irrelevant and immaterial.

Mr. GUERNSEY: Do you object to the identification of the book?

Mr. BRENNAN: No.

The foregoing offer reads as follows:

1900 "G281. Engineering and Superintendence.

"Charge to this account all expenditures for services of engineers, draftsmen, and superintendents employed on preliminary and construction work, and all expenses incident to the work, when such disbursements cannot be assigned to specific construction.

NOTE.—When employees enumerated above are engaged in work not chargeable to construction, their pay and expenses shall be charged to the specific work on which engaged."

"G282. Law Expenditures During Construction.

"Charge to this account general expenditures of the following nature incurred in connection with the construction of a gas plant; namely, the pay and expenses of all counsel, solicitors, and attorneys, their clerks and attendents, and expenses of their offices; printing briefs, legal forms, testimony, reports, etc., payments to arbitrators for the settlement of disputed questions; costs of suit and payments of special fees, notarial fees, and witness fees; and expenses connected with taking depositions; also all legal and court expenses.

"When any of the expenditures above enumerated can be charged directly to the account for which incurred, they shall be so charged and not to this account. Expenditures in connection with the acquisition of the right of way or other land shall be charged to account No. G110, 'Land Devoted to Gas Operations.' Law expenditures in connection with the organization of the corporation shall be charged to account No. 101, 'Organization.'"

"G283. Injuries During Construction.

"Charge to this account all expenditures incident to injuries to persons when caused directly in connection with construction of gas plant and equipment; proportion of salaries and expenses of physicians and surgeons; nursing and hospital attendance, medical and surgical supplies, artificial limbs, railroad and carriage fares for conveying injured persons and attendants; funeral expenses (including payments to undertakers); proportion of pay and expenses of claim

adjusters and their clerks, and pay and expenses of employees and others called in consultation in relation to the adjustment of claims coming under this head; also witness fees and amount of final judgments."

1901 "G284. Taxes During Construction.

"Charge to this account all taxes and assessments levied and paid on property belonging to the corporation while under construction and before the plant is opened for commercial operation, except special taxes assessed for street and other improvements, such as grading, sewering, curbing, guttering, paving, sidewalks, etc., which shall be charged to the account to which the property benefited is charged."

"G285. Miscellaneous Construction Expenditures.

"Charge to this account the salaries and expenses of executive and general officers of a gas plant under construction; clerks in general offices engaged on construction accounts or work; rent and repair of general offices when rented, with the office expenses; insurance during construction; also all construction and equipment items of a special and incidental nature which cannot properly be charged to any other account in this classification.

NOTE A.—This account may include a suitable proportion of store expenses when such expenses are not assignable to specific materials.

NOTE B.—This account shall not include any costs of organization, or any costs or discount connected with the issue and disposal of stocks, funded debt, or other securities, and commercial paper."

"G286. Interest During Construction.

"Charge to this account the interest accrued upon all moneys (and credits available upon demand) acquired for use in connection with the construction and equipment of the property from the time of such acquisition until the construction is ready for use. Interest receivable accrued upon such moneys and credits shall be credited to this account. To this account shall also be credited discounts realized through prompt payment of bills for materials and supplies used in construction unless such discounts are credited to the particular bills."

1902 Complainant also offers in evidence from "Uniform Classification of Accounts for Gas Utilities prescribed by the Railroad Commission of Wisconsin, November, 1908, dated Madison, April, 1909," beginning on page 79 with the paragraph headed, "Miscellaneous Construction and Equipment Expenditures"; also the next paragraph headed "Salaries During Construction;" also the next paragraph on page 80, headed "Office Supplies and Expenses during Construction"; also the next paragraph on page 80, headed "Stationery and Printing During Construction"; also the final paragraph on page 80 and running over on page 81, headed

'Law Expenses During Construction;" also the paragraph on page 81, headed "Injuries and Damages During Construction;" also all the paragraphs on page 82, headed respectively, "Insurance During Construction," "Taxes During Construction," "Interest During Construction"; also the paragraph at the top of page 83, headed "Discount on Bonds During Construction"; also the paragraph on page 83 headed "Miscellaneous Expenditures During Construction."

Mr. GUERNSEY: We ask that the reporter copy this from the book instead of reading it here; it won't take so much time and it will be easier to get it accurate.

The defendants object to the offer as made as incompetent, immaterial, irrelvant to any issues in this case.

Mr. GUERNSEY: There is no objection as to the identification of the book?

Mr. BYERS: I guess the book is all right; I haven't seen it.

The foregoing offer reads as follows:

1903 "Miscellaneous Construction and Equipment Expenditures.

Accounts shall be opened as indicated below to which shall be charged all expenditures incurred during construction and before the operation of the gas utility, of the character indicated by the title of the accounts. If expenditures are incurred for the service of engineers, superintendents and other technical skill of an advisory character during the process of construction and such items are not chargeable to any of the following accounts, there may be opened the account engineering and superintendence.

The following detailed accounts should be kept of the expenditures during construction:

"Salaries During Construction.

Charge this account with the salaries of all general officers and general office assistants during the period of construction of the gas utility plant and up to the production and sale of gas.

"Office Supplies and Expenses During Construction.

Charge this account with the cost of all office supplies and expenses incurred during the process of construction of the plant up to the time of manufacture and sale of gas, such as messenger and janitor service, rent of premises occupied during construction, water, light, heat, telegrams, exchange on remittances, etc.

"Stationery and Printing During Construction.

Charge this account with the cost of all stationery, printing, postage, blanks, record books, etc., used during the construction of the plant and up to the time of manufacture and sale of gas.

"Law Expenses During Construction.

Charge to this account all law expenses incurred during the period of construction of the gas plant. Charge with the salaries and

expenses of counsel, solicitors and general attorneys, their clerks and attendants, etc., Charge also with the cost of law books, printing briefs, legal forms, testimony, reports, fees and retainers of the general counsel and attorneys, court costs and payments of specific notarial and witness fees, expense of taking deposition, and general law and court expenses during construction. Expenses of arbitrators of disputed points will also be charged to this account. When
1904 any of the expenditures above enumerated can be charged directly to the account for whose benefit they were incurred, they shall be so charged and not to this account. Thus, expenditures in connection with the acquisition of land to be occupied by the works shall be charged to the appropriate construction account. Law expenses in connection with the organization of the utility, whenever such can be definitely ascertained, shall be charged to the account organization.

"Injuries and Damages During Construction.

Charge to this account all damages to or destruction of property other than that owned by the utility, caused directly in connection with the construction of the gas works, and all expenses incident to injuries or death of employés and other persons for which injuries or death the utility is held liable or in the settlement of which claims allowances are made. This includes such items of expense as judgments for damages and plaintiff's court costs; proportion of salaries and expenses or fees of physicians and surgeons, expenses of undertaker, nurses and hospital expenses, medical and surgical supplies, contributions to hospitals during the period of construction of the plant, transportation of injured persons and wages and salaries paid to employés while disabled. The salaries and expenses of the utility's claim agents, adjusters and their assistants while engaged upon settling such claims arising during construction will be charged to this account. The compensations of the general solicitors or counsel of the utility while engaged in the defense and settlement of damage suits will also be charged to this account.

"Insurance During Construction.

Charge to this account all premiums paid to insurance companies for fire, casualty, boiler, fidelity and other insurance covering risks during construction of the gas works and its equipment.

"Taxes During Construction.

Charge to this account all taxes and assessments levied and paid on property belonging to the gas utility while under construction and before the plant has begun operations, except special assessments for street and other improvements, such as grading, curbing,
1905 paving, sidewalks, sewer, etc., which shall be charged to the account to which the property benefitted has been charged.

"Interest During Construction.

Charge to this account the interest accrued upon all money and claims payable upon demand acquired for use in connection with the construction and equipment of the gas works from the time of such acquisition until the works are ready for commercial use. Interest receivable accrued upon such moneys and claims shall be credited to this account.

"Discount on Bonds During Construction.

To this account may be charged the discount on bonds sold for construction purposes. The entries to such account shall be made with sufficient detail to permit of their identification and shall show the date when the bonds to which the discount applies were authoriezd, when issued and when sold, to whom sold, the amount realized from the sale, the purpose for which the bonds were sold, and the application of the proceeds; all of which details will be called for by the Railroad Commission.

"Miscellaneous Expenditures During Construction.

Charge to this account all expenditures incurred during construction not includible in any of the preceding accounts."

Mr. GUERNSEY: I think that is all of the re-direct.

Recross-examination by Mr. BRENNAN:

Q. Now, Mr. Hagenah, I want first to take up with you this morning a little more in detail with respect to your table shown at page 43 of Exhibit 23; I want to have a clearer understanding of your method of arriving at the value of this investment as illustrated by that table. Now the first figures in the left hand column 1906 purport to be the value of the plant at the beginning of the year; I presume that refers to the twelve months ending June 30th, 1887?

A. Yes, sir.

Q. Which you show to be $308,983.

A. Yes, sir.

Q. Now, as I understand it, Mr. Hagenah, the amount of $308,983 is the amount which you found on the books of the company which represented the value of the plant at that time?

A. Plus working capital at that time.

Q. That is what I wanted to know, whether in that $308,983. there is included therein anything as working capital and if so, please state how much?

A. The amount $308,983. included an allowance for working capital. The cost of the plant at the close of the period June 30, 1886, was $295,383 as shown in the last column in the table marked Schedule 1, Exhibit B in my report.

Mr. BYERS: That was at the end of the year 1886?

A. 1886. And the amount included in the $308,983 contains therefore the difference between that amount and the total cost of the plant at the end of 1886, showing an allowance for working capital to the amount of $13,600.

Q. That is $295,387.

A. $295,383.

Q. So then with respect to that item $308,983 includes $13,600 as working capital?

A. Yes, sir.

Q. And the $295,383 represents the actual value of the plant at the close of the year as shown by the books of the Company?

A. No, sir; it represents the cost of the plant at that time.

Q. The cost of the plant at that time and nothing else?

1907 A. No.

Q. Now, I wish you would explain to us just how you arrived at the $13,600 as working capital during that year.

A. That was obtained from the balance sheet of the company on June 30, 1886, and was determined from the analysis of the current assets and current liability items as of that date.

Q. Do you have that balance sheet set forth in your report Exhibit 23?

A. No, sir.

Q. Or in any schedules identified by you and offered as exhibits in this case?

A. I have not.

Q. Have you a copy of the balance sheet among any papers or memoranda?

A. No, sir.

Q. What book or ledger is that in, do you know?

A. For 1886.

Q. The ledger of the company for the year 1886?

A. Yes, sir; the ledger and the journal and cash books; the regular set of books of the company at that time.

Q. Could you have a copy of this balance sheet to which you have referred, at the opening of court this afternoon, Mr. Hagenah?

A. I don't know whether I can or not.

Q. If the company will furnish that for you, you will bring it in?

A. Yes.

Mr. READ: If the court please, the experts of the city have those books now and they can make copies if they desire to.

Mr. BYERS: The city is not furnishing proof in this case.

Mr. BRENNAN: We want the balance sheet, if your honor please, to check up on this question here of working capital, to ar-

1908 rive at his analysis of this item.

Mr. READ: It is contained in the books and you have the books in your possession. What do you want us to do, make a copy for you?

Mr. BYERS: Yes.

The MASTER: Of course, if they insist on it, they are entitled to have that balance sheet.

Mr. READ: The books can be brought in.

Mr. BYERS: We simply want a copy of the material he used in arriving at this working capital.

The MASTER: How large a thing is it?

A. Well it would take some time to prepare the balance sheet and go over the records.

The MASTER: I am talking about the one you have got this from.

A. It would take quite a little while.

The MASTER: Did you compile it?

A. I got the balance sheet as of that date from the Company's books.

The MASTER: The balance sheet you got from the Company's books, is that lengthy?

A. Yes, it would necessitate going over a good many accounts.

The MASTER: Either I don't understand the witness or he don't understand me. I understood him to say that he got a balance sheet; you made a balance sheet from the books?

A. I did not make the balance sheet myself; the records were shown to me and the trial balance and the balance sheet was verified to be correct with the books and from the trial balance and the books at that time I computed that the working capital was reasonably $13,600.

The MASTER: How large was the balance sheet?

A. As to the number of items it contained?

1909 The MASTER: Yes.

A. I don't suppose it contains over 12 or 14 items; though the details of those items before they are put into the balance sheet——

Mr. BRENNAN: We want this balance sheet.

Q. Turn to page three of your report and tell the Master whether this balance sheet you refer to is any more complicated than the copy which is used there?

A. No, it is not; but it is a good deal of work to prepare one.

Q. Didn't you have it?

A. Yes, I had it; but I haven't got it now.

Q. Where is it?

A. They have it.

Q. When did you turn it back to the Company?

A. When I completed my work.

Q. So that you returned this balance sheet to the Company as they had given it to you?

A. Certainly; all their records I turned back to them; they did not belong to me.

The MASTER: If you can make a copy of it readily, you may do so. If you can not, you might bring the books. The books as I understand it are in your possession, in the possession of your experts now.

Mr. BYERS: The books are in the office of the company and our experts are working on them there.

Mr. READ: Any book or record the Company has in its possession can be brought down here.

Mr. BRENNAN: Here is a witness in connection with the report made here. The company supplied him with a balance sheet for this year and he says he returned that to the Company.

1910 We are entitled to a copy of that balance sheet which was furnished to this witness.

The MASTER: Here is the idea: Under his calculation they want from this witness that balance sheet, if that can be readily gotten.

Mr. READ: They have been told that these records from which this witness got this information was in the books.

The MASTER: That may take a long while. Of course this table is made up figuring the value of this plant. It is not a reproduction method at all and does not approximate it. As I understand it, it is figuring eight per cent interest including depreciation from the time it starts until *the* it closes at eight per cent.

Mr. BRENNAN: And including losses at eight per cent.

The MASTER: Yes, sir. In other words, it gives them a new capital every year and they get eight per cent on that original investment exclusive of depreciation; that is what it amounts to. It amounts to giving them eight per cent compound interest upon the original capital and keeping that capital whole from start to finish.

The WITNESS: You are right, with the addition that the capital so increased is reduced by the surplus profits over and above eight per cent.

The MASTER: I am talking about the net.

Mr. BYERS: You can see how important it is to have every memoranda the witness used.

Mr. BRENNAN: We want to serve notice that we shall not excuse this witness until we are furnished a copy of that balance sheet.

The MASTER: Yes, under his theory that is pretty important.

1911 Mr. READ: I thought the matter was closed some time ago; if it can be found, we will produce it.

Q. Now, Mr. Hagenah, then the item to which I have called your attention $308,983 you say is the cost of the plant at that date plus the working capital?

A. Yes, sir.

Q. Why were you so careful to correct me when I was using the word value of the plant and say it represented cost?

A. Value and cost are two entirely different things.

Q. Then why in this table do you use the word value in lieu of cost; you say, value of plant at the beginning of the year?

A. That may probably not be the very best word for the beginning of the account; I never thought of it in that particular sense.

The MASTER: You mean book value?

A. Yes, the proper figure there is really cost. The word value is used as determined from the ledger entry.

Q. Was there anything out of the way with my designation of the value of the property at that date plus working capital?

A. Using the word value alone is not exactly right; if you had said book value, it would have been correct.

Q. Did you use book value in this report?

A. I did not put that head in; it would have been correct to put it in.

Q. Let me ask you this: Is the amount, namely, $295,383 is that the book value of this plant at that time as shown by the books of the company?

A. It is not.

Q. Then what is it?

A. That is the cost of the plant at that time.

Q. I said book value of this property at that time?

1912 A. It is not; it is the cost of the property at that time. I have eliminated the elements——

The MASTER: He says book value all the time.

A. He is asking if it is book value; it is not. It is the cost; the book value was more than I have here.

Q. Let us see; It is not the book value of the property then plus working capital, or $308,983.

A. No, sir, it is the cost of the plant, plus working capital.

Q. The actual construction cost of the property, plus working capital as shown by the company's books?

A. Yes, sir.

Q. Then you must substitute in that column there, instead of heading it value of the plant beginning of the year, you should say the cost of the plant at the beginning of the year.

A. Yes, that would be more nearly correct. The heading for the table is not technically correct. It is book cost plus working capital.

Q. Now, let us go to the next item, eight per cent on value of plant to-wit, $24,719, just how do you figure eight per cent interest; upon the $308,983?

A. Yes, sir.

Q. So that you are charging eight per cent interest on the book cost of the property and eight per cent interest on the working capital?

A. Yes, sir.

Q. That is your theory?

A. Yes, sir.

Q. There is no question about that now?

A. Yes, sir; using the word value in the sense I have just explained.

Q. You carry that same theory all the way through, do you?

1913 A. Yes, sir.

Q. Down to and including the year 1910?

A. Yes, sir.

Q. Now, in the next column, additions to plant including working capital, now does that mean the book cost of the additions to the plant?

A. It does.

Q. Plus working capital?

A. Yes, sir.

Q. Now, how do you arrive at the amount of working capital which is contained in that item?

A. I explain that in this manner: I analyzed and had assistants in the analysis of the current assets and liability items for all the years from 1887 to 1910. To take the working capital entirely from the balance sheet is open to criticism, as I explained yesterday, because the balance sheet at a particular date may not be typical of the company's condition through the year. The stock account may be abnormally low at that time; the cash account or balance may be very low or high. The amount of bills and accounts receivable and payable may be entirely abnormal, either too high or too low, and for that reason the balance sheet taken at any one particular date only shows the condition of the plant on that one date and is not necessarily typical of the company's condition throughout the year. In making this analysis for this series of years I found that the working capital some years increased substantially and some years very little; there were instances when there were actual decreases; whenever there was a decrease, the year or two following showed a very large increase.

Because of these elements being variable and fluctuating with
1914 the condition of the company in its operation. In order to take the individual items of increase and decrease of the working capital for each year, which would only complicate the table and not change the result materially, I took the average increase in working capital from year to year, which would bring me at the end of my table in 1910 to the amount of working capital as shown by their balance sheet and my analysis at the close of 1910. I then added this average increase of working capital to the actual increase in the cost of the property, that is additions to the plant during the year, and that average increase in the working capital added each year to the additions to the physical property amounted, as I recall it, to $5,000.

Q. Now, Mr. Hagenah, I want to take up, at the beginning of this first row of figures additions to the plant including working capital which you say is the book cost and you had the record to show what these additions were. You say you examined them and you were able then, were you not, to tell from the balance sheet of that year about how much was necessary as working capital from year to year, you had everything there?

A. I could determine that.

Q. That is what I want you to tell us. How much of that $1,894. represents the book cost of additions to the plant and how much represents working capital?

A. I will explain the statement that in one table of working capital the depreciation is at the rate of two and three-fourths per cent at which the working capital is computed at an average increase of $5,500. In another table where the depreciation is computed at two and a half per cent it is $5,000; which table do you have there?

1915 Mr. BYERS: I have the table here which provides for depreciation at two and a half per cent.

Q. It is $18,394. on two and a half per cent?

A. Now if you will refer to schedule 1, Exhibit B, of my report you will find the cost of the additions to physical property in 1887 is shown in the last column on that page and is $13,393.52. Now if you will add to that which represents the cost of the additions to the physical plant the average increase in working capital over this period of years it will give you $18,393.52 throughout this table.

Q. I am speaking now of the working capital that was actually used that year?

A. I have not used an actual working capital that year. I explained that by saying that I used an average increase over 23 years.

Q. So you took the working capital, that is you averaged it up and spread it over the 23 years?

A. Yes, sir.

Q. And then you added to the book cost of construction—and then it is your theory that on that increase, that the stockholder in addition to earning eight per cent on the actual book cost of the property, he is entitled to earn eight per cent on this working capital as well?

A. I think he is entitled to his return on the working capital investment as well as the physical property.

Q. Notwithstanding that, in order to evolve this method, you are required now to go back and strike an average over a series of years?

A. Yes, sir.

Q. And that is true with respect to your depreciation account. In other words you found no record that the company had

1916 charged off anything for depreciation?

A. I did find they had.

Q. Except the year 1910, is that true?

A. No, sir.

Q. When did they first open an account for depreciation?

A. They had no permanent account on their books for depreciation. They made a charge to profit and loss and credited the construction account amounting to, as I recall, $264,000.

Q. I have that in mind: I want to know how if prior to that item you found any record or account kept by this company to represent depreciation?

A. I don't recall any.

Q. Would you have thought there was one?

A. I would always look for one; I didn't find any in this case.

Q. You didn't find one, and none had been kept and you took it upon yourself to substitute something which the company did not carry in connection with their business?

A. In order to arrive at this fair value I had to compute in so far as I could with the material at my disposal, what I felt was a fair rate for depreciation, there having been no charge for it, so I added that amount.

Q. I say you went back to 1887 and averaged it up and fixed up their depreciation account that would coincide with this theory?

A. Not necessarily coincide with the theory.
Q. The company had nothing as far as you could see?
A. No, sir.
Q. Do you know what the company may have done in that respect prior to 1887?
A. No, sir.
Q. Would that be important to know?
1917 A. It would be interesting and would have some element of importance. But not of material important-; I can see where it might have some bearing, but not very materially.
Q. Why not?
A. Because the plant at that time was very small.
Q. How long had it been in operation?
A. I don't know.
Q. Did you take the trouble to find out?
A. I don't know how many years the company was operating prior to 1886.
Q. I notice in your report to the sub-committee of the council of the city of Chicago you were very solicitous to set forth an historical page in your report?
A. I did.
Q. You regarded it as important in that inquiry, did you not?
A. Yes, sir.
Q. But in this case you think it is not important?
A. I treated the historical question in Chicago in an entirely different way; the situation is not analagous at all.
Q. If this company had been in existence, say 20 years prior to the time you start in this report, and you had no records as to how the depreciation had been taken care of, would you assume that none had been carried?
A. I wouldn't assume anything if I had no records. I began my analysis with the earliest records of the company, furnished me in response to my request, and that shows the plant value as shown by my analysis, the plant cost of the books $295,283.
Q. In order to get at this plant value and in order to average a reasonable amount for depreciation suppose you wanted to find what that would be, say in 1910, what it should have been, or in
1918 1909, how many years would you have to go back in order to verify your theory and to find out what the rate should be?
A. I wouldn't have to go back very far to find what the rate for depreciation should be; that has very little to do with the present age of the plant.
Q. The amount you allowed for that purpose, that is, independent of the present age?
A. The rate is calculated to reproduce the plant as today and the rate is applied on the cost new of the property.
Q. You were not concerned in the years 1887 up to 1906, were you?
A. For the purpose of this table I was very much.
Q. Why?
A. It was necessary to compile this table.

Q. Why was it necessary in order to compile this table you should go back to 1887, for instance?

A. I don't see how I could find out the earnings and operating expenses and costs for the early years without going back to those years.

Q. That forms an important part in the making of this table then?

A. Certainly.

Q. If you had valuable information prior to 1887, it would be equally as important that you had that information?

A. Certainly; if I had information for the earlier years I would have used it. I asked for it and I found the books were not available. But it diminishes as you go back, because the plant is always growing smaller each year.

Q. You start out with an arbitrary figure showing the plant value at $308,983.

A. No, sir; that is a book figure; there is nothing arbitrary about that.

1919 Q. Now, we get up to eight per cent, additions to the plant, including working capital for six months, and that amounts to $736 I believe?

A. I have not the same table you have. I haven't a copy of that exhibit here. (Witness refers to table.) Yes, $736.

Q. Now that would be four per cent on the $18,394, representing the book value of the additions to the plant including working capital.

A. Yes, for the period of six months as opposed to a year.

Q. The interest on additions to the working capital, that is still carried into the other account on which the stockholder is entitled to a return on the investment?

A. Yes, sir; he is entitled to a return on the investment at the moment it is made.

Q. The next item, operating expenses, $51,753. Now can you analyze that item and tell us how you arrived at that amount?

A. That is taken from the company's ledger for that year.

Q. Can you tell the Master just what items are included as operating expenses for that year?

A. It includes charges under the general division of manufacture and distribution, commercial and general expenses; the manufacturing expenses include the cost of the boiler and generator fuel, oil, purifying material, labor at the works, and the maintenance, both labor and material items at the works. The distribution accounts include labor and the expense of superintending and operating the distribution system and the expense of material incurred and consumed in such operation and both the labor and material expense in maintaining the distribution system, constituting the mains, services and meters, and the commercial expense such as salaries,

1920 demonstrators, solicitors, advertisements and would generally include meter readers, the delivery of bills and would verge closely in with the general expenses of the operating salaries in the office, except that the company then was small and I doubt whether they had a general office. That would also include salaries of general officers and expenses of rent, insurance and taxes.

Q. Did you endeavor to check each of those items of the detailed information which went to make up the operating expenses?

A. Those items appear in the closing entries of a journal and the ledger for the different accounts.

Q. Upon that you say the stockholder is also entitled to earn eight per cent and that is added to these other figures?

A. It is, in the theory of the preparation of this table; as an abstract proposition that would not be so.

Q. But you did for the purpose of this table, in arriving — what you term the value of the investment, you do have the stockholder earning eight per cent per annum upon $51,753. representing operating expenses?

A. There is no column in this table to show eight per cent on the operating expenses; I just added the operating expenses; not eight per cent on the operating expenses.

Q. Now, then depreciation at two per cent on depreciable property $5,997. that is arrived at in what way?

A. By taking a rate of two per cent on the depreciable property included in the cost of the plant; that is, the items embraced in the first column.

Q. This $5,997. what did you do with that?

A. I considered that operating expenses.

Q. Is that carried into the same total?

A. It is carried into the table that appears in the next column.

1921 Q. This total of $410,582.

A. Yes, sir.

Q. Now then that $410,582, represents the book value?

A. Book cost.

Q. All right, book cost. At the end of the year of June 30, 1887, plus working capital, $24,719, eight per cent on the value of the plant including working capital, is that right?

A. Using value as I have explained it in connection with this table.

Q. You used value in Exhibit 26?

A. The word value is there but the title is not technically correct.

Q. And plus $18,394, representing the book cost or additions to working capital, and plus eight per cent interest on the book cost additions to plant including working capital for six months, and plus operating expenses, plus $5,997 for depreciation, you have a total of $410,582.

A. Yes, sir.

Q. From which now you deduct the gross earnings and then you say that the book cost of the plant at the close of the year was $331,789.

A. No, it was not the book cost now. It now becomes the investment value of the plant at the end of that year.

Q. What is the distinction or difference, if any, between the book value of the plant at that time and the value of the investment; I wish you would make that clear.

A. The book value contained elements which I did not think were proper amounts to be included in arriving at the book cost of

the property. The book cost was considerably lower than the book value. I had used book cost. That amount represents actual cash expenditure by the company for the property devoted to the public use in the gas utility. The value of the investment now
1922 under the theory of this table means that the amount $331,789, which is larger than $308,983, at the beginning of the year, includes the book cost of the physical property the working capital and the element representing the losses which the company has sustained on the operations of that year by reason of its failure to earn eight per cent in the operation of its business.

Q. So that you would add to the items which I have included in the general question, where we get the total of $410,582, the losses?

A. The loss is not determined until you consider the earnings of the business.

Q. You deduct the gross earnings?

A. Yes, sir.

Q. And then if the company has fallen below eight per cent that you capitalize and add that in and that is the value of your investment?

A. Yes, sir.

Q. Then you take that along the same way year after year and follow it out along the same way?

A. Yes, sir; wherever the company fails to earn eight per cent, the amount by which it fails I consider an addition to the cost; the amount by which it earns over eight per cent I use to wipe out earlier losses the investment has sustained.

Q. Did you prepare a table on a six per cent basis?

A. I did not.

Q. If you had made one and used six per cent instead of eight it would have made considerable difference in the computation?

A. Yes, sir.

Q. If you had used ten per cent you would have gotten considerable of an increase?

1923 A. A very much larger figure.

The MASTER: The total gain in what you term the value of the plant or investment value of the plant as I figure it during the 24 years is $1,080,125?

A. That depends upon the table you are using.

The MASTER: I was wondering whether one-fourth of that gain would represent the difference between that and six per cent.

A. I don't know that.

The MASTER: I don't either.

Mr. BYERS: What exhibit did your honor read the figures from?

The MASTER: I used the figures, his book value without any interest is $1,928,000, added to it $108,000 gives you $2,056,016. That subtracted from the total gives you the gain. I just wondered if one-fourth represented the difference between that and six per cent compound interest to date.

Q. Will you refer to exhibit 36 that you have had there?

A. Yes, sir.

Q. Now we take up the operating expenses without depreciation; I see for 12 month- ended December 31, 1910, the cost of producing gas at the burner is .6647; is that right?

A. Yes.

Q. Now, have you gone over these operating expenses pretty thoroughly for that year and the four years preceding?

A. Yes, sir; I went over them for 1910 myself; and for the few years preceding my assistants went over them and I checked their analysis.

Q. You know what it has cost the company in fact for operating expenses, from an analysis of the books?

A. Yes, sir; I have seen all the vouchers charged during that year.

1924 Q. I notice in the year 1909, the next year just preceding, the cost of manufacturing gas and delivering it to the burner was .6256?

A. Yes, sir.

Q. For ten month- which is computed on the unit basis?

A. Yes, which would not make any difference.

Q. If we take the 12 month- ended December 31, 1910, and deduct from the operating expenses the $10,000 that I believe you said was charged to operating expense and was paid to the United Gas Improvement Company——

A. Paid to certain officials of the United Gas Improvement Company who were officials of this company.

Q. Suppose we take that item from the operating expenses, and suppose we deduct also, I think it was $5,600, that was charged to operating expenses, representing litigation, and then we deduct $2,000 from operating expenses for donations to the Greater Des Moines Committee, and we have then $17,600 to be deducted from the operating expenses for that year; and I wish you would tell us, making these deductions, what difference it would make in the cost of manufacture and delivery of gas to the burner and the people?

A. I have not the figures here, but it would make quite a reduction in the unit cost.

Q. Couldn't you approximate it or just figure it out for me?

A. Give me the amounts you want deducted.

Q. The first item is $10,000, Engineers U. G. I. The next item is $5,600 representing litigation; and the next $2,000, representing donations, being a total of $17,600.

A. I got it 63.1 cents per annum; I haven't checked it back.

The MASTER: Is that the year 1910?

1925 A. Yes.

The MASTER: That reduces it from 66.4.

A. Yes, to 63.1.

Q. Now, Mr. Hagenah, I want you to take up with me Exhibit 27. I want to understand that a little more fully. It is the schedule comparing capital expenditures as per the books with the average of engineer's present value. Now expenditures as per books the first

item under the title of real estate I see that is left in blank, and the next column expenditure as per books, redistributed $54,815.26; now how is that redistributed?

A. I will have to go back and refer again to my report to the company. In that case I combined land and buildings under the general head of extensions and improvements. I did that for simplicity and merely for convenience so that I could get all the detailed items on one page of paper. For the purpose of comparing this analysis with the engineer's figures who had a similar detailed classification I had to separate land and buildings from extensions and improvements. I also found this one item $285,000 charged as a single item and covering several classes of property including some land and a holder and some mains and an oil storage tank. No value was placed upon these different items other than the inference that they were all covered by the single charge of $285,000. In order to make my figures so that I could compare them with the engineer's I had to distribute that $285,000 over the different classes so that what I thought was a fair amount for the holder would go into the extension improvements alone and would appear separate and I would charge a certain amount to the distribution system and dispose of the oil tanks. That is a matter of my own judgment. I did not change the total.

1926 Q. The $285,000 you undertook to distribute, you had some detailed information with respect to it?

A. Only from general information, no written information, because there is no analysis of the company's books as to the value of those different items.

Q. Is it possible for you to produce an itemized statement of the items or a statement of the items showing this $825,000?

A. I could not produce a statement. I do not recall that it includes any other items than those I mention—some land and some distribution of the mains in the village of Valley Junction, a one million cubic foot holder and one hundred thousand gallon oil storage tank.

Q. Did you look up to see when that holder was constructed?

A. No, sir.

Q. Have you received any information on that?

A. I have talked about that; my recollection is it was constructed shortly preceding the consolidation of the Capital City Gas Company with the Valley Junction property, making the Des Moines Gas Company on March 1, 1906. I don't remember even whether it was in the course of construction at that time.

Q. As I understand it, it was one of the principal items entering into this $285,000.

A. Yes, sir.

Q. I believe you attempted to explain it on the theory that it may have been constructed without having been duly authorized under requisition?

A. I am not trying to explain it; I can't see how that condition might have existed.

Q. Did you have any explicit information which suggested that thought to you in this case or was that your mere conclusion?

1927 A. A little more than a mere conclusion. In the journal entry covering the consolidation of this property March 1, 1906, there is a reference to this transaction and in my inquiry as to what the $285,000 included, the information was given to me that it included this holder which was being constructed and did not appear on the books of the Capital City Gas Company, but since the consolidation was made at this time it was embraced in this one lump charge that included the several other items.

The MASTER: In other words, this $285,000 represents work that was begun by the companies before the transfer to the Des Moines Gas Campany but had not been entered upon their books yet because not completed?

A. It had not been completed; whether it was actually being constructed by the Capital City Gas Company I am not sure, but it certainly was constructed for their use; any way it had not appeared on their books but was a construction for their use.

The MASTER: That was your information?

A. Yes, sir.

The MASTER: You had no personal knowledge of it?

A. No, sir.

The MASTER: The books do not show it?

A. No, sir.

Q. That is merely your conjecture and your analysis of the situation?

A. Based entirely upon the information I got.

Q. Do you know what real estate was included in the $285,000?

A. I was told, but I do not remember. I was given a description of it in the terms of lot numbers in Scott and Dean's Addition, Fort Des Moines.

1928 Q. Real estate situated within the corporate limits of the city of Des Moines, or was it situated in Valley Junction?

A. I am not familiar with the city, whether Scott & Dean's Addition is in Des Moines or not.

Q. If it was in Scott & Dean's Addition it is in the city of Des Moines.

A. Then it was in the city of Des Moines.

Q. Do you know how much was included in that amount for property in Valley Junction?

A. No, sir; there was no expression to show the cost or any of the value of those items. It was just one charge covering the several items and class of property.

Q. Well, going now to the item of $54,815.86, that is the amount of real estate as distributed?

A. By me solely as a matter of my own judgment.

Q. I want to ask you, how much did the books show had been paid for real estate?

A. I don't recall the figures. I did examine them; there were purchases back as far as 15 or 18 years ago, for which the company did not pay a very large amount; I recall I considered it a very small amount at that time. There was one charge for real estate to the amount of $25,000.

Q. It was important, was it not, in distributing it?

A. Yes, it was important.

Q. To know what the company had actually paid for real estate?

A. Yes, and in arriving at this $54,000 I went back and recalled those specific items and inquired about them. This table you understand was completed after I came to Des Moines and from that information shown on the books placed a general value for a particular part of this $285,000 and I placed it at $54,815. I had no
1929 record information on that point. It is merely my own judgment.

Q. Do you have much confidence in this Exhibit 27 as to the results?

A. Yes, I have every confidence in it, because if I had been wrong in placing the amount here of real estate by several thousand dollars, placed it too high or too low, the correction appears in one or the other; it cannot be very material; I have not changed the total; it is merely a question of distribution of certain classes of property. It would affect the last column in this table in this way: if I had entered $50,000 as the value of real estate instead of $54,000 there would be a difference in the item of $188,000 by $4,000; then if I had stated it lower by $4,000 I would not have had to charge it to the other; the total is not in any way affected.

Q. Have you any memorandum or data from which you made up this distribution?

A. No, sir; I have not. The first column is based upon my report and the second is based upon the first with my distribution of the $285,000.

Q. You have no memoranda of that detailed information?

A. I simply make the deduction for you now if you wish, just deducting the first column from the second.

Q. In making up this table, Exhibit 27, did you make it up without having a memoranda?

A. No, it was based upon the three engineers' reports and the books——

Q. I understand you; the expenditures as per books redistributed, that is the item I inquire about?

A. I have no data on that that.

Q. Where did you have the data?

1930 A. I can work that out in about ten minutes.

Q. Very well, do it.

A. (Witness computes.) All I do is just deduct the first column from the second in my report schedule 1, Exhibit B, the item $285,000 which represents the general charge covering several classes of property but not separated by the company, is included in the first column under extensions and improvements for the year 1907. Therefore to make a distribution of that item I would have to deduct from the total extensions and improvements at the close of 1910, which amounts to $806,380.46 and appears as such in the first column of Exhibit 27, and would have to deduct such amount as in my judgment it is not proper to include under extensions and improvements. I said this general charge to the best of my knowledge cov-

ered land, one million foot holder, one hundred thousand gallon oil storage tank and certain distribution property in Valley Junction, as to the amount I have no knowledge. For the purpose of this table I distributed by deducting from the $806,380.46 the amount of $155,000.

Q. Where did you get that?

A. That represents my judgment as to the value of the property not to be charged to extensions and improvements.

Q. How did you get at that $155,000—what is your detailed information on that?

A. I am not through with my answer.

Q. I beg your pardon.

A. That $155,000 must then represent the investment or cost of the property transferred representing mains, meters and services. I distributed that amount also according to my own judgment and put $105,000 as addition to street mains; $25,000 as an addi-
1931 tion to the meters account; and $25,000 as an addition to the services account. After deducting this $155,000 from $806,380.46 I had a remainder representing in my judgment the extensions and improvements to the amount of $651,380.46 which includes a certain amount of real estate, and I have separated that as shown in the second column into the two items of real estate $54,815.26 and $596,565.20 the totals balance.

Q. So that it all gets back to the question of judgment?

A. It is judgment as to the distribution of the $285,000.

Q. And the reliability of your information?

A. Yes, the amount which I left in the extension and improvement account, amounts to $130,000 and would cover the value of the million foot holder and the real estate. I have no engineering experience and knowledge and do not know what the million foot holder is worth other than what the engineer's reports contain and I did not consult those.

Q. Did they help to make this table?

A. No, I talked with Mr. Randolph as to what he thought was the fair value of such a holder. He did not tell me as I recall it what he put that item in his report at. I did not know from him what his appraisal was; as I recall he said it would range from about a hundred thousand to $110,000.

Q. What I wanted to ask you is this, Mr. Hagenah, that the figures which you have used and the information upon which you relied in assuming those figures, forms the foundation for your whole structure?

A. Not at all; it is merely a question of the correctness from and engineer's standpoint of the distribution of $285,000 of which
1932 I know several items, but had no accurate knowledge as to the value.

Q. But the $285,000 is assumed by you to be correct?

A. I have no assumption; it is figured on the books.

Q. It is assumed by you to be the amount actually expended and properly charged?

A. Yes, sir.

Q. Did you see any vouchers for it?

A. No.

Q. Then you must have assumed it was correct?

A. Yes, it is property taken up in the consolidation.

Q. If it should turn out that your assumption was erroneous, would that make any difference?

A. If my assumption is erroneous as to that, it would make a difference in the amount in which my assumption was erroneous.

Q. And it would also make a difference in making up your judgment as to the amount to distribute from these other items, if the information turned out to have been a mistake?

A. To the extent of your assumption it would affect it, yes.

Q. In other words, the judgment which you express in these figures is predicated upon the information which you received either from the books or the verbal statements made to you by others?

A. The verbal statements and information as to the manner of the transfer and the existence of the property, as to the physical existence of the property; there is a million foot holder there and a 100,000 gallon oil tank.

The MASTER: Mr. Randolph puts it at $135,600 without any deduction?

A. I have not seen Mr. Randolph's figures.

Q. What figure did you use representing that item of holder?

A. $130,000.

1933 Q. This $130,000 which you assume was the price for the holder, did that include the storage tank as well?

A. Yes, it would in my assumption.

Q. Now, the next item is extensions and improvements. I understand you take $806,380.46 that is taken from this same column in schedule 1 Exhibit B?

A. Yes, sir.

Q. Now you decrease in the next column that amount to $596,-565.20 and by what method do you arrive at that amount in your distribution?

A. That amount is reduced because I have taken out of it the allowance for real estate, and what I thought was a fair proportion for mains, services and meters.

Q. Do you know how much you took out for real estate?

A. No, I do not recall.

Q. Have you any detailed information?

A. Not with me, no sir.

Q. Have you at the hotel?

A. No, this material here of the real estate item is made up of my recollection of the charges on the ledger for the different items, that is land, not real estate, of which one charge was $25,000 and others of a very much smaller amount, $500 amounts of that general size; I don't remember all of them, and I added to that a certain value for a certain part of this $285,000 which I was told included some real estate, in what I described as land in Scott & Dean's Addition.

Q. Then again, you relied upon the verbal statements of others as to the real estate?

A. Yes, sir.

Q. And as to the other items, as to the existence of those items?

1934 A. Yes, sir; I have not visited the plant with the particular idea of visiting those one *are* two parcels of land and I could not identify them without a survey and record.

Q. This table, Exhibit 27, represents your individual efforts based upon the books company and information furnished you by officers or employés of the company, or the engineers who have testified on behalf of the complainant company in this case?

A. In part, and only to the extent that I consulted them as to the proper distribution as to this general charge of $285,000. The other parts are matters in this case and I did not change any figures on that.

Q. Take for instance your judgment as to how much you would eliminate from the $806,380.46 representing the expenditures on the books for extensions and improvements, you deducted therefrom the amount of $203,815.26 and then you proceeded to take that amount and distribute it over the other items?

A. I did not deduct as much as you say. The deduction which I did make is not the figure you gave, but $155,000.

Q. You gave $806,380.46 that is the expenditure for extensions and improvements as shown by the books?

A. Yes, sir.

Q. The expenditures by the books redistributed, $596,565.20 so that you had $203,815.26 to place somewhere else, did you not?

A. Yes, part of that branches into real estate which is the new account appearing in the second column; the amount which I had really taken out of the $806,380.46 is $155,000.

Q. My question was that you had that amount which you distributed?

A. Yes.

Q. Now, as to meters, in the first column I find the amount

1935 to be $187,755.93.

A. Yes, sir.

Q. And you have increased in the next column the amount to $212,755.93 increasing it about $25,000; is that $25,000 a part of this $203,815.26?

A. Yes, sir.

Q. What was the basis of your judgment in arriving at that conclusion?

A. Just conversations with officials and people acquainted better with the property than I was.

Q. That is true of your entire exhibit here, number 27, as far as distributing this $285,000 is concerned.

A. Just only to that item; where there is no record information; I know the general property which was transferred and I used my judgment as to the amounts. You see I used round numbers; it does not affect the final result.

Q. You did not have to rely upon the information furnished by others in respect to the cost of the real estate?

A. No, sir; that price is on the books.

Q. Except the last that was purchased in Scott & Dean's Addition?

A. Yes, sir; there being one item in that $285,000.

Q. Now, Mr. Hagenah, taking these several exhibits which you have produced here to illustrate your theory of the value of the investment, I wish you would tell us, if you will, just what the actual structural cost of this plant is as shown by the books without any reference to your analysis for figures?

A. According to schedule 1, Exhibit B, of my report $1,928,016.65.

Q. Did you take from that the $264,000 which they charged off?

A. Yes, sir.

Q. Where does that appear?

A. That does not appear here, because it is not a charge; that was a credit.

1936

Q. Where is it shown in your report that you have given any credit for that?

A. If you will return to schedule 1, Exhibit A, you will find the amount in the upper half of that schedule.

Q. Is your report paged?

A. I think it is on page four.

Q. That is taken out on your total here of the value of the investment. What I want to know is, did you take it out and deduct it from this $1,928,000 in round numbers?

A. No, I have not.

Q. If you did that, would it make any difference?

A. Of course, if you subtract an amount from a given figure it will reduce the figure by that amount.

Q. I mean it would affect the general results, would it not?

A. It will disturb the entire table if you do it that way; that is not the correct way.

Q. Is there any reason why that amount should not be deducted from the physical cost of this property where you find there has been a charge of depreciation to this amount?

A. That gives you the present condition, which is not what my table shows; my table shows the cost of the property. I have not made any change for appreciation or depreciation.

Q. I was asking you to tell the Master just what the actual book cost of this physical property was?

A. Which I did.

Q. That is, $1,928,000; in that sum can you find the company charged off the $264,000 in round numbers?

A. From the book value?

Q. Whether it is book value or book cost, that is the amount in actual figures.

1937

A. Yes.

Q. And that represents the company's theory of depreciation, does it not?

A. Yes, to the best of their financial condition.

Q. And you have substituted your notion of it?

A. Yes, sir; that is, substituted my notion in arriving at what I consider the present basis for rates; I have not altered the books in any way.

Q. I understand that you have not gone and made erasures and entries in the books. But you have worked out a plan here that is distinctly different from the method employed by the company?

A. Yes, sir; I have taken a radically different method.

Q. Do you know when the public utilities first commenced to show a depreciation account in connection with their business?

A. As a general historical proposition?

Q. As a general rule?

A. Yes, very little has been done with the scientific analysis of depreciation until the public service commissions came into use, notably the New York Commissions and Wisconsin Commission.

Q. Was that the genesis of it, or was it at the time the famous case of the Knoxville Water Company against the City of Knoxville?

A. As I recall it, I was working on our classification of accounts before the Knoxville decision was rendered. I attended several conferences and was a member — classification and uniform accounting committees where we were struggling with that classification before the Knoxville case.

1938 Q. You were proceeding no doubt upon the theory as you proceeded in this case, that it was proper, inasmuch as the companies had overlooked something to their advantage, and which was right to have carried along, that you would have the right to distribute that over the series of years in which the plant had been in operation?

A. No, not at all as you put your question.

Q. Suffice it to say, prior to 1909 this company had never charged anything off for depreciation as far as the books are concerned?

A. They handled it different before the companies understood the uniform handling of these accounts.

Q. I am not going to dispute your right to claim the honor of this method over the Supreme Court of the United States. It is sufficient to say, since that decision there has been some effort on the part of accountants and public utilities to take care of this depreciation account; that is true?

A. No; accountants have been struggling with this problem ever since the science of accounts sprang into use. It was not until the time of the Knoxville case you refer to until the companies actually awakened to the fact.

Q. Some very astute accountants in that case had endeavored to *to* spread the depreciation over the life of the plant and the Supreme Court held that was improper, that the consumer was not to be required to pay for their mismanagement?

A. I haven't a copy of that 212 U. S. page 1 with me. I presume it is so stated there.

Q. The effect of your theory and the result of it is to do that very thing; isn't that the sum total of what you want to do?

A. I cannot answer your question yes or no, other than to say

that in the absence of providing for depreciation in the man-
1939 ner it is now cared for and as it has been discussed in the recent court decision, it has not the slightest——

Q. Let me ask you this question, Mr. Hagenah: Assuming for the purpose of the question that you must eliminate all question as to the depreciation prior to the year 1909, when this company undertook to carry a depreciation account; that you must eliminate that from your theory and start out on the basis of depreciation from 1909, would that make any considerable difference in your computation and the value of your investment?

A. Yes; the answer would be wrong because it would be founded upon the wrong assumption which you include in your question.

Q. Then if the assumption is wrong, included in my question, in order for you to demonstrate your theory, you must charge depreciation over these years, going back to 1887 and as far back as you have any history of the plant?

A. Yes. Don't you see when you do that and use present value of the plant that you are penalizing the investor by using the present value of the plant instead of the cost new; referring to the court decisions we use the present value of the property.

Q. I am not going to discuss the law with you on that point, I just simply wanted to know if you abandoned the depreciation account and eliminated it prior to 1909, it would make considerable difference with your figures?

A. Of course if you eliminate it altogether it makes that much difference.

The MASTER: Mr. Brennan, it strikes me if that depreciation account is kept up to its present value altogether, there is no necessity of figuring it at all.

Mr. BRENNAN: In order to demonstrate this theory, he must come in and show us in what manner the company kept its books.
1940 When I ask him the question what he finds upon the books and if that represents so and so, he says yes, together with my analysis of the figures.

The MASTER: So far as his theory is concerned that is another proposition. There is no necessity of figuring depreciation at all, because there is no depreciation where it is kept up; there can't be any. But to my mind the only thing I *I* think to consider is to know what the depreciated value of the plant was at the time he begins to figure in 1887, because he figures depreciation.

The WITNESS: I can only say if any confusion exists in re- to that, it is due entirely to the manner in which the questions have been put to me. If it is desired, I would be very glad to explain it at length.

At this time an adjournment was taken until 1:30 p. m.

1941 1:30 P. M., WEDNESDAY, *August* 9, 1911.

Mr. GUERNSEY: If there is no objection we would like to interrupt the cross-examination of Mr. Hagenah by putting on two witnesses who live out of the city and want to get away tonight.

Mr. BYERS: No objection.

ANDREW COOKE, being called on the part of the complainants and sworn and examined in chief by N. T. Guernsey, Esq., testified as follows:

Q. Your name is Andrew Cooke?

A. Yes, sir.

Q. Where do you reside?

A. Chicago.

Q. What is your business?

A. Vice President of the Harris Trust & Savings Bank.

Q. How long has that bank been in existence, who did it succeed?

A. It was formerly the Chicago office of N. W. Harris & Co., which was organized in 1882 and the bank was incorporated in 1907. Affiliated concerns are still in New York and Boston.

Q. What department of the business are you in?

A. I give my attention primarily to what we call the corporation business.

Q. And what is that business?

A. That is the business—it is the purchase and investigation of public service properties and public service bonds and properties, gas, electric light, water works, street railway and railroad.

1942 Q. In a general way can you give us the volume of the bond business transacted by the Harris Trust & Savings Bank and the affiliated firms in Boston and New York.

A. The last full year I think it ran about 150 millions of bonds that were purchased and sold direct to investors and running beyond that now considerably, I don't remember now just what the figures are.

COURT: You mean 150 million a year?

A. Yes, sir; 150 million a year of all kinds of bonds. We have handled more than a billion, I don't know how many. I think we are the largest distributors of bonds direct to investors in the United States.

Q. How broad is the territory in which the Harris Trust & Savings Bank and firm of N. W. Harris & Co., preceding it has bought and sold these bonds of public service corporation-?

A. We cover the entire United States and Canada, buy issues in all—practically all of the states and in Canada.

Q. How long have you personally been connected with this business?

A. 12 years. I first traveled for a couple of years practically over the entire country buying municipal bonds and the last ten years I have been engaged on the corporation end of it, examining

the properties and accounts passing on the securities, reorganization and that sort of thing.

Q. What is the fact as to whether you are the head of this department of the Harris Trust & Savings Bank?

A. Subject to Mr. Harris and the directors of course, that sort of thing is in my charge.

Q. Now to what extent does the purchase and sale of these securities bring you in touch with the operation and with the extensions and general affairs of these corporations which issue these bonds?

1943 A. Well to a very large extent. I presume that in an advisory way I consult with these various companies on practically every phase of their business as the purchase by us of corporation bonds does not cease from the time they are taken up until the bond is sold, we follow the securities clear through until the time they are paid off and if not paid off have to go in and reorganize the property.

Q. Then the fact you buy an issue of bonds and then sell them you do not drop the matter?

A. No, we would like to oftentimes but we cannot as a rule. We follow them through to see that the management of the property is all it ought to be and our trust deeds are drawn in such a way that the property has to be handled properly and we find that our mortgages are usually drawn in such a way that bonds may be issued for extensions and additions and all that sort of thing so we have various funds we have to check vouchers and all that sort of thing and have construction work to pass upon by our engineers and accountants and in a general way we are in touch with practically every phase of the business.

Q. You have to do this on account of your obligations to the persons who purchase from you?

A. On account of that and on account of the fact we are continuing to buy additional securities from time to time so that we keep in touch with them.

Q. What is the fact as to whether these corporations while you are handling their bonds make periodical reports to you of their business and things like that?

A. They report in detail every month and we have accounts examination and engineers' reports from time to time in addi-

1944 tion to sending our own men out.

Q. Do you send your own men to inspect the properties and look over the extension?

A. Yes; we have people traveling all the time doing examining and that sort of thing, pass upon the advisability of expenditures and make up our mind as to what the proper return would be.

Q. We have read a good deal in the papers about the reorganization of the street railway properties in Chicago. Did you have anything to do with that?

A. Why our office were the financial people back of the union traction reorganization. I had more or less to do with that and the recent reorganization taking in the consolidated I was chairman of the re-

organization committee. That involved getting a new franchise as it does in a good many places and dealing with the city.

Q. Now Mr. Cooke, I wish you would explain to the Master where the money comes from to these public utilities and how it is obtained.

A. I don't know—if I don't make it clear as I want to do I wish you would question further. We keep in touch with the entire territory and try to keep familiar with the laws of the different states and in some of the states we do not care to invest our money whatever, owing to unfavorable laws, we simply check those off and then through the balance of the territory we are pretty well in touch with the larger cities, we do not feel that the smaller places—they are usually unsatisfactory from the standpoint of investment, the business is not there to warrant the investment and they do not earn enough so they can afford to have proper management so we
1945 usually confine ourselves *ourselves* to the larger places and we know what the gas plant in this place and the electric light and water power here and there are, and very frequently before a property is constructed it is brought into us by local people and they have an idea it is very easy to get money, that the bonds are selling at a certain rate, and they think they have a mighty fine investment, people will make money in their manufactury or something of that kind. They don't want to put up very much money, just have an idea if they get a franchise or right of way or something of that kind, that is about all they have to do. We usually tell them it is absolutely necessary for them to get in touch with some of the people who are owners and manage- of properties that public service business is their specialty and that no local people with no experience and with but a limited amount of money can successfully go into public service business in any good sized city. The result is that while we hear of these properties we do not have much if anything to do with them until they eventually find their way into the office of some concern like the United Gas Improvement Co., or Stone & Webster, the H. M. Byllesby & Co., people that are experts in that particular line not only in the management and construction of properties, but raising the money so that as a rule we buy the bulk of our securities from concerns who are what we call large producers of securities, people who understand their business and who carry properties along until such time as they are an assured success. They have to raise their money in various ways. They have primarily to put their own credit back of it and if we have property that is owned or controlled by one of the larger operating companies we feel reasonably sure that the management will be what it
1946 ought to be and that they would not have their money in there if it was not a good proposition consequently properties handled that way usually the bonds for part of the costs, they take that additional risk of placing the money ahead of them. Then we buy those bonds outright and they eventually go to the investor, the investor has the bonds bought a long time before the small investor or bank or trust company put- the money in the securities and finally they have a going concern but they have put their money in a long while after the original investment has gone in.

Q. Do you know what rate of return upon the money invested in

these public utilities in this part of the country it is necessary to promise in order to attract capital to these investments?

A. I think I do, yes.

Q. Now I wish you would state to the Master whether this is a fixed factor or a variable factor and if it varies state what the considerations are which affect the amount of this return or affect what amount this return must be in order to make it attractive.

A. Of course it must vary according to—each proposition stands by itself and I have always worked the thing out about this way that factors in determining what would be a return which people would want before putting their money into a proposition of this kind would consist of say six per cent first as a mere return on the money.

Mr. Byers: I did not make any obuection to the question because that does not call for any amount, but as the witness is stating amounts we object to it.

A. I will leave amounts out. The first factor to be considered would be return by way of interest for the money, for the use of the money. The next would be perhaps the risk or hazard
1947 which would have to be assumed and which would exists for various causes and over and above that there would be the profit or return which people would feel they ought to have to compensate them for their brains and experience and for time put in and for the credit which they would have to enable them to carry properties through successfully.

Q. What is the fact as to whether or not the expense incident to looking into the property, examining the property and caring for it and watching the investment is another factor that must be taken into account here.

A. It certainly has to be. You are there with the property from the time you invest in it and in addition to what I have mentioned there is the factor which is a very important one that you never can get away from and that is the liability it calls for to continue to invest more money in the property to take care of extensions and additions whether there happens to be a panic or whether money happens to be easy they have got that unlimited liability to pour in more money year after year, and have got to figure for every dollar increase in their gross earnings they have got to put in three or four or perhaps five dollars in additional investment.

Q. Why is this that additional investment is a requisite at any time especially in this part of the country?

A. The growth of the cities and no- of these properties stands still and that is one of the greatest problems which any of these public service companies have is the problem of raising money to take care of growth of the business which is due to the usual more or less rapid increase in population.

Q. Now take, Mr. Cooke, a situation such as we have here in Des Moines, you are more or less familiar with Des Moines per-
1948 sonally?

A. Yes, sir.

Q. You have been coming here more or less frequently for how long?

A. Oh practically ever since I have been with the house I have been here off and on.

Q. And at one time the N. W. Harris Company bought a small issue of the bonds of the gas company in Des Moines?

A. Prior to my connection with the house, yes. That issue was paid off, a very nominal amount on the plant and was paid off in 1906, some such time as that.

Q. Now take the situation in Des Moines here with a population of about 86,000, a growing city, a gas plant here, involving an investment which it would cost to reproduce it after you took the depreciation, reproduce the physical property with the business attached to it of say, $3,100,000 to $3,150,000 and assume there were no abnormal conditions in the laws or no unusual conditions in the laws of the state, what in your judgment would be such a return as to induce capital to invest in such an enterprise?

Objected to as incompetent, immaterial, no proper foundation having been laid for the inquiry, the witness is incompetent and the question is based upon an assumption that is not in the record.

A. I think that if I could answer it by saying assuming that the laws and the franchises situation was favorable furnishing adequate protection to the investor that at least ten per cent would be required to attract capital. That is ten per cent after allowing for all operating expenses the taxes, and full charges for maintenance and depreciation sufficient to keep the original property of the investment unimpaired.

Move to strike out the answer as voluntary and incompetent and immaterial.

1949 Q. In some of the states take Wisconsin as an illustration there have been some laws enacted making the matter of the regulation of rates and regulation of service and capitalization by the control of a central body being the board of railroad commissioners there and providing for franchises which continue so long as the public service corporation continues to perform its duty to the public and also providing for the exclusion of competing public utilities so long as the existing utility furnishes adequate service. What effect if any have these laws had on the return which would attract capital to the business or to put it in another way upon the attractiveness of the investment.

Objected to as incompetent and immaterial.

A. You mention Wisconsin, I think that is as good an example of the condition that you refer to as any. The control of public utilities by commission is still—the results of that are still more or less uncertain. I think that investors and people who purchase and operate public service companies are waiting to see what the attitude of the Wisconsin commission is going to be in reference to valuation and return upon investment which the commission will allow. I was asked that same question at a hearing before the Wisconsin com-

mission, the chairman of the commission, Mr. Myer now interstate commerce Commissioner, asked me the same question practically and I told him then I thought the people were going to wait awhile to see about what Wisconsin was going to do. I know certain interests where that is true where the people are waiting to see what the attitude of the commission is and I replied to Mr. Myer it depended somewhat upon whether the commission continued to stay out of politics or whether there was political influence brought upon it which would result in the corporations being harrassed
1950 through the commission the same as they had been through the local city councils and said whether or not the investors were going to consider that the protection of such a law as a good thing and result in their being willing to invest money in Wisconsin at a lower rate than elsewhere where conditions were less favorable would depend upon what sort of a protection it was. If it was the sort of a protection that the fellow in the penitentiary gets, allowed to live on bread and water, he is there now and nobody can get in, nobody wants to and he can live along on bread and water if they are going to hold them down to that people who have got their money in the properties will have to keep it there, but you won't get any additional money to come in. These companies will hold back the investment of additional money assuming that the commission takes a fair view as it apparently wants to do, it seems to be reasonable and want to find out what is fair and reasonable as to the matter of investment in public service corporation- and to make them attractive that is a very much better situation than existed in Wisconsin prior to the passage of the law giving the Commission jurisdiction over these companies.

Q. Now in Iowa the law is now as I understand it that no city can grant a franchise to a gas company for more than twenty five years or can by any contract afford to the investor any assurance that at the end of the twenty five year period he will not be required to remove his plant from the streets. I wish you would state whether or not that would be a factor affecting the attractiveness of such an investment and how it would affect it in any sense and whether it would render it more or less attractive.

Objected to as incompetent and immaterial.

A. When I mentioned 10 per cent as the return which I
1951 thought would surely be demanded it was investment under favorable conditions. I regard what you mention as distinctly unfavorable and it would give an investment in Iowa a very speculative feature. I don't believe you could say you would want 15 or 29 per cent or any speculative return if you were going to invest in Iowa for the reason you probably would not be able to earn it. The result would be these conditions named the investor would do what we have done, keep out of the state of Iowa until the laws become more favorable.

Q. Now there is another thing that I understand is provided for by our statutes and that is that cities through their councils are vested with the power to regulate the rates which are to be charged by gas companies the law expressly prohibiting their making any

arrangement for a rate which covers any specific time. I wish you would state whether from the investment standpoint that would be regarded as something that was favorable or unfavorable.

Objected to as incompetent and immaterial.

A. I would consider it very unfavorable if the regulation particularly in view of the fact the regulation of rates is left with the local body.

Q. The law here as I understand it authorizes cities to themselves institutes gas plants and yo- operate them and also expressly provides that no exclusive franchise to op-rate a gas plant shall be granted to any one or for any term. I wish you would state whether in your judgment that is a factor which would effect the desirability of the investment and if so in what direction?

A. I think it would very seriously interfere with the ability to secure capital for Iowa properties.

1952 Q. There is another provision in the laws here to the effect that cities may condemn and so acquire gas plants which are located in the cities. I wish you would state whether that would be a factor affecting the desirability of investment in gas properties in Iowa.

Same objection.

A. I would make the same answer, yes I think it would seriously affect it. The right to purchase in itself is not particularly objectionable if the right can be exercised at reasonable periods and a full allowance is made for going value and all that sort of thing so that the investor would know that under no circumstances could the plant be purchased at a price which would not see him out on the principal of the investment. I know that people want to keep their investment permanent but will sell it out for a good fair price for it but ordinarily condemnation proceedings instituted by a city do not usually result in that.

Q. Take the case of the gas plant in the city of Des Moines with the conditions here as you know them, with the laws providing that a franchise may not be granted for more than twenty five years, that no exclusive franchise can be granted, that the city may at any time establish a competing plant, that the city may at any time authorize a competing private company to engage in the business, that the city may at any time divest the company of its property by condemnation proceedings, that the city may at any time regulate the rates and is prohibited from making any agreement for a rate for any period and taking into account also the further fact that under the laws of the state of Iowa any corporation if a local corporation, that is an Iowa corporation owning this property can issue

1953 no stock which is not fully paid up when issued and cannot incur a debt that exceeds two thirds of its capital stock and I wish you would state what return in your judgment would attract capital to such an enterprise?

Objected to as incompetent, irrelevant, based upon assumptions

that are neither in the record and some of them that are not in fact in existence at all.

A. Answering on the basis of the situation as you state it to be, and from my own general knowledge of the conditions here in Iowa as a result of investigations which we have made I don't know that you could pay any rate that would attract capital, I think it would drive capital away, that is the situation. They might possibly if they could get property for half what was its structural value or something of that kind and take the speculative chances of the conditions changing, it might be possible capital would go into a speculative business but certainly not for an investment or operating business.

Cross-examination by H. W. Byers:

Q. I judge from your answers you regard Iowa as a very undersi-able state for investment?

A. I do, yes.

Q. Your house is called what?

A. Harris Trust & Savings Bank.

Q. What is their particular business?

A. Handling of investment bonds.

Q. Speculating in bonds?

A. No, purchasing and selling them.

Q. Well isn't that speculating in them?

A. I don't regard it so no, sir.

Q. How long have they been doing that?

1954 A. Since 1882.

Q. Was the company organized in 1882?

A. As N. W. Harris & Co.

Q. What is its capital?

A. The Chicago Harris Trust & Savings Bank has three million capital and surplus, upwards of that, and the New York and Boston offices as much more. I think it is about seven and one half millioj all told.

Q. Does that represent its assets now?

A. No, we have got a lot of bonds on hand.

Q. What is the company worth?

A. Why I don't know. Five hundred doll-rs a share bid for the stock and none offered.

Q. $500 a share?

A. Yes, sir.

Q. How many shares have they outstanding?

A. 12,500. I mean, I am now simply referring to the Chicago office, the New York and Boston offices are close corporations.

Q. Take them all that are represented by the various concerns, if that is the parent concern in Chicago?

A. What is the question again.

Q. What is the company worth?

A. That is a matter of opinion between the people owning it. It is not for sale as a matter of fact.

Q. Give us your opinion, Mr. Cooke?

A. Well what bearing has that?

Q. We will see when we get through with this cross examination.

A. I don't know that I care to answer it unless the Master rules I must. I don't know how what it was worth would have to do with the gas business in Des Moines.

1955 Q. It might have a whole lot before we get through with it. Let's have your judgment.

A. I have not any opinion on it only according to experience.

Q. There are how many shares outstanding?

A. 12,500—I would say 15,000. A million and a half capital, a million and a half surplus, some undivided profits and the New York and Boston offices have a capital of three or four million.

Q. Been in business how long?

A. Since 1882.

Q. Made your money investing in bonds for the company and for your clients?

A. Yes, sir.

Q. Bonds and stocks and other securities?

A. We don't handle stocks. The loss to our investors has been less than one day's interest on the amount of bonds we have handled.

Q. You have handled bonds from nearly every state in the union?

A. Yes, sir. Some from Iowa.

Q. Not only for the company itself, but for clients of the company?

A. I don't know what you mean by that.

Q. Well you buy bonds for people who deal with your concern don't you?

A. We buy them outright and sell them at retail. Buy them wholesale and sell them at retail.

Q. So that the business of the company then is buying and selling bonds for a profit?

A. Yes, sir.

Q. And it has been quite successful hasn't it?

A. Fairly so I judge.

1956 Q. Now what is there about the laws of Iowa that you think are unfavorable, what particular law do you think is unfavorable to investors aside from this power of the council to fix rates.

A. Well the power of the council to regulate rates at any time is a very undesirable factor.

Q. You have that same situation in your state don't you?

A. No, we can get a franchise there where the rates are fixed for the term of the franchise.

Q. The power to fix rates in your state especially Chicago is given the city council isn't *is*?

A. That is somewhat of a question. It is being tested I believe in the gas case. The gas company has a perpetual franchise as I understand it, and probably carries with it the right to regulate rates and the other companies have fixed franchises. They have no such law as you refer to here in Iowa.

Q. I am not asking about any law in Iowa, simply asking you if it is not true city councils in your state have the power to fix rates.

A. I don't know it is so.

Q. What state in the unio*j* do you know that they don't have?

A. Wisconsin for one.

Q. That is because the whole business is turned over to a commission.

A. Yes, sir.

Q. Now what other states?

A. Well I don't recall of there being many states and I could not recall any besides Iowa at the moment where the right to regulate without power of the council of the city to waive the right to fix a rate of return for a certain definite period exists. As I understand it practically all states have franchises in which rates are fixed during the life of the franchise.

1957 Q. Isn't that what you understand they can do here?

A. No I understand here in Iowa you get the right to do business for 25 years, after that you have got to take up your plant if the city don't want to give you a new franchise and scrap it, junk it, and in the meanwhile any city administration or lawyer who wants to make a reputation for himself can stir up agitation to regulate rates the result being you are in hot water all the time or liable to be.

Q. The ideal conditions from your standpoint would be to let the company make its own rates wouldn't it?

A. No, by no means, I don't think anything I have said would indicate that.

Q. What state do you know of in the union at this time that does not have power to condemn a gas plant, taking it over?

A. I am not a lawyer, I don't know that, I presume there are statute- possibly in all the states, it might be that the inherent power in the state itself to condemn under the exercise of the right eminent domain that might be extended to the cities, I have no knowledge on it.

Q. Why do you say in a state where they have that power it would be an unfavorable condition.

A. Because my impression is that this law in Iowa is peculiar and that I don't consider it a good public policy and I don't believe such conditions—I don't believe the attitude of other states is the same as that of the state of Iowa on that particular subject.

Q. It is not conducive to speculative rates and unreasonable charges.

A. I would say it was conducive to speculative rates, I should think any rate made would be speculative under these conditions. I think it would be anything but fixed.

1958 Q. You would think that would be speculative?

A. Yes; I would regard it as such. Anybody who bought taking his own chances.

Q. What effect does it have on an investment to have the law require corporations to have a paid up capital, does that make it unfavorable for an investment in bonds?

A. Not necessarily for investment in bonds, but it does make it difficult to raise money for the construction and financing of companies.

Q. That is to say you can't sell watered stock in a state where they have that kind of a law?

A. Yes, I think that is a fair statement of it, but I know I have never seen it demonstrated that a l-w prohibiting the sale of watered stock was going to be conducive to the best interests of the public.

Q. I didn't quite inquire for that suggestion, I think but we will let that stand?

A. Oh you can strike it out, it is immaterial to me.

Q. Now Mr. Cooke, another thing, you say that the fact that city councils have the right to fix rates and that a franchise can only be granted for 25 years, is an unfavorable condition so far as investors in public corporations is concerned and reduces the value of the investment, that is right isn't it?

A. Yes, sir.

Q. That is a fair inference from your testimony?

A. Not necessarily the 25 year franchise feature, that depends a great deal o/ the attitude of the city.

Q. Would it make any difference to you if there was a provision in that same statute for the renewal of the franchise in the same way you got it in the first place?

1959 A. That is upon the terms you got it, it could be renewed exactly? A twenty five year franchise you have got to take chances where you get off at the end of the term.

Q. You stated you understood the law in Iowa was at the end of 25 years you had to scrap your property unles- you made some deal to dispose of it?

A. I understand it to be so. Our experience has been such.

Q. It is not true however that is not the law?

A. I am glad to know it.

Q. Now another thing Mr. Cooke, if the fact that a franchise—let me put it another way—assume there is a public service corporation doing business in a city of say 86,000 people in a city where the term of the franchise is limited to twenty five years and subject to renewal in substantially the same manner required in the first place and the council have the right to fix rates and this public service corporation is without any franchise at all. How would that affect the value of its securities and value of its property.

Q. I want to get your question exactly, I thought you said starting out with a twenty five year franchise?

Q. (Question read.)

A. I don't think they would be saleable at all without getting a new franchise.

Q. Would it have any effect upon the value of the corporation's property?

A. I don't think the property could be sold at anything like a satisfactory rate, value of property is what you can get for it. If you have got something you can dispose of.

Q. It would reduce the value of the property would it not?

A. Yes, and no. There are a great many companies who
1960 find themselves in that condition but they have chosen to take the ground that they are not going to run and let the state acquire the property except at a price which is a fair return. They are going to trust to the good faith of the people of the state and work it out in that way and in a great many cases that has been done. But until it is worked out, until the people are satisfied to take the property at less than it is worth or revise or extend the grant on reasonable terms, but as confiscation of the property of course it is not saleable.

Q. Now the argument in this case will be made by the lawyers. You would not take securities of that kind of a company at all would you?

A. Of that sort of a company?

Q. Yes.

A. Not until the franchise had been worked out.

Q. Now in answer to a question in chief you stated that you at some former time and before some commission in Wisconsin told the chairman of the commission that the people were waiting to see what the commission would do. Who did you have in mind by the people?

A. Investors and owners or operators of property with whom I had talked.

Q. You meant people like your own firm that was buying and selling bonds?

A. Yes. And people who were buying and operating properties.

Q. Do the stockholders as a rule operate the properties themselves?

A. Ordinarily yes. They elect a board of directors and they elect a manager and they operate it.

Q. What is the difference between the owner of stocks, in-
1961 vestment in stocks and the owner of bonds, investment in bonds so far as personal attention is concerned to the property in which his investment is made other than the election of officers.

A. The stockholders are looking out for their dividends and the bond holders looking out for the engineers and stockholders.

Q. Their interests I presume?

A. Yes, they are watching them.

Q. It substantially requires about the same amount of brains to take care of money if invested in bonds or stock as it does invested in any other kind of property?

A. Not at all.

Q. What is the present rate in the city of Des Moines for the use of money?

A. I haven't any idea.

Q. What are bonds and stocks selling for what rate are public service bonds and stocks selling for in the city of Des Moines?

A. Bonds of the street railway and Interurban in which we are interested are not selling at all. I don't know about the bonds of the other companies.

Q. You don't know anything about the——

A. We are not interested in the gas company or electric light

company. I don't know but what we did handle electric company bonds at one time.

Q. Since you have volunteered the suggestion about bonds of the street railway company how long has it been since your company offered to carry bonds the security to be upon the present street railway system in Des Moines? Are you familiar with the situation of the Des Moines City Railway and its bonds and stocks?

A. Yes, sir.

Q. Your company hold- or did at one time hold substantially all the bonds of the Des Moines street railway?

1962 A. We have placed them with investors, yes.

Q. When you say you follow them through that is because when you sell them you guarantee bonds?

A. No. Our reputation is back of it, we don't like to suffer default on the principal or interest.

Q. So you follow them up for that reason?

A. Yes, sir.

Q. How long has it been since your company made a proposition to the city of Des Moines to loan money on the bonds or on the security of the Des Moines street railway?

A. Since we made a proposition to who?

Q. To loan money to the city of Des Moines and take as security the bonds of Des Moines secured by the Des Moines City Railway.

A. I am not personally familiar with all the negotiations which we had during the franchise matter with the city. The fact that the N. W. Harris Company, Harris Trust & Savings Bank never made any such proposition. The Des Moines City Railway Company may have, as a basis upon which to dispose of their property. I never followed that out. It dragged along for so long, I lost interest in it.

Q. At what rate of interest were the bonds that your company bought taken?

A. Do you mean the bonds of the city railway?

Q. Yes, sir.

A. We purchased five per cent bonds at a substantial discount, I don't recollect just the price a number of years ago. It was a substantial discount for five per cent bonds.

Q. And — what rate was the gas company bonds taken?

A. I don't know, that was twenty or twenty-five years ago.

1963 The bonds were about twenty year bonds maturing in 1903, that was before my time. I think they were sixes.

Q. Were they sold at a discount?

A. I presume they were, yes.

Q. And the discount represented the profits that your company got?

A. Well we don't—we would buy them at a discount and sell them at a higher price, we might not have realized par for them. The difference between what we paid for them and what we sold them for would be our profit, yes.

Q. In other words if you bought them at a discount and sold them at par, then the difference would be your profit.

A. Yes, sir.

Q. Now do you know Mr. Cooke what the securities, bonds and improvement certificates and that class of securities of Iowa cities are selling for today?

A. No. They are selling about as other municipal bonds of the same character.

Q. Well about what rate of interest do they bear?

A. I suppose straight city obligations are selling around about fou- and a half per cent basis probably now.

Q. Do you know what commercial paper, what rate of interest or for what rate of interest commercial paper is being floated for here in Des Moines at this time?

A. I don't, no sir.

Q. You don't claim to know anything about that?

A. No, I don't know. I suppose about six per cent, I don't know, it might be lower. Might have so much money you are glad to put it out at four for all I know.

Q. It would surprise you wouldn't it, a man in your business to hear that they were carrying as low a rate as three and a half

1964 per cent?

A. No, not at all.

Q. That would not be strange at all you think?

A. No.

Q. It would not be strange to you if I would tell you a large amount of the paper of the business and commercial institutions of your own city was being carried here in Des Moines at a low rate of interest?

A. No. It would be funds that would not be invested in public service securities.

Q. Did I ask you that?

A. No, I volunteered that.

Q. Why did you do that?

A. For your information.

Q. Don't you understand it is your business simply to answer questions?

Mr. GUERNSEY: I object to this, if there is any objection to the answer there is a legitimate way to reach it, that is a motion to strike. It is undignified and improper for counsel to invite the witness to go into an alteraction.

Mr. BYERS: I submit the witness ought to be cautioned.

Q. When you stated awhile ago that the money that was invested in public corporations came as I understood your answer largely through concerns such as yours, and then later you said that the small investors or persons who invested their money in the stocks did not get their money in until later until possible through the hands of concerns like yours, you did not mean to convey the impression that that money came from any particular source did you other than the general investing public?

A. If I may answer that freely I will tell you exactly what
1965 I did mean. I mean people buy bonds from us on the reputation of the house without any particular knowledge of the security that we are offering them. They buy it on the reputation of the house, that is an additional security to them the investigation which we make and our reputation.

Q. Do you sell bonds on the open market?

A. Yes, sir.

Q. And I suppose they are bought by people from all parts of the country?

A. Yes, sir.

Q. So that the money does not come from any particular part of the country?

A. They are all clients of the house.

Q. They are scattered all over the country?

A. Certainly.

Q. So that *that* the actual money that finally goes into the stocks and bonds of the industries of the country is furnished by the investing public generally?

A. It is furnished by them through us. The money that comes in is furnished by us and we turn around and retail that out to other people. The money would not come directly from these investors, the United Gas Company of Des Moines could not reach these people we reach.

Q. There are very few public service corporations either in Iowa or anywhere else that you know of where the money for the promotion of the enterprise is furnished locally at the time of the organization and development of the property?

A. Yes, that is true.

Q. That money as a rule always, everywhere, in Iowa and everywhere else is secured in the first instance through just —
1966 concerns as your people are operating at Chicago?

A. We only furnish a part of the money on first mortgage security. Other concerns furnish and finance it all.

Q. You furnished part of the security and there are other houses dealing in stocks and they furnish another part of it, that is true isn't it?

A. They usually furnish it all to begin with and then come around and reimburse themselves by borrowing part of it from us.

Q. As a matter of fact, promoters and people organizing these affair- do it on somebody else's capital.

A. They have to put their own credit back of it. Oftentimes they do it on their own capital?

Q. The money comes as a rule just through such concerns as your house and then the other houses that deal in stocks and speculate in securities of that kind?

A. To a considerable extent the stocks are put in the hands of investors, yes.

Q. You said something about the return, you thought first there ought to be a return of six per cent anyway on the money invested?

A. Yes, that is about—we buy first mortgage bonds on the prop-

erty where the element of risk is largely eliminated on about a six per cent basis. If five per cent bonds we discount so it results in about a six per cent basis. I did say six per cent if that is what you want to know.

Q. Were you then referring to Iowa or generally, was that your opinion generally no matter where it was, Iowa Illinois, or anywhere else?

A. All throughout the west generally. Perhaps down in New England and Massachusetts might get a little less, I don't know.

1967 Q. You said in addition to the six per cent there were some other things that earned a return besides money. What were the other things?

A. There ought to be an allowance for the risk due to the character of the investment.

Q. Yes I will agree to that. Now what other i-ems?

A. Ought to be an allowance for profit or management or something of that s-rt.

Q. In addition to the six per cent?

A. In addition to the six per cent, yes.

Q. Who manages public service corporations?

A. I stated on direct examination that the properties throughout the *company* were necessarily drifting into the hands of people — experience and large financial means.

Q. They get their pay *b*out of operating expenses of these concerns?

A. No, not at all. They have got to furnish money and they have got to stand sponsor for it originally.

Q. Then your idea is an investor in the stock of one of these public sorporations in addition to the salary that is paid to the managing officer is entitled to some additiona- sum.

A. The stockolders are really in control of the property but in nearly all companies except in the very small companies the stockholders consist of men who are experienced and who are able to make money out of the property by reason of their experience and financial strength, would not care to put their money in or have anything to do with the property if they could not make that profit.

Q. The stockholders in this concern about which this controversy is being had all live in Philadelphia, they don't any of them live in Iowa.

1968 A. That is an illustration of what I have been trying to say. The fact it takes concerns like the United Gas Improvement Company to furnish money to carry on these properties.

Q. What are they entitled to in addition to reasonable interest on their money?

A. They certainly would not be interested I presume—in every case the United Gas Improvement Company and people of that character who spend all their lives working up a business of this sort would not be interested in just getting six per cent return on it because they can invest their money at that rate and not take any

risk and have no work to do nothing but clip coupons every six months.

Q. Suppose the United Gas Improvement Co. should own this property and are getting a constant steady regular return of six per cent upon every dollar that goes into the property, wouldn't you consider that a profitable property, security that was paying satisfactorily?

A. I would not buy it on that basis if I had money to invest, no sir.

Q. What does your house charge for commission on these bonds and stocks that you handle?

A. Well we figure that we ought to have on handling first mortgage bonds on a property for nothing more than first mortgage bonds and placed directly to the investor on a million dollars feel we ought to have $100,000. Ten points profit for buying bonds and selling them.

Q. Suppose you were to take over an issue of the bonds of Des Moines drawing say, four and a half per cent interest?

A. You mean city of Des Moines?

Q. Yes, city of Des Moines. A $100,000 issue, what would
1969 you charge or expect to get?

A. Municipal obligations of the city of Des Moines about one or two per cent we figure.

Q. So one or two per cent in a case of that kind you think would be plenty for what your house did in the way of handling the securities.

A. Yes, no risk or liability, no trouble about it. One and one half per cent on a municipal bond, that would figure ten per cent on a corporation bond.

Q. All kinds of corporation bonds?

A. I mean bond- of a corporation like the Des Moines Gas Company, bonds of that character. We sometimes make considerably more than that.

Q. So it is quite a profitable business if you have a large volume of business.

A. Yes, but a good many houses have gone broke however. If you -re successful in keeping out of failures, if it is all profit and no loss it is a pretty fair business. Unfortunately it does not happen to be that.

Q. Your house I understand is getting along very nicely in that respect?

A. We have made some profit and we have sustained some losses, but we are still in business.

Q. Without going any farther into that, just another question or two. You stated here a moment ago that you thought that a rate of ten per cent would be necessary in order to attract, that is a net per cent of ten per cent would be necessary in order to attract capital to an enterprise to the city of Des Moines. Now did you mean that?

A. I meant that a company ought to be earning over and
1970 above its operating expenses and fixed charges ten per cent on the value of the property adding going value and all that sort

of thing, fair valuation of the property it ought to be earning ten per cent over depreciation in order to make its securities attractive, yes.

Q. What do you mean by fixed charges, interest on bonds?

A. No, I mean ten per cent over operating expenses taxes and depreciation sufficient to keep the principal of the investment unimpaired. Ought to be ten per cent applicable to be distributed to the owners of the property whether they are bondholders or stockholders or what?

Q. Your notion is to make it attractive there ought to be at least ten per cent to distribute to the stockholders in the form of dividends to make it attractive to capital.

A. If it were all stock it would all be in the form of dividends. If you make that the Des Moines Gas Company I would say that even at that basis under existing conditions it would not be attractive if the conditions as to the laws of the state and franchises and the situation is favorable I should say that.

Q. What difference would it make what the laws are if the net earnings are ten per cent right along, make no difference what the laws are?

A. If you could guarantee net earnings of ten per cent.

Q. Well if it had been that right along?

A. It has been that in Des Moines?

Q. I am not asking about any particular company. But if the earnings have been that over a long period of years——

A. Well what they have been does not interest an investor so much as what they are going to be.

Q. Do you have any idea what the stock of a concern
1971 would be worth in Des Moines that was netting 10 per cent over and above all those items?

A. If it were all stock and net earnings of ten per cent they probably would not pay that all out, leave something against a rainy day, something for some surplus and I should say stock in that company ought to be worth par.

Q. Ought to be worth a good deal more than par wouldn't it?

A. I don't see why it should be. If you are limited to ten per cent a great many companies earning ten per cent only sell at a premium because of the probability that they will earn a great deal more than ten.

Q. So they would have to be earning a great deal more than ten in your judgment to be worth more than par.

—. I don't know as I would say a great deal more; have to be earning more or a likelihood of it.

Redirect exaination by N. T. GUERNSEY, Esq.:

Q. You were asked about a hypothetical proposition made by your concern to the city of Des Moines to loan money on the securities of the Des Moines City Railway Company. Now as a matter of fact the proposition made was to sell to the city of Des Moines the stock of the Des Moines City Railway Company and the stock of the inter-

urban railway company for bonds of the city of Des Moines which were direct obligations of the city, but without going into that I want to ask you whether you are familiar enough to know whether this proposition was made without getting out of an unsatisfactory investment or for the purpose of making a new investment in Des Moines?

A. It was made for the purpose of getting out of an unsat-
1972 isfactory investment and our experience in the street railway is one of the things that leads us to keep out of the state of Iowa.

Recross-examination by H. W. Byers, Esq.:

Q. I thought you told me you had not followed the city street railway proposition and didn't know about it?

A. I said it dragged so long, first the city was going to condemn then going to buy and then going to grant a new franchise and the last it was going to have a proposition to buy the stock for bonds of the city. You asked me I think what the rate of interest was on that sort of thing and I told you I didn't recollect.

Q. You say that the offer to take the Des Moines city bonds was for the purpose of getting out of Des Moines. Now after that opportunity your company did buy the stock in this company didn't it so they could stay in?

A. Our company didn't do it. Mr. N. W. Harris took over a large investment in it.

Q. Isn't Mr. N. W. Harris a large owner of your company?

A. Mr. N. W. Harris is the principal stockholder in it and did buy out the local people closer to the situation than Mr. Harris and a little more sick of it than he was because they had it every day and he only got it every six months or so.

Q. Instead of fixing it up to get out of Des Moines then Mr. Harris fixed it up so as to get in further.

A. No, he simply, I think he was going to take a chance on the thing working out fairly and I think it is going to. Attorneys advise him he has a perpetual franchise and got the five cent fare, I think he could stand it for a long pull probably.

1973 Q. I think he could too if he has that. About how much stock was included in that purchase of Mr. Harris after you say they wanted to get out of Des Moines?

A. I don't know how much.

Q. About how much?

A. I don't know sir.

Q. A million?

A. I don't know.

Q. Have no idea?

A. No. I have forgotten what the amount of the holding was. I know Mr. Harris has nought some stock at different times. Just what he bought, or what he paid for it, I don't really know.

Mr. Guernsey: I don't think what he paid for it is material here.

Mr. Byers: I am not asking that.

Mr. GUERNSEY: I can tell approximately what per cent he bought.

A. My recollection is he had about sixty and bought about forty. Mr. Guernsey is familiar with it, I am not.

Redirect examination by N. T. GUERNSEY, Esq.:

Q. Is that one of the illustrations of what you have referred to as conditions which require a man to keep putting in in these propositions instead of permitting him when he wants to to withdraw from them?

Objected to as leading, suggestive and not re-examination.

A. Yes, sir.

Witness excused.

1974 HAROLD ALMERT, being called on the part of the complainant and sworn and examined in chief by N. T. Guernsey, Esq., testified as follows:

Q. Where do you reside?
A. Chicago, Ill.
Q. And what is your business?
A. Engaged in the examination and reporting on public utilities and purchase and management of public utilities.
Q. With what institution are you connected?
A. H. M. Byllesby & Co., Chicago.
Q. I wish you would state so we get it in a concrete instead of an abstract way and that the Master will understand it clearly what business H. M. Byllesby & Co. are engaged?
A. H. M. Byllesby & Co. own and operate public utilities such as gas electric light, street railway, telephone and water companies in something over ninety cities and towns in the United States. They also have a department which designs and supervises the construction of this same class of properties for others and my particular department is the work for examining and reporting upon this same class of property which are in trouble physically and financially or both and also in the examination and purchase of this class of properties for H. M. Byllesby & Company.
Q. How long have you been engaged in this business?
A. Directly in what I have just stated or beginning in the public utility business.
Q. Well beginning in the public utility business?
A. Nineteen years in September.

1975 Q. How long have you been engaged in this business of buying and selling or connected with the business of H. M. Byllesby & Co., you have referred to?
A. I was engaged in the same class of business before going with H. M. Byllesby & Company and been engaged in it with H. M. Byllesby & Co., for three years and for six years previous to that.
Q. In what portions of the United States have you had experience in these matters?

A. In every section of the United States, but principally west of Chicago.

Q. Does H. M. Byllesby & Co. in connection with this business have anything to do with either acquiring or selling the securities of public service corporations?

A. They handle securities on their own properties, such property as they own and operate themselves but do not deal in securities or properties that are not owned by themselves or operated by themselves.

Q. I wish you would state how the money for investment in these public utilities is secured.

Objected to as incompetent, irrelevant and immaterial.

A. We have projects brought us from almost every conceivable source, local people in various states who have new projects they want to build and going to their local bankers and advised by them to come to us. Others find their way directly to us without going through any banks or through their lawyers and if after a statement of what the possibility of their project is it looks sufficiently interesting we send out our engineers to make an examination of the conditions as they exist to see whether or not the project looks
1976 feasible and if it is going to look profitable and if so we undertake the financing of it and the designing and construction and operation of the property. That is we put up our own money for the preliminary work that is necessary of engineering and making surveys and plans and specifications, preliminary reports and undertake the underwriting of the project and put in our own money either all or in part depending on the size of the project. If it is not too large we put in all our money until the proposition is a going concern with sufficient earnings to interest bond houses. If the project is too large for us to finance in that way we secure a loan from banks or trust companies who give us sufficient money to take care of the proposition until it is a going and earning concern and dispose of blocks of this underwriting to banks, bond houses and a small portion of it to individual clients of ours who are in the habit of investing in that class of investments.

Q. Before I forget it do you go into these enterprises if they do not promise any profit, but simply promise you a chance to get your money back?

A. Certainly not.

Q. Now what is it that induces you to go into these enterprises and put your money in and to incur the risk that your money won't come back?

A. The opportunity to make a sum of money in addition to what we might earn by investing that money in a class of securities or in a class of investment which would be absolutely safe and require none of our time and attention or ability.

Q. Now Mr. Almert, will you tell us whether you know what return is necessary under favorable conditions to attract capital in this general locality into these public service enterprises, I don't ask you how much, but whether you know how much?

1977 Objected to as incompetent, irrelevant and the witness not shown competent to testify with respect to conditions in Des Moines.

A. I do.

Q. I wish you would state in your judgment what is the minimum return which is anticipated, which is necessary in order to attract capital into such enterprises.

Same objection.

A. Before stating that I would have to know the conditions under which——

Q. Under favorable conditions? I intended to insert that into the question.

Same objection.

A. Ten per cent or over.

Q. Now what is the fact as to whether this return, that is the return which would be necessary to attract capital is a variable factor and if it does vary I wish you would explain some of the things you take into consideration in the actual practical determination of some of these questions of investment in solving this question.

Objected to as immaterial and incompetent.

A. It varies with our estimate of the hazards surrounding such an investment. Do you want me to name the hazards?

Q. In a general way, yes, explain what the things are you take into account?

Same objection.

A. We would first expect a return such as we could get without any attention and which was the general revailing rate. In addition to that we would determine the hazard there would be as to the length of franchise, possibility of renewing the franchise on
1978 its expiration without election and without serious concessions upon the provision of favorable rates during the length of that franchise and upon the conditions of the earning capacity of the people living in that territory to pay such rates, in other words what the traffic will bear and its competition with other commodities supplying the same field, if it was a gas business whether or not the electric light and other classes of light were in strong hands making low rates with vicious competition and w-ether or not the laws of the state as a whole were favorable to encourage investment of capital in that class, all these are hazards we would consider an aid to determining what the total return ought to be to be safe.

Q. You also take into account the community and the history or prospects for the future.

A. That is one of the principal things we consider and its growth and its history back as far as possible to determine what the probable growth in the future would be, that would be considered as one of the conditions and what the possible development per capita would be, etc.

Q. To put this a little more in the concrete, suppose you were to look over the city of Des Moines and you found it had a population here of something over 86,000 people, that it was growing steadily and seemed to be desirable so far as the historical features went and the prospects for the future as you could incur them from the past and then you found that under the laws of the state of Iowa a franchise could be granted for no period longer than twenty five years, and that there could not be in the franchise an agreement to extend it and that that would have to come up as an entirely new proposition at the end of the 25 year period, would that be a factor
1979 which you would take into account as affecting the desirability of the investment.

Objected to as incompetent and it is certainly irrelevant to any issue that is involved here, as the Master suggested the other day it might be relevant if the question involved was the reasonable rate, but no such question — involved here and — is irrelevant to the issues before the Master.

A. I would take that into consideration, yes.

Q. Now if you found that under the laws of the state of Iowa that a city granting a franchise could not agree with the grantee in the franchise upon what the rate should be there during the term of the franchise or for any term but that the city had the right to regulate rates at any time and such an agreement as I have referred to was expressly prohibited, please state whether or not that in your judgment would be a material factor affecting the desirability or attractiveness of the investment?

Same objection.

A. That would be a most serious factor.

Q. And would it add to or detract from the desirability of the investment?

Same objection.

A. Decidedly detract from.

Q. Suppose further in examining a matter you found that the laws of the state expressly prohibited the granting of an exclusive franchise for any term and that under the laws of the state the city had the power at any time either to start a competing plant or to grant to some individual or private corporation the right to start
1980 such a plant, please state whether those items would be factors in your judgment affecting the desirability of the investment?

Same objection.

A. They would.

Q. Suppose that further you find that under the laws of the state the city had the right at any time whether the operator resisted or not to acquire by condemnation proceedings the property of the company if one should be organized to go into the business here, would that in your judgment affect the attractiveness or desirability of the investment?

A. It would depend upon the safeguards that would be thrown around it and the basis on which the property would be acquired.

Q. Assume that the price is not fixed, the price is to be determined by condemnation proceedings?

A. It would certainly affect it.

Q. Assume that a gas plant were constructed here and its earning capacity develop- at a cost of 31 or 32 hundred thousand dollars and that under the laws as they existed, a franchise could not be granted for a period longer than 25 years, that no exclusive franchise could be granted, that no agreement could be made as to rates to be charged by the company, that the city had power to regulate rates, that the city had the power to establish a competing plant, that the city had the power to authorize either individuals or private corporations to establish competing plants, that the city had the power to divest the company of its property and cause it to make an involuntary sale of it by condemnation proceedings and assume further that under the laws of the state a corporation if a corporation was necessary to operate this property could not issue any stock that was not
1981 fully paid and could not incur any indebtedness in excess of two thirds of the amount of its outstanding capital stock, what would you say as to the amount of the return in excess of operating expenses including taxes and a sufficient amount to provide for depreciation that would be necessary in order to attract capital to such investments?

Same objection as to former questions.

A. I could not nor do I believe anyone else could estimate what would be a proper return under such conditions.

Q. Please state whether or not you think a prospective or estimated return of ten per cent would do it?

Same objection.

A. Certainly not.

Q. You have had some experience have you in estimating cost of building these properties, reproducing these properties?

A. Yes, sir.

Q. For how long?

A. Nine years.

Q. What do you say as to whether or not it is necessary in making such estimates to make an allowance for omissions and contingencies and things of that kind and if so how much?

Objected to as incompetent, immaterial, and not the subject of expert testimony.

A. It would depend entirely upon my knowledge of the engineer who made the original estimate. And would vary all the way from ten to 100 per cent, depending on the man who made the estimate.

Q. That is a broad field. I wish you would state what your experience has been in the matter and what your experience has demonstrated as to whether an estimate which does not allow for these matters is insufficient to cover actual cost of construction.

1982 Objected to as incompetent, immaterial and not the subject of expert testimony.

A. No estimate of the reproduction value of a property should be made without allowing a certain percentage for that item.

Q. And why? What has your experience shown about it?

Same objection.

A. My experience has shown that no matter how carefully an inventory is made and how careful an estimate is made of the reproduction value of the property there are many conditions which cannot be seen or foreseen and omissions are always made in making an estimate of that nature so that a minimum of ten per cent should be made at least in the cost of reproduction and in addition to that a liberal allowance should be made for the cost of piecemeal construction where property has been developed and built up over a long period of years.

Q. I wish you would state whether in your actual experience in building these plants you find it necessary to incur any expense on account of engineering and supervision and things of that kind?

Mr. BYERS: Oh that is so apparent I would not think counsel would want to take the time with it.

Mr. GUERNSEY: All right I will withdraw.

Cross-examination by H. M. BYERS, Esq.

Q. The mistakes in these inventories are always I suppose on the same side.

A. There are rare exceptions where an engineer over estimates.

Q. I am not talking about an engineer, I am talking about an invoice of property where you have counted the pieces, measured the buildings and all that sort of thing and where it is all carried
1983 out into figures your idea is the mistakes are always one way.

A. Yes, sir.

Q. And that is the reason that you would allow ten per cent.

A. At least.

Q. To cover mistakes. Now if you had a case where several engineers had followed each other on the witness stand and all testified that they checked up every item and every article and they chanced to find mistake of one brick—and we throw that early in this case, would you still say there ought to be ten per cent for omissions?

A. If they had not already included it in their estimates I would say so.

Q. They all swore they checked it up thoroughly and one man who was brought in as a witness with respect to the distribution system was so accurate and so certain of himself that he sat upon the witness stand and gave the number of miles of mains, the size of the mains, the streets upon which they were laid, the years in which they were laid and then boasted about not having made a mistake. You still ought to add ten per cent to the distribution system had you?

A. Yes, sir.

Q. Notwithstanding what he said about it?

A. Yes sir.
Q. That he hadn't missed a thing?
A. I would not say definitely ten, but ten or more.
Q. Ten or more is what you said about returns. What you meant on returns was ten per cent or as much more as you could get wasn't it?
A. You are shifting now to returns?
Q. To returns.
1984 A. Ten or more should have in a case where the hazards——
Q. When you say or more that means as much more as you could get ?
A. Not necessarily.
Q. Well how much more?
A. Depend on what these hazords were and what figure it would be necessary to have for taking that chance on?
Q. What difference would the hazards make if you are getting ten per cent. How much more ought you to have over and above that?
A. There are lots of conditions surrounding investments in this class of property which are such hazards that no sane man would invest his money for a prospect of ten per cent return only.
Q. I am just trying to get an idea of how much more you think would suit the ordinary individual that was dealing in that kind of property?
A. I would have to know the other conditions,.
Q. Suppose conditions were just as bad as they could be but still the property earned ten per cent on the investment now how much more ought you to have because the conditions are as bad as they can be.
A. That would put the investment in the speculative class out of our line and our company would not put money in under those circumstances.
Q. An investment earning ten per cent would be speculative in your opinion?
A. If you walify that by stating what the prospects of the future earnings would be and what safeguards would be furnished I can answer that question.
Q. Well just imagine the worst possible conditions you could, how much more ought you to have than ten per cent.
A. I should say there would not be anything sufficient to
1985 warrant a man to put his money into conditions the worst imaginable?
Q. Well Mr. Guernsey stated a whole lot of things here you said were very unfavorable. Now how much more ought you to have for these unfavorable things he referred to, how much more than ten per cent?
A. I would say I would not and our firm would not put their money into property of that kind under conditions stated.
Q. I say if you were going to put it in how much more should you have?
A. I can only answer that by saying he should not put his money in.

Q. Of course that is not an answer. You said a man ought to have ten per cent or more depending on the hazards and conditions. Now take the conditions he refers to how much more than ten per cent do you think a man ought to have?

A. I would say these hazards are too great so that I could not estimate how much in addition to ten per cent he should have.

Q. Now let me put this question to you. You of course have no interest in this law suit?

A. None whatever.

Q. You don't have any stock in gas properties?

A. Not in this one.

Q. Not in any gas properties generally?

A. I have in one.

Q. What one is it?

A. Up in Minnesota.

Q. What town?

A. Stillwater, Minn.

Q. The only gas company there?

A. Yes, sir.

1986 Q. How long have you had the stock?

A. Three years.

Q. What is the rate up there, what are you getting for gas up there?

A. $1.50 less discount scaling the rate down as low as $1.05.

Q. How big a town is Stillwater?

A. Stillwater itself only 12000 population. But we serve a number of surrounding towns at higher rates than that.

Q. When you -erve town- farther away you get more for it?

A. Yes, sir.

Q. Stillwater is about 12000?

A. Yes, sir.

Q. Are you just a stockholder or are you one of the managing officers?

A. Just a stockholder.

Q. You have no interest in any other gas properties?

A. No, sir.

Q. Does your firm?

A. Yes, sir.

Q. In a general way how large an interest, I don't want to inquire into private business, but in a general way?

A. They own the controlling interest in some thirty or forty of them.

Q. Then of course they are very deeply interested in maintaining rates, what you would call fair rates.

A. Fair rates, our commodity will not pay prices too high, you can't sell it.

Q. With that understanding of your relation to the gas business I want to put this question to you. I suppose you would be fair enough to say to the Master that conditions that reduced the value of the investment would also reduce the value of the prop-

1987 erty behind the investment wouldn't you?

A. As a going concern, yes.

Q. Mr. Guernsey called your attention to certain laws in Iowa from which you indicated there were hazards and the condition which you indicated would reduce the desirability or value of the investment. Now among other things you stated the statute which provides for the condemnation of gas plants in this state and now how far do you count that, to what extent do you count that a hazard to the investor?

A. Unless the condit-o*j*s of the contract between the public utility in question and the city or state as the case may be specifically provides the basis on which the property is to be condemned and taken away.

Q. Well that could not be done could it in a statute, the price or value of property could not be fixed in advance could it?

A. The basis of it could be fixed.

Q. And an investor would not want any more for his property than its real worth or value on the market where it was to be taken would he?

A. He is not any different from the average citizen in that respect but at the same time the experience has shown that the interpretation of a majority of -he statutes of that nature which are not sufficiently specific and the inadequate knowledge on the part of the public and city councils are such that in their estimation——

Q. Well there is no city council involved.

Mr. GUERNSEY: Let the witness finish his answer.

Q. So the fair price of condemnation would be the present value of the physical plant?

A. Well that might be your opinion about it. That is not
1988 my opinion but unfortunately this is general all over the country and where such things exist I would hesitate seriously to recommend the investment of our firm's funds where such general conditions exist and where they were not more specific.

Q. Don't the investor have exactly the same opportunity and same show with respect to the value of his property in the courts of the state as the people or city that is going to take it away? He is not entitled to any advantage in that respect is he?

A. In the testimony the burden of proof is put upon him and very expensive litigation necessary to prove it, he may be broke before he gets a chance to prove it.

Q. Isn't this what you mean and all you mean that a statute that provides for condemnation affects the security simply because it disturbs the permanency of the investment, that is that it may be taken away at any time, to that extent isn't that all the hazard there is in that kind of statute?

A. Not to my interpretation, my interpretation not only disturbs the permanency of the investment and as they generally operate you may not get a good fair price for the property when it is taken away.

Q. That assumes that the courts of the state are not going to do the right thing. In this state the law provides that in case of condemnation of property of this kind the value of the property shall be determined by three district judges and provides for their appointment by the chief justice of the supreme court as I remember it, or

the supreme court itself. In such a tribunal as that you would not ask that the investor had any advantage over the community would you?

A. Would not ask any advantage.

Q. No. Now another thing he included in his question the
1989 fact that the franchise could only be granted for twenty five years and that the city council had the right to fix rates and could not fix them to cover any particular period. You said that that would be a very serious objection and to some extent I am inclined to agree with you as far as speculative investment is concerned or so far as more than what we regard as a reasonable return upon money in this state is concerned. Now suppose that the situation was not only that a franchise could not be granted for more than twenty five years but here is a gas company that has not any franchi-e at all, not even for twenty five years and has no legal right so far as—I won't put it legal right, but has no contract right or franchise right to use the streets at all, would you say that would not only affect the value and desirability of its securities, but it would affect the value of its physical property wouldn't it?

A. Yes, sir.

Q. If your house was to send you to Des Moines as it undoubtedly from your testimony has sent you all over the country to look at gas properties both for the purpose of investing in them themselves and recommending other investors to invest, and you found a condition like that and you were going to advise with respect to the value of the property as a commercial transaction would you make a very great reduction on account of that condition, wouldn't you if you were going to advise the purchase of it at all?

A. You mean the condition that they had no franchise at all?

A. Yes, sir.

—. ——.

Q. Now Mr. Almert would it make any difference in the desirability or the value of the securities of a public service corporation if the securities did not exceed in amount the actual physical value of the property?

1990 A. Referring to bonds only and bonds and stocks.

Q. Bonds and stocks, take the securities generally?

A. The greater the value of the physical property back of the securities, the more valuable the securities.

Q. The security is much more desirable and will sell on the market with less difficulty and at a better discount rate if the securities do not exceed the actual investments in the property.

A. Not on that condition alone.

Q. All other conditions being equal of course?

A. All other conditions being equal?

Q. Yes.

A. You may have an immense plant several times too big in the territory.

Q. I am assuming you do not have any abnormal condition in that respect?

A. Yes, sir.

Q. Did I understand you to say that in your employment that you passed on securities?

A. I pass upon the properties themselves and estimate the amount of securities that are reasonable and safe.

Q. To carry?

A. Yes, sir.

Q. I don't suppose you claim to know anything about local conditions in Des Moines?

A. None whatever.

Q. Nor for what money is loaned for over the bank counter.

A. None whatever.

Q. Nor what securities sell for in Des Moines?

A. I do not.

1991 Q. Nor the value of gas stock in Des Moines or anything of that kind?

A. No, sir.

Redirect examination by N. T. GUERNSEY, Esq.

Q. Will you please state whether your company has ceased investing in these utilities in Iowa on account of these local conditions.

A. Yes, sir.

Witness excused.

1992 ANDREW COOKE being recalled for further cross examination by Hon. H. W. Byers, testified as follows:

Q. Do you have any interest in any gas property anywhere?

A. I have no interest, I hold no stock in any public service company.

Q. Do you have any financial interest of any kind in gas properties?

A. No, as a matter of policy I confine myself to the business I am in, believing I am better qualified to pass upon securities if I keep out of personal investments in the property themselves.

Q. Does your house—I am not sure whether you were a member——

A. I have an interest in the business if that is what you mean.

Q. Does your firm carry any gas bonds?

A. Carry gas bonds?

Q. Yes, for sale?

A. Yes, sir; a very large amount.

Q. So to the extent at least of the securities that they own and have sold they are to that extent interested in what you term a fair rate upon the sale of gas.

A. Yes, sir.

Q. Maintaining what you call fair rates?

A. Yes, sir.

Witness excused.

1993 W. J. HAGENAH being continued on cross examination by R. O. Brennan, Esq., testified as follows:

Q. We went over this table at page 43 of your report this morning to some extent on the annual investment on the 8 per cent earning basis, also in connection with Exhibit 26. I just want to call your attention to the first column of figures there for the twelve months ending June 30, 1887, and I want you to tell me what the book cost of the property was at the close of that year?

A. $308,776.60. That represents the cost of the property, the cost of the physical property at the close of the fiscal year ending June 30, 1887.

Q. That does not include working capital.

A. No, sir.

Q. Does that include the 8 per cent of depreciation?

A. No, sir; that is taken directly from the company's books.

Q. Well does that include the additions?

A. It includes the additions from year to year up to the end of the period, at which you are asking the value of the property.

Q. You start in here with the value of the plant twelve months ending June 30, 1887, $308,983.00. Of course that includes working capital.

A. Which figures are you referring to now?

Q. The first figure $308,983.

A. Yes, sir.

Q. Could you tell me what the structural cost or book cost of the property was at that time, the book cost of the property in 1887?

1994 A. The book cost of the property at the close of the fiscal year ending June 30, 1887, was $308,776.10. The figure which you referred to a moment ago of the fiscal year ending June 30, 1887, and then including working capital it is $308,983.

Q. At the close of the year then with the additions the actual book cost of the property with additions is $308,776.10.

A. This is the close of the fiscal year 1887.

COURT: That is the fiscal year, he asked about the year?

A. I have not the figures for the calendar year.

Q. It is for the twelve months?

A. Yes, but it is the fiscal year, not the calendar year.

Q. When does the fiscal year begin?

A. July 1st.

Q. This shows the book cost for the fiscal year ending June 30, 1887?

A. Yes, sir.

Q. Now if you had carried your table say to December 31, 1915, using about the same averages that you have used and keeping in mind the normal increase in business so as to ascertain the gross earnings have you computed what the value of the investment would be at the end of that period?

A. 1915, no I have not gone any farther than the actual time ending in 1910. I have not gone into any furture times. No estimation or speculation as to what would be the earnings or expenses for the future.

Q. You have not gone into that at all?

A. No, sir.

Q. Since 1906 according to your method of computation about what has been the increase in the value of the investment in round numbers?

1995 A. I worked that out yesterday I believe, but I have not the figures here now. I will add it again and subtract it again. I find here two figures which refer to our discussion yesterday and from that I compute that the increase in the cost of the plant since the Des Moines Gas Company assumed control up to the end of the calendar year 1910, was $810,360.

COURT: I find there was to the Des Moines Gas company under this table schedule 1, Exhibit "B" $1,117,655.89. Is that correct?

A. Yes, that is the figure I have here in the margin of my table.

Q. Then the difference between that and $1,928,016.65 is what?

A. It makes that. Makes $810,360.76.

COURT: I notice the figure $139.42 in red?

A. That is a year instead of being an actual addition to the property there was a net reduction in the cost of the property due to taking out of service certain property which had previously been charged to construction.

COURT: That you do not add in?

A. No, that is deducted.

Mr. BRENNAN: This 810,360 representing increase in value of the property since the Des Moines Gas Co. took it over would be shown on the books to be verified by the vouchers and records of the company would it not?

A. Yes, sir.

Q. And you did verify that much?

A. Yes, sir.

Q. You said this that there had been put into the plant through dividends or otherwise $810,360.65, do you?

A. Not as to what you state. I didn't verify any additions to property due to dividends. There were additions to property fue to actual expenditures for construction of properties amount-

1996 ing to $810,360.76?

COURT: Does that include money expended for replacement that you showed on page 36?

A. No, sir; this was eliminated.

COURT: None of that is in?

A. No, sir.

Mr. BRENNAN: This represents the amount shown by the books of the company that was actually expended in the plant. The books show that this amount was actually expended for construction of properties and you went over that to verify it and know that it was actually expended for that purpose.

A. I analyzed the construction account and found that money had been expended for specific construction purposes. There were vouchers and receipts showing expenditures and such charges were carried into the general ledger. I didn't go over to the premises to see whether there was in existence the specific piece of property

which the books showed had been charged to construction. I made merely the audit.

Q. You did satisfy yourself did you not from the vouchers and data in the office of the company that that amount had been expended?

A. Yes, sir.

Q. Covering four years.

A. Yes, sir.

Q. Except the $285,000, of course you didn't see a voucher for that?

A. There is no voucher for that.

Q. That is made up as you stated from verbal statements?

A. No, there is a charge on the books for $280,000 but it appears in the organization of the Des Moines Gas Co.?

1997 Q. And that you attempted to explain how it might have occurred and how it got on the books at that time?

A. Yes, and to the best of my knowledge how it did occur.

Q. Well you don't know anything about it personally?

A. I know there is a transaction on the books showing that property was turned over to the value of $280,000 represented by this charge, I know that the property turned over consisted of several specific classes, one million foot holder, one hundred thousand gallon oil storage tank, certain real estate and specific distribution property in Valley Junction.

Q. You know that from what has been told you?

A. Yes, in answer to my inquiry what this specific charge covered.

Q. As far as you are concerned it is absolute hearsay outside of the record on the books?

A. Yes, as to what the specific property it was, it is hearsay.

Q. You took pains to find out just what that item was, it attracted your attenion?

A. I just described how I went about it.

Q. You made a memorandum of the items which it was claimed had gone into the plant?

A. In that specific item?

Q. Yes.

A. Not any memorandum, I just gave you the four items, I didn't have to make a memorandum for that.

Q. You stated on yesterday in answer to one of my questions that there was no working capital or discount on bonds or accrued taxes, anything of that sort included in this——

A. I stated that there was no working capital in there, that as far as I knew there was no accrued taxation charged and while thinking of discounts in another sense I believe I stated that

1998 there was no discounts on securities charged to construction. Later on I corrected that and said there was a charge covering discounts in scattering amounts which I thought approximated about $75,000, might be a few thousand more or less.

COURT: A discount of $75,000 or on 75,000?

A. No the discount amounted to something in the neighborhood of $75,000 a little more or less. That is included in my table.

Q. You understood the question that was put to you did you not and you were asked this question you know there is no working capital or discount on bonds or accrued taxes or anything of that sort included. Ans. No, sir; only physical property?

A. I must have misunderstood your question because there would have been no object in my saying there were no discounts in there, that is why later on corrected it. I want to correct it now by saying there are these small discount items carried in the total about $75,000 more or less. That is my present statement in full understanding of what I thought you meant in your question.

Q. You didn't correct it until Mr. Guernsey asked you on redirect examination?

A. I spoke to Mr. Guernsey about it.

Q. I see from your cross examination on yesterday you were asked this question, did you include anything for discount on bonds. Ans. No, sir; not to my recollection. There was not any way by which you could have misunderstood that question was there?

A. That was correct as to my recollection at that time. That is why I am trying to correct it now.

Q. And after that you were asked this direct question, did not depend upon your recollection, there is no working capital or
1999 discount on bonds, accrued taxes or anything of that sort included. Ans. No, sir; only physical property.

A. I have explained my answer to that question.

Q. That is all the explanation you want to give?

A. That is all. I say it simply shows from that testimony that I find out that I did not understand that question at that time.

Q. Didn't understand the question put to you direct as to whether or not this item included discount on bonds?

A. I said I didn't know there was to the best of my recollection.

Q. When the direct question was put to you do you mean to say you didn't understand what was asked?

A. I understood what you asked but I didn't remember what you were trying to get.

Q. You said there only physical property didn't you?

A. I am telling you now there is a charge in there for discount.

Q. You said you carefully audited these books going over the period of five years, is that right?

A. I think so.

Q. Did you look up the securities that had been issued by the company?

A. I have a table in my report here of securities, schedule 1, Exhibit "G", Schedule 1, Exhibit "H".

Q. Do these show any discount on bonds Mr. Henegah, take for instance Exhedule 1, Exhibit "H"?

A. Yes, there was a discount on those bonds issued, that was the discount I referred to.

Q. Is it shown on this schedule 1, Exhibit "G" in Exhibit 23.

A. I think so. I don't see it now, it may be in there I would have to read it over carefully to find it.

Q. Can't you read it over carefully and tell us?

A. I have read it over and I don't find any reference to discounts in there.

Here the further hearing was adjourned until 9:30 A. M. Tomorrow.

2000 Thursday Forenoon Session.

AUGUST 10, 1911, at 9:30 a. m.

Counsel for the respective parties all present, except Mr. N. T. Guernsey.

Testimony on part of complanant resumed as follows:

WILLIAM J. HAGENAH, re-called for further cross-examination, examined by R. O. Brennan, Esq., testified:

Q. I believe, Mr. Hagenah, last evening we were discussing discounts on securities—that is as you remember it, is it Mr. Hagenah?

A. Yes, sir; I just finished reading a part of my report and come to the conclusion I had not shown in my analysis of the bond accounts any discounts.

Q. The bonds which you set out in Exhibit 23 and the history of the bond issues shown therein do not show any discounts?

A. They do not show the market price at which the bonds were sold.

Q. But I understand you now say in answer to a question put to you by Mr. Guernsey that in this report you have incuded discounts on securities?

A. Yes, sir.

Q. And that represents a part of the value of the investment as determined by you by this method?

A. No, sir, it represents a part of the cost as shown by the books.

Q. That is, part of the $1,928,000?

A. Yes, sir.

Q. Well, now, you take some of these items, I would like to have you separate the discounts, taking these twelve months ending February 28, 1907, if there were any bonds sold during that year, and tell us just how much is included for discounts on securities??

2001 A. You are referring now to schedule 1, Exhibit B, of my report?

Q. Yes, schedule 1, Exhibit B, and Exhibit 23.

A. I can't separate that, Mr. Brennan, for any particular year, but I can tell you the total amount of discounts charged to construction since 1907, up to and including 1910.

Q. Beginning the first day of March, 1908?

A. 1906—during the life of the Des Moines Gas Company?

Q. All right; well commencing then with February 28, 1906 and up to and including the year 1910, tell us how much of that amount represents discounts on securities.

A. The total discounts on bonds charged to the construction cost of the physical property during the history of the Des Moines Gas Company until the close of the calendar year 1910, was $33,950.

The MASTER: Can you point out the bonds and the rate of discount?

A. Between the years, or rather between the months of October 1906, and December 31, 1910, the company sold $412,000 of par value, first mortgage, five per cent, twenty year gold bonds to reimburse the company, or the treasury for expenditures on account of construction. Of these bonds $267,000 was sold at the price of ninety; that is a discount of ten per cent, making the discount on that sale $26,700——

The MASTER: Is that the discount?

A. That is the amount of the discount, ten per cent, which is $26,700. $145,000 worth of bonds out of the total of $412,000 was sold at ninety-five, or a discount of five per cent, the discount in that case being $7,250. The sum of these two discount items equals $33,950. The reason I can't give the discount for any particular year is because the company does not sell bonds in small
2002 amounts to reimburse small construction items. The practice is to wait until there is an accumulation of indebtedness and then to issue bonds for the larger amount—it affords a better market.

Q. Now, Mr. Hagenah, do you remember, or have you any information as to when the Des Moines Gas Company sold bonds, during what year?

A. I don't know the last particular issue other than that the total bond issue during the dates which I gave amounted to $412,000. I don't know the date of the last issue.

Q. Well, do the books show that or is there anything in your report to indicate in this analysis of the bond account which you set out in Exhibit 23?

A. My report shows that the last sale of bonds in 1910 was under date of August 31, to the amount of $49,000.

Q. Do you know at what price the bonds were sold under that issue?

A. No, except that they went either at a discount of ten per cent or five per cent. I don't know in which group of classified sales that particular item occurred. No bonds during the life of the company were sold for less than ninety and the smallest discount was five per cent.

Q. Well, it would be important to know, would it not, in getting your book cost of the property inasmuch as you have considered discounts, to know the exact amount at which the bonds were sold?

A. Well, they went for either ninety or ninety-five. The total discount charged to construction during that period was $33,950.

Q. Is that the actual discount or average?

A. Actual discount.

Q. You can't separate and tell us, for instance, this bond issue under date of August 31, you can't tell us whether this sold for ninety or ninety-five?

2003 A. No sir, I can't.

Q. Would the company's books show that?

A. Yes, sir.

Q. You can furnish us that information, Mr. Hagenah, in connection with this report, Exhibit 23?

A. I don't know whether I can or not; the books show it.

Q. And the issue of date April 30, 1910, $32,000, at page 10 of your report, do you know at what price these bonds were sold?

A. I have to make *make* the same answer to each one of the individual items that is given in the report. The item I have given you represents the total discounts during that period.

Q. Were you furnished by the company at the time of making this part of your report a memoranda of the amount of bonds sold and the price at which they were sold?

A. No, sir.

Q. And when you were here going over the company's books, auditing the same, did you take a memoranda?

A. I took a memorandum of the total discounts, but not of the individual bonds issued. I did not make any classified analysis of each particular sale. I took the total of the sales; some sold at ninety and some at ninety-five, making the total discount that I have stated.

Q. Now, from your audit of the books of the company, did you find that any bonds had been sold prior to February 28, 1906?

A. Yes, sir.

Q. And can you tell us the amount of the issue or issues of the bonds for the period preceding the 28th day of February, 1906?

A. Those years cover the corporate history of the Capital City Gas Company. That company at the time it was ab*srob*ed in the re-organization resulting in the Des Moines Gas Company had
2004 a total outstanding bond issue of $400,000. These bonds were issued in the following manner: On December 31, 1888, the company issued $200,000 par value bonds to cover the construction of a water gas plant and patent rights incident to the use of such equipment. Under date of February 1897 $225,000 par value bonds were issued, dated January 1, 1897, and running for a period of ten years, of which $200,000 was issued to retire the $200,000 of bonds issued to cover the cost of installing the water gas apparatus and the costs incident thereto; and the remaining $25,000 to cover real estate expenditures. In October 1899 the company issued bonds to the par value of $73,000, which were dated January 1, 1897. These bonds were issued for cash to reimburse the company for construction and betterment expenditures. In April, 1901, the company sold bonds for cash to the par value of $58,000, the bonds bearing date of January 1, 1897, and were sold, like the preceding issue, to reimburse the treasury for construction and betterment expenditures——

Q. 1897?

A. They bore date of 1897 and issued in 1901. In January 1902, the company sold an additional block of bonds to the par value of $44,000, also to reimburse the treasury for construction expenditures; these bonds also bear date of January 1, 1897. The total authorized issue therefore of $400,000 is explained by these sales, of which $200,000 was issued to retire the preior and previous

issue of $200,000, $25,000 for real estate, and $175,000 was issued to reimburse the treasury for betterments. These bonds were all disposed of at par.

Q. No discounts?

A. No, sir; so I will have to correct the statement I made I think on two occasions yesterday, that I thought the discount charge
2005 in the construction account was about $75,000 a little more or less; I am wrong in that; it is only $33,950.

Q. These bonds dated in 1897 and sold in April, 1901, were sold at par, with accrued interest, at date of sale, is that your understanding?

A. That is the practice, yes sir.

Q. Is that what the books show?

A. I don't remember about that.

Q. That would be important to know.

A. It is on the books.

Q. Well, it may be. Your analysis of the bond record of the company, you would be interested in knowing whether bonds were sold almost four years after they were dated, you wouldn't expect the company if they were sold at par to get accrued interest as well?

A. You do not distinguish in your question between the date the bonds were authorized and issued.

Q. I understood you to say the bonds were dated in the year 1897 and were in fact issued or sold in 1901, four years thereafter?

A. That is the authority under which the bonds are issued; they bear the date of the general mortgage.

Q. Do the bonds on their face bear the date of the year 1897 and they were sold in 1901, four years thereafter?

A. My recollection is that if the bond does not carry interest during the time from its authorization to the date of issue, interest began after the date of issue.

Q. What I want to know, in your examination of the books and bond records of the company, what the fact is as to the date which these bonds bore?

A. I don't remember that, the actual fact, in this particular case.

2006 Q. So that you would now say in this table shown at page 5 of Exhibit 23 in all the items preceding February 28, 1907, that nothing is included therein to represent discounts on securities?

A. To the best of my knowledge nothing is included.

Q. To the best of your knowledge, now, that knowledge is based upon careful and painstaking audit of the books of the company?

A. Yes, sir.

Q. You satisfied yourself after a careful, painstaking investigation and audit there were in fact no discounts upon bonds and securities covering the period from 1896 to February 20, 1906?

A. I found none.

Q. Did you consider in connection with your report Exhibit 23 the amount of cash received by the company from the sale of stock?

A. No, sir.

Q. Did you consider it at all in connection with your report Exhibit 23?

A. No, sir.

Q. And in your audit of the books of the company, did you inform yourself with respect thereto in any manner?

A. Only as the amount of capital stock appears on the balance sheet.

Q. You accepted that as being the amount the company had received from the sale of stock?

A. That does not necessarily follow; I paid no attention to that.

Q. I want to know what you did?

A. I paid no attention to the amount of cash which the company received from the sale of its stock. The existence of the fact that a large amount of stock appears on the balance sheet does not indicate that a corresponding amount of cash was received.
2007 My audit was more particular to determine the cost of the property over a period of years, the cost of operating that property and the income from the company's operations, and a statement of its assets and liabilities at the close of the calendar year 1910. I did not analyze the cash items to show the amount received from the sale of stock.

Q. Now, Mr. Hagenah, in your report Exhibit 23, if I get your theory correctly, you have charged the consumers in arriving at the value of the investment eight per cent on practically all of these items that you include as representing the book cost of the property.

A. I do not do that.

Q. You didn't?

A. No, sir.

Q. In the one item $1,928,016.65 there is included the sum of $33,950 representing discounts on securities?

A. Let me understand you now. You say in referring to my table the table you have in mind is this exhibit of the construction cost?

Q. Yes.

A. I thought you referred to the investment value. I do allow eight per cent on my total shown in the table of my cost analysis.

Q. So that it is your notion that notwithstanding now that you have said the property according to your theory is one hundred per cent in all respects, that its stock is paying eight per cent dividend, that all extensions that are made and additional capital necessary therefor is earning eight per cent, that yet *yet* it would be necessary in financing the extensions, etc., and the issuing of bonds, to sell them at a discount, do you?

A. I cannot answer your question yes or no. You in-
2008 cluded in it several elements more or less inconsistent.

Q. Let me ask you this: The stock in the company which is paying eight per cent dividends annually and where it issues a five per cent bond, would you think that bond would have to go at a discount in order to find a market?

A. The rate of dividend paid by a company in itself means nothing. You must take into consideration the amount of capital stock.

Q. I know, but what you have done in this case, you have property representing the full value of the stock and the property which you have bonded or mortgaged is as good as new, worth one hundred per cent on the market, now you issue bonds to the amount of $400,000 on property of that character, that is worth $3,000,000 according to your statement, do you think it would be necessary in order to find a purchaser for those bonds to discount when they were earning five per cent?

A. I do not know what elements would be taken into consideration. I know the purchaser would analyze very carefully the financial market, and all the elements affecting value, the bond market, which market is almost as sensitive as a barometer——

Q. You have assumed that they would have to be discounted in making up your valuation on the investment?

A. I made no assumption; I took the facts from the books.

Q. Suppose that instead of paying five they were paying six, would that make any difference?

A. Yes, sir.

Q. What difference would it make?

A. You would get into one of two difficulties. The first one is that you have a higher interest obligation to pay; you- rate of return allowed in a rate case upon your investment, must be so much larger to take into consideration the higher interest rate;
2009 and the second difficulty which you would encounter would be, if I may refer to the ruling of the court in the case of Steinerson vs. The Great Northern Railroad Company where they eliminated the excess interest on the bond issue where the rate was precisely six per cent, as allowed by the court, you are confronted by an actual condition.

Q. You have assumed eight per cent as a reasonable return and you have guaranteed that for the purpose of this report?

A. I have not guaranteed it. I have assumed an eight per cent rate of return the capital under these particular conditions was entitled to.

Q. Haven't you charged the consumers of this community with this eight per cent return upon this property by capitalizing the losses?

A. Upon the entire investment computed in this way.

Q. Computed in this way, by that you mean you have capitalized all the earlier losses of the company?

A. I have capitalized the losses and credited with profits.

Q. You have included the working capital and that is earning interest?

A. Yes, sir—pardon me, in what sense?

Q. It is included in one of those columns, is it not, where you speak of extensions and improvements?

A. I mean it is entitled to the allowance of the same eight per cent the capital invested in physical property is—physical property plus capital represented my table.

Q. If there has been any mismanagement in the history of this

concern going back to 1886, you have capitalized that along with the other matters?

A. If there has been any. I don't know of any; if there
2010 been any I would have made an adjustment accordingly.

Q. You are assuming for the purpose of this report that there was no mismanagement?

A. I am dealing with the fact as shown by the books.

Q. Of course the books don't reveal any mismanagement, and yet you tell this court they were entitled to depreciation and did not charge it off and you have gone over the books and have charged a reasonable amount for depreciation?

A. Exactly, and because they do not charge off any depreciation. They are being penalizes by——

Q. I think you said that yesterday; I am calling your attention to that now; if there was any mismanagement, Mr. Hagenah, it is capitalized along with the losses?

A. If there was any mismanagement which I didn't get it would be included in the figures I used, but I found no evidence of it.

Q. You have assumed eight per cent as a reasonable return for the purpose of this report; I wish you would tell the court that being true, and the property being in the state of efficiency you claim for it by reason of your theory, why it is that in selling bonds earning five per cent it would be necessary to figure that you would have to pay at least $33,950 as discount on a $400,000 bond issue?

A. The discount on these securities is not of my making. It is a cost the company incurred which it could not avoid at the time it sold those bonds. It was a condition imposed upon the sale of the bonds by the money market and the condition of this property at this particular time and it was a necessary expenditure made in good faith.

Q. Now, that is an assumption on your part that it was all in good faith?

2011 A. I say the transaction was in good faith unless I found evidence to the contrary.

Q. I cannot reconcile your figures, that $412,000. I understood it that the first issue under date of December 31, 1888, was $200,000; and on January 1, 1897, $225,000 were issued to retire $200,000, and that left $25,000 and the company in October, 1899, issued $93,000 and *on* April 1901, $58,000 and then in 1902 $44,000.

A. You are speaking now of the Capital City Gas Company?

Q. Yes; was the issue of 1902 the amount of $44,000?

A. It was.

Q. Then we have $225,000; $73,000; $58,000; and $44,000 and that is $400,000 is it not?

A. Yes, sir; isn't that what I said?

Q. I understood Mr. Douthert to say it was $412,000.

A. $412,000 was the issue of the Des Moines Gas Company. You are referring to the Capital City Gas Company.

Q. Can you separate from the table in schedule 1, Exhibit B, the Valley Junction business and property?

A. I cannot.
Q. Do you know how much is included therein?
A. No, sir.
Q. Which represents the property and business in Valley Junction?
A. No, sir; I know it is a very small amount.
Q. The $1,928,000 includes this high pressure pipe line, does it not to Valley Junction?
A. I don't know of the existence of a high pressure pipe line. I am dealing with the figures on the books.
Q. It includes the real estate owned by the company in Valley Junction?
2012 A. That appears in the ledger.
Q. And it represents the cost of the company as shown by the books in laying mains and establishing their distribution system in Valley Junction?
A. Everything on the company's books which is a legitimate construction cost is in this table.
Q. There is no way by which you can separate those items or tell the Master the percentage of the amount included in Valley Junction?
A. No, sir.
Q. The books, of course, show, do they not, what was paid for the Valley Junction business?
A. An analysis could be made which would show all that.
Q. Do they keep a separate set of books of the Valley Junction business or is it all kept in the books of the Des Moines Gas Company?
A. It is kept in one general set of books.
Q. Isn't the Valley Junction account, construction account, separate from the Des Moines Gas Company?
A. No, sir.
Q. So you could not tell which was Valley Junction and which was property in the city of Des Moines by reference to the books?
A. Not from the analysis of the books; I would have to go into a detailed analysis of the individual authorizations and work orders and trace the disposition of the money and minor items. The total is very small which belongs to Valley Junction.
Q. Now, let us take up Exhibit 26, Mr. Hagenah, and referring to the depreciation, beginning with February 1906 of the Des Moines Gas Company, and I wish you would add the figures there commencing with the item $3,611. and using the figures to the bottom
2013 of the column so that you will get the total figures?
A. The total of the list of six figures, the last six figures showing depreciation at the rate of two per cent on depreciable property is $166,472.
Q. So that represents the depreciation for the five years?
A. Yes, that represents the estimated depreciation for the five years.
Q. Your estimate of the depreciation for the five years?
A. Yes, sir.

Q. Have you Exhibit 29 before you, Mr. Hagenah?

A. I don't know what exhibit that is.

Q. That is the exhibit of gross revenue and net return applicable to interest and profit for the five years ending December 31, 1910.

A. Yes, sir.

Q. Now, what do you estimate, or what did the books show that was written off for depreciation covering five years?

A. During the ten months ending December 31, 1909, as shown in the fifth column in that table there is a charge and the corresponding credit to property on account of depreciation to the amount of $264,108.78.

Q. $264,108.78?

A. $264,108.78 according to my copy.

Q. So that it exceeds this table, exceeds the amount written off for depreciation as compared with the amount which you estimate in Exhibit 26, by $97,636.78.

A. That is substantially the difference between $264,108. and $166,477.

Q. Well it exceeds the estimate for depreciation as made by you in Exhibit 26 by that amount; isn't that the fact?

2014 A. This particular charge exceeds the amount I estimated for depreciation over those years by substantially the amount which you have given.

Q. Now, you lose in Exhibit 26 as your estimate for the five years this $166,417 do you not?

A. Yes, sir.

Q. Now, then, in Exhibit 29, covering five years there is a charge off for $264,108.74?

A. Yes, sir.

Q. And in Exhibit 29, when you come to your final average or the average of profits you use the figures $117,291.68 and in order to reach that amount it was necessary for you to use the $264,108.74 in lieu of the figures $166,472. isn't that correct?

A. With this explanation——

Q. Just answer the question and then you can explain.

A. Yes, but Exhibit 29 is based upon an analysis of five years of the company's books; Exhibit 26 is based upon an analysis of the company's records for 29 years in which I estimate, and my estimate is set off against the actual conditions found on the books.

Q. That is, in 1909, was the first year in which you found any charge had been made for depreciation?

A. Yes, sir.

Q. So that Mr. Hagenah, if you had kept to the text and within the books, you would have had no depreciation at all except this item in 1909?

A. Yes; if I had not used my own estimate and had used the figure on the book, naturally I would not have put that item in there.

Q. What I mean is this: You say when I called your attention to the discrepancy between Exhibit 26 and Exhibit 29, first re-

2015 specting this depreciation account, your explanation of that now is that one is the actual records taken from the books,

as against one which is an estimate covering a five year period. Now my question to you is, had you in every case kept to the books and not gone outside of the books, and not attempted to substitute some notion you might have with respect to what the books should have shown, you would have no occasion to use depreciation at all in your report prior to the year 1909?

A. That is true, if I had been guided solely by what the company did in that respect, I would have had no other depreciation figure to use except $264,108.

Q. Now you would justify the manner of arriving at the general average profit shown in Exhibit 29 by the fact that you came to this charge in 1909 of this $264,000 and that you were bound by that, whether it was reasonable or unreasonable?

A. That is the statement of the company's books, that is all.

Q. Suppose it had been $500,000?

A. I would have shown it.

Q. You would have used it just the same?

A. As an auditor I would only show figures on the company's books.

Q. If you were going to tell the Master what the average profits were in the company during the five years, you would be willing to do that, notwithstanding the charge amounted to $500,000?

A. I would say to the court, as I would say now, this is a true record of what the company's books show to have been the different profits during the period in question.

Q. You have also undertaken by this report, Exhibit 29, to show to the Master that the average profits of the company for the five years referred to in this report were $117,291.68?

A. Yes, sir; I show that, and I hope I can convey to the
2016 court the impression that the condition in which the company's books now are and the manner in which it has been handling depreciation is an incorrect method; and in table 26 I want to show to the court what the actual condition of this property is and not what they thought it was.

Q. Mr. Hagenah, if you wanted to do that and wanted to be eminently fair with the court, why didn't you make another table showing what the average profit would be for those five years based upon your estimate of depreciation for the five years?

A. Because I could not figure profit without considering the element of depreciation and the cost of the plant. If this is the only item charged off for depreciation, it does not indicate in the slightest degree that depreciation has not taken place during the company's life to a greater extent than this one charge; it reflects merely that the amount charged off represents the best effort on the part of the company under its financial condition to recognize depreciation.

Q. I think you haven't understood the question. (Question repeated.)

A. Again I will say, if I wanted to show to the court that the actual profits as determined by me were as opposed to the charge on the books I would have to go back further and recognize the fact that nothing had been charged off for depreciation during the earlier

years and there was an accrued loss of a large proportion due to the fact that the plant had not been properly carried on with respect to the element of depreciation.

Q. That accrued loss you speak of would go into the capital account?

A. Yes, I think it should; I believe that is the proper way to do it.

Q. That is the way you figured it in this report all along?

A. Yes, sir; I think that is the proper way of handling it.

Q. What I want to know, Mr. Hagenah,—you wanted to
2017 illustrate did you not, by Exhibit 28, that the average annual profits of the Des Moines Gas Company for the five years preceding December 31, 1910, were the sum of $117,291.68. is that right?

A. Yes, sir; that is what the books show.

Q. That is what you wanted to illustrate by the books and your analysis?

A. I wanted to show to the court what the books show.

Q. And in doing that, instead of adopting the estimate which you had made in Exhibit 26, covering the five year period, you took this charge of $264,000 to represent depreciation, rather than the estimate which you had made in the table of Exhibit 26, isn't that true?

A. In making my analysis of the company's books I used the book figure. I wanted to show to the court that the books did not properly reveal the proper financial condition of the company for the purpose of this suit; therefore I made Exhibit 26.

Q. Then, Mr. Hagenah, the $117,291.68 was not in your judgment and according to the table in Exhibit 26 the correct average profits of the company for the five years preceding December 31, 1910?

A. I make no explanation in this table as to what my judgment is; this shows the condition of the company's books.

Last question repeated.

A. I cannot answer that by yes or no.

Q. Now, for the benefit of the Master and counsel I wish you would take this Exhibit 29 and instead of using this $264,000 representing depreciation, use the amount which you estimated for the five year period in Exhibit 26, and tell the Master upon that theory, what the average profits of the company would be covering those five years?

2018 A. May I ask a question in regard to that to see if I understand your question properly?

Q. Yes, sir.

A. Do you want me also to take into consideration the accrued loss up to this time?

Q. I want you to do this: I want you to take the depreciation which you have estimated in Exhibit 26 for the five years preceding December 31, 1910, using that as your basis in Exhibit 29 for the purpose of telling the Master what the average annual profits of the company was for the five years referred to?

A. You want a simple mathematical demonstration deducting a smaller figure from a larger for the five years. I can do that.

Q. I simply want it on the record.

A. (Witness calculates.) I have gone over that although I have not rechecked my work, I get an average according to that method of computation of $134,465.

Q. How did you get at that, Mr. Hagenah?

A. By taking the net return applicable to interest and profits for the year in question, without any allowance for the $264,108. which the company show- as its depreciation in 1909, and then deducting each year the amount shown in my Exhibit 26 averaging the total of those five numbers I get $134,465.

Q. So that by adopting your estimate of depreciation for the five years, we have a difference of something like $17,000 annually?

A. A difference of $17,000 but you have not recognized the accrued depreciation.

Q. You have recognized that in your estimate in Exhibit 26?

A. My estimate is based over a period of 23 years.

Q. But that would include a depreciation of five years?

A. Yes, computed over a period of 23 years.

2019 Q. That is the accrued depreciation for those five years?

A. When computed over a period of 23.

Q. For the five years?

A. As a part of the 23 years.

Q. That is the way you want to explain that?

A. Exactly.

Q. But it is a fact in order to arrive at your $117,291.68 representing profits, you had to weigh it down with $241,000 item which appeared on the books of the company?

A. No, sir.

Q. Instead of the estimate used by you in table 26?

A. I answer your question in the negative.

Q. You did arrive at $117,291.68 representing profits, by using the amount which the company had charged off on its books for depreciation, instead of using your estimate for the five years as shown in table 26?

A. Exhibit 29 is based upon the actual conditions.

Q. Can't you answer that question by yes or no?

(Question repeated.)

A. Yes.

Q. I wish you would refer to Exhibit 31, if you will?

A. I don't think I have a copy here.

(Is presented with copy.)

Q. Which is the table showing the working capital of the Des Moines Gas Company December 31, 1910? Now if you will go to Exhibit 23, and refer to schedule 1 in the statement of assets and liabilities, shown at page 3 of the report, in schedule 1, Exhibit 23, there is shown in the liabilities bills payable to the amount of $14,000; in Exhibit 31 in arriving at the total amount of working capital, $141,769.98. You only deduct accounts payable and make

no reference to the bills payable account, to which I called
2020 your attention; what explanation have you to offer for that?

A. Whether bills payable should be deducted is more or less of an open question; I have not deducted it in this exhibit.

Q. Why do you distinguish between accounts payable and bills payable?

A. Accounts are current obligations in the course of operating the company's business; bills payable represent money borrowed upon notes for a specified time.

Q. Mr. Hagenah, didn't I call your attention a day or two ago to one of these balance sheets of the company for the purpose of having you illustrate to the Master the method by which you arrive at working capital and the computations which you made in that time, did you not include bills payable?

A. I remember we discussed that; I think in that analysis you wanted me to make, I deducted $14,000, that is my present recollection.

Q. So that in order to have the working capital of the Des Moines Gas Company amount to $141,769.98 as of December 31, 1910, you were obliged to omit the liability account or bills payable?

A. The working capital I analyzed in two ways. In one case I deducted it and in another case I left it in. It is open to question whether it should be put in or not. In my table computing the investment value I tried to be very conservative; it may be I have gone too far; I have tried to be what you call eminently fair, in arriving at that valuation I deducted $14,000 making the net working capital $128,000.

Q. What is your understanding of the term current liability?

A. It includes account- payable and may include bills payable, but you would have to see the bills before you knew. You
2021 can borrow money for a very long time in the form of notes which would in time assume some of the characteristics of bonds.

Q. Oh, yes, if it ran long enough; but ordinary bills payable now——

A. If you will tell me now what you mean by bills payable?

Q. You have said that you audited the books of the company and told the Master, strictly in accordance with the rules adopted by the American Gas Association, or some other association, and that you find on these books as you have set out here, accounts payable and bills payable; I want you to tell the Master just what bills payable are; I don't want you to answer the question by asking me one.

A. I didn't ask you any. In this case the $14,000 represents money borrowed to tide the company over a period when they needed ready cash; just what that $14,000 was devoted to I don't know.

Q. You don't know whether it was notes running five years or two years?

A. It represented notes; I don't know the length of time.

Q. Borrowed at a local bank?

A. I don't know that.
Q. Or what rate of interest the notes bore?
A. I don't know.
Q. You don't know where the money was borrowed?
A. No, sir.
Q. It was an obligation of the Des Moines Gas Company?
A. Yes, sir.
Q. You didn't know the payee of the note?
A. No, sir.
Q. You don't know when the notes matured?
A. No.
2022 Q. Do you know whether the notes had been extended, the time of payment had been extended?
A. No, sir; I didn't inquire about that.
Q. And yet, when you came to estimate the working capital you assumed that these $14,000 are carried under bills payable should not be deducted?
A. I have not deducted them in this table.
Q. You call that current liability, wouldn't you?
A. I can imagine conditions under which the bill would be a *a* current liability. I have seen a good many bills, notes I would without hesitancy call current liabilities.
Q. Is it not fair to assume, Mr. Hagenah, if it was money which the company borrowed temporarily for tiding it over some financial condition, that they had gone to one of the banks of the city, a national bank of state bank, or savings bank, and executed its note and that the banks as a rule, according to the witnesses, some of them that testified here, short loans running sixty to ninety days, not exceeding six months, isn't it fair to assume that the note, considering your explanation of it, the notes were of such character and properly chargeable to the bills payable account and should be deducted from the amount here as shown in working capital?
A. I make no such assumption.
Q. Have you not the right to assume that in the absence of anything to the contrary, and in the absence of any analysis by you of the notes, when executed, when they matured, and all the other facts and circumstances, any prudent business man would inquire and the way you did it in your testimony in this case?
A. I did not make any assumptions; I did not want to assume any condition——
Q. You never assumed anything when it seems to be
2023 against the company in this case, isn't that true?
A. It is not.
Q. You have assumed here, for instance, Mr. Hagenah, that this $285,000 that we have been speaking about so many times, you relied upon information furnished you without a stroke of the pen on the books, and you have assumed it was a fair purchase price for the holder and things of that sort, and you assumed for the purpose of having your average profits for the company, that this $264,000 was a proper charge to depreciation and all those things, and now when it comes to the question of $14,000 represented by

notes of the company which you say were given to tide the company over some temporary financial embarrassment, that you cannot assume that should be properly charged into the bills payable account?

A. You have got three distinct elements in that question which I can answer better one at a time.

Q. I am simply calling your attention to the matter and the condition of your testimony so that if you want to explain to the Master why it is under the circumstances that you were not willing to assume that these notes were not properly in the bills payable account, you may tell him?

A. I am not willing to make any assumption in the absence of fact to give me a basis.

Q. Do you want to say now that you have made any assumptions in your entire report or these tables which you have introduced here in respect thereto?

A. Not at all; that is an entirely different matter.

Q. So that you do make assumptions once in a while?

A. Indeed, I do make assumptions; but here is one I don't make.

Q. And that is the case when it affects the company to the
2024 extent of $14,000?

A. If you will refer to Exhibit 26 I can again show you the working capital I used where it was material to arrive at the present value of the investment for rate making purpose, including the allowance for rate making, in which I gave the public the benefit of every doubt and using $128,000.

Q. Don't you honestly believe that $14,000 since your attention has been called to it, as an expert statistician, and a man who wants to be fair to the public, don't you really believe that belongs in bills payable?

A. I have no information upon which I want to base the belief and I want to be fair and do not express any opinion.

Mr. BRENNAN: I think that is all. I want, however, if your honor please, I want Mr. Hagenah to produce for us before he is finally excused the following matters in connection with his report, Exhibit 23, and the various tables which have been introduced in connection therewith, first, I want him to produce the vouchers or statements showing the exact cost of all items entering into the $285,000 to which we have called his attention; second, a list of all discount on bonds charged into the cost of investment—I guess that has been given us and we will not bother further with that; third, the cost of all land as it appears on the books of the company; fourth, his analysis of all the construction costs of the past five years to show how much overhead was charged in the operating expenses and how much into construction. Copies of all balance sheets since 1900 and the deduction of working capital in each balance sheet. We also want the balance sheet of June 30, 1886, and we want the witness to produce a statement of the discount and sales of
2025 bonds in the year 1910 showing the discount in each sale.

Mr. GUERNSEY: With reference to these matters, we have no objection to the witness doing whatever work the city wants him

to do. We want it distinctly understood so far as we are concerned that it is not done for us, and not something we pay for. These books are now being examined by the city and everything they have asked for here they have had ample facilities for obtaining for themselves. So that we have no objection to their employing Mr. Hagenah to do it, but we distinctly decline ourselves to employ him to do it.

The MASTER: His time as a witness is going on anyhow.

Mr. GUERNSEY: We want distinctly to make the proposition that we are not bound to do this work for the city where we furnish the things with which they can do it themselves.

Mr. BYERS: It is immaterial to us.

The MASTER: If there is going to be any question about it we will have the books brought in.

Mr. GUERNSEY: They have the books.

Mr. BRENNAN: In the nature of things, in view of this witness' testimony in this case—the witness will say the books show this together with his analysis; many things include his analysis and we could not take these books in view of his testimony in this case and analyze his theory for instance of overhead charges. He has introduced this Exhibit 23 and he has supplemented the books by this analysis; if this exhibit is going to be considered in this case, we want it to be considered in the light of the analysis he makes.

The MASTER: I do not understand that he has any over-
2026 head charges in this case.

Mr. GUERNSEY: I would like to have the record show with reference to these vouchers; these are vouchers which have already been offered to the accountants of the city and are now subject to their examination at any time.

Mr. BRENNAN: We want it to appear of record that our accountants have not been furnished the vouchers to which reference has been made.

Mr. GUERNSEY: Mr. Douthirt tells me these are not the vouchers: that there are no vouchers and that Mr. Bemis, when he prepared this memorandum was advised of that fact.

Mr. BEMIS: I supposed they were in Philadelphia.

Mr. BYERS: We will stand on this record; if they are satisfied with it, we are; our request is there.

The MASTER: I do not care to have them produce something they have not got.

Mr. BYERS: They can make their showing if they haven't got it.

The MASTER: You testified there wasn't any vouchers.

The WITNESS: I testified a number of times there were no vouchers covering the disposition of the $285,000.

The MASTER: You simply found the charge on the books?

The WITNESS: Yes, sir; at the time of the consolidation.

The MASTER: That eliminates that so far as this witness is concerned.

Mr. BRENNAN: We are making this request in the utmost good faith. This testimony shows all this work was first done on requisition on Philadelphia and authorizations were issued and the work

was done under the authorization, and the vouchers are presumably, in some instances at least, sent to the U. G. I. office. Be-
2027 cause they were not handed to this witness or did not appear on the books does not support the fact that they are not in existence.

The MASTER: This witness will not be required because he never had them and consequently you cannot require him to produce them.

Mr. BRENNAN: We ask him to produce the cost of all lands as appears on the books of the company.

The MASTER: That means produce the books.

Mr. GUERNSEY: We will produce the books if they wish to have them.

The MASTER: Now, what else?

Mr. BRENNAN: And the analysis of the construction cost of the last five years to show how much overhead was charged into operating expenses.

Mr. GUERNSEY: That is something he has not done. It does not appear on the books. It is a matter of independent work. We are perfectly willing to have the witness do it, but it should be done at their expense and not ours.

The MASTER: I understood all the time there were no overhead charges included. Were there any overhead charges in the books?

The WITNESS: No, sir, I found none.

The MASTER: What next do you want?

Mr. BRENNAN: Copies of the balance sheets since 1900.

Mr. GUERNSEY: Those are all in the books these gentlemen are now examining.

The MASTER: What next?

Mr. BRENNAN: The balance sheet of June 30 of 1886.

The MASTER: That was taken from the ledger I under-
2028 stand, and the witness can be examined as to that. I think it very proper that the ledger should be here.

Mr. BRENNAN: Defendants interpose the further objection to the introduction of Exhibits 23 to 31, both inclusive for the reason that it appears that said exhibits are based upon an analysis made by this witness from memoranda and other matters furnished to him and investigated by him and that the same has not been produced in connection with the request of the defendants.

Mr. GUERNSEY: Do you refer to the requests you made on the record here?

Mr. BRENNAN: Those requests are on the record and a full discussion has been had.

Witness excused.

ARTHUR REYNOLDS, being first duly sworn on part of Complainant, examined in chief by W. L. Read, Esq., testified as follows:

Q. Where do you reside?
A. In this city.
Q. How long have you lived here?
A. Sixteen years.

Q. In what business or occupation are you engaged?

A. Banking.

2029 Q. How long have you been engaged in the banking business?

A. Twenty-five years.

Q. For the past sixteen years in Des Moines?

A. Yes, sir.

Q. And prior to that where?

A. At Panora.

Q. With what bank are you connected?

A. The Des Moines National Bank.

Q. What is the capitalization of that bank?

A. Five hundred thousand dollars.

Q. It is a national bank?

A. Yes, sir.

Q. Doing a general banking business?

A. Yes, sir.

Q. What official relations do you have with the Des Moines National Bank?

A. I am President of the Des Moines National Bank.

Q. Are you in active charge of its affairs?

A. Yes, sir.

Q. And have been during the years you were connected with it?

A. Yes, sir.

Q. Have you acquainted and familiarized yourself with the current rates of interest that are being paid in this vicinity?

A. Yes, sir.

Q. What are the prevailing current rates of interest paid upon first class real estate securities, such as first mortgages on agricultural lands, where the amount of the mortgage does not exceed, say fifty per cent of the value of the land, in this vicinity and locality?

A. I would say six per cent.

2030 Q. What were the rates about the first of January this year?

A. Six per cent approximately.

Q. What do you say as to how long such rates have prevailed?

A. Rates generally on farm mortgages have been six per cent for something over a year; probably a year and a half.

Q. What is and has been the prevailing rate of interest usually required and received upon money invested in the banking business?

A. You mean by that how much has been received as dividends or how much total profit?

Q. Total profit without regard to whether it has been distributed into dividends or not.

Objected to on part of the defendants as wholly incompetent, immaterial and irrelevant.

Q. Available for dividends or surplus?

Same objection as last above made.

A. Of course that profit varies very materially in different institu-

tions and with different investors; but the rate of income on an investment of that kind would probably net somewhere between eight, twelve and fifteen per cent.

Q. Is the banking business regarded as a conservative and safe one in this community by the industrial public?

A. I think so, yes sir.

Q. Where does it rank in that respect?

A. Well, I would say it is one of the foremost business- of the town, a conservative class of business.

Q. I assume that it would require to induce the investment of capital in the banking business something more than the rate that would be paid on first class real estate securities?

A. Yes, sir; I think it would.

Q. And in order to induce investment of capital in the banking business rather than its loaning upon real estate securities,
2031 how much of a net earning available for dividends or surplus would be required?

Objected to on part of defendants as incompetent and irrelevant.

Q. State the minimum, if you please.

Same objection last above made.

A. I would say anywhere from two to four per cent, a minimum probably of four per cent.

Q. Above farm mortgages?

A. Yes, above the rate that would be received upon farm mortgages.

Cross-examination by Mr. BYERS:

Q. What is the prevailing interest rate for money over the counter for short time loans?

A. In Des Moines on lines of credit on considerable amounts of money and on small amounts of money seven and eight per cent.

Q. There are none being made at eight in Des Moines now?

A. O, yes; lots of them; small loans, from $100 to $300.

Q. For a few days?

A. No, even for a period of time.

Q. What is the lowest rate that you know of at this time, that you know of loans that have been made over the counter in Des Moines, say beginning with the period of the first of last January down to this time, large or small?

A. The lowest rate we made ourselves is six per cent.

Q. Nothing under that?

A. Nothing under six per cent.

Q. You are advised, however, from information that loans have been made here during that time for much less than six per cent.

2032 A. Well, I know that commercial paper——

Q. I mean over the counter.

A. No, I don't know about that, Mr. Byers.

Q. What is the prevailing rate carried by loans that are based on

income buildings in Des Moines, the income buildings located anywhere within the business district?

A. I don't believe I would be—I don't know that I could tell you the lowest rates. I know of some rates. I don't know whether those are the lowest rates or not. Some of the large buildings here, five per cent, and others a little higher than that.

Q. Some lower?

A. Possibly some lower. I know a few years ago they were made lower; I don't know of any since the first of January.

Q. It is true that farm loans are being made now in Des Moines at five and a half?

A. The companies I am connected with are making at six.

Q. The Bankers Life, for instance, is making loans at five and a half?

A. I am not posted as to their rates.

Q. What is the lowest rate that you know of that commercial paper has been carried in Des Moines say from the first of January?

A. Now, that is really a question—we ourselves do not buy any strictly commercial paper. I don't really know what other banks are doing. I know what rates are quoted in the market.

Q. What are they quoted?

A. There has been a rate quoted, mid-summer, as low as three and a half or four per cent.

Q. The money that you understand was willing to carry those loans, was money from the east or local money?

2033 A. Money from the east very largely, this year.

Q. Money seeking investment here and owned by persons who live in the east?

A. Well, commercial paper at that rate, is largely carried by large banks in eastern cities. Des Moines banks do sometimes buy for temporary use.

Q. What is the usual rate of interest on residence loans in the city do you do any of that kind of business?

A. We do not do *of* that class of business.

Q. Do you have any information about it?

A. Yes, I have some information.

Q. What is the rate?

A. I would say, the average residence loans, seven per cent.

Q. Do you know what the bonds of local concerns in local concerns sell for on the market, do you have any information about that?

A. Very little information about that; very few bonds are sold here.

Q. Well, the bonds of a commercial institution, a manufacturing institution, that would sell on the market, at say ninety-five, you would consider above the average, wouldn't you?

A. I would think, Mr. Byers, the most of the commercial enterprises here that float money do it on preferred stock rather than bonds; that commands a little higher rate.

Q. Let us take that, what is the rate usually carried by these preferred stock loans?

A. Preferred stocks usually sell in Des Moines at six per cent.

Q. It is your understanding that that is the method adopted by some of the institutions for raising money, rather than through the bond issue or the sale of bonds?

A. Some of them, yes.

Q. You do not happen to have any stock in the Gas Company?

2034 A. No.

Q. I suppose the Des Moines Gas Company is not your customer?

A. Not our customer.

Q. So that you haven't loaned it any money?

A. No, sir.

Q. You don't know what rate it has paid for loans?

A. I never did business with the Des Moines Gas Company.

Redirect examination by Mr. READ:

Q. Referring to the practice of local institutions raising money upon preferred stock, I suppose the instances you refer to, a limited amount of money is thus raised?

A. A very small amount.

Q. If the proposition was to produce the entire capital, would that affects the question of the rate?

A. Very materially, no doubt.

Q. The line of credit such as improvement bonds, drainage bonds, do you know what the rate is?

A. Seven per cent on those bonds; they bear six and are sold at a discount of one.

Recross-examination by Mr. BYERS:

Q. The rate is limited on this?

A. They bear six per cent when they are sold in this market they are usually sold at a one per cent discount.

Q. Now, with the exemption the law has recently made?

A. Of course, most of those are sold as drainage warrants, some of them drainage certificates; those are sold at seven per

2035 cent; I had an offer this morning.

Q. Drainage bonds now are being floated in the east at par and at six per cent interest?

A. At a much lower rate than here.

Q. These bonds are exempt from taxation?

A. Yes, sir; they are sold in the east at a less rate than here.

Q. Within the last two months, especially since the change in the law, drainage bonds are floated in the east at quite a premium?

A. I think they are sold at something of a premium.

Excused.

Judge CARR: I think we will have to ask the indulgence of the court. We were uncertain as to the length of time the cross exam-

ination would require, and we have a number of witnesses who will be here at half past one this afternoon.

At this time, 11:40 A. M. an adjournment was taken until 1:30 P. M.

2036 1:30 P. M., THURSDAY, *August* 10, 1911.

WILLIAM C. HARBACH, being called on the part of the complainants and sworn and examined in chief by Hon. George H. Carr, testified as follows:

Q. Where do you live?

A. Here in Des Moines.

Q. How long have you resided in Des Moines?

A. All my life, 43 years.

Q. What is your age?

A. 43.

Q. What is your business?

A. Furniture business.

Q. And does that include the manufacturing of furniture?

A. It does.

Q. How long have you been engaged in that business here in Des Moines?

A. I myself have been in it 24 years.

Q. How long has been the business *been* established?

A. 55 years.

Q. By whom was it conducted prior to the time you became connected with the business.

A. My father and my uncle.

Q. What official position do you hold in the company?

A. I am secretary and treasurer of the company.

Q. Aside from your business as manufacturer, have you other business connections, are you connected with any of the banks?

A. Yes, sir.

Q. What banks?

2037 A. I am director of the Valley National Bank in this city and director of the Atlas Insurance Company.

Q. Do you know what the expected net rate of return is sufficient to induce men to invest their money in manufacturing business here in Des Moines? You may answer that yes or no?

A. Yes, sir.

Q. What is the net rate of return expected and usually realized upon money invested in the manufacturing business here in Des Moines?

Objected to an *inconpetemtn*, immaterial and the matter inquired about is irrelevant to any issue involved in this controversy.

A. I should say about 15 per cent.

Q. Has that condition continued for a considerable length of time at least as far back as the 1st of January of this year?

Same objection.

A. I think so.

Q. In your business in connection with banks you are familiar are you not with the rates of interest that are usually received here in Des Moines upon high class securities like first mortgage loans on real estate?

A. Yes, sir.

Q. I wish you would explain to the Master why it is that it requires a materially higher rate of return to interest capital and procure its investment in business enterprises like manufacturing enterprises over what can be obtained in loaning money on first class securities.

Objected to as incompetent, the question is based upon an assumption that is not in the record and it is irrelevant to any question involved in this controversy.

2038 A. Money invested in mortgages or similar securities is looked upon as absolutely safe, incurring practically no risk and cutting out largely the element of hazard. Money invested in a manufacturing business is recognized as engaging in far more hazard than even that invested in a retail or wholesale business and the reason for that being that the manufacturer must ever be prepared to meet the changing condition of the times that invention and custom will bring about making it necessary for him to make almost a complete change of front as the times may demand and containing as it always does an element that is more uncertain than that of any other line of business in that the science of cost is far removed from being an exact science. It is not today known and I think most manufacturers are beginning to recognize that. It is not today known what real cost is it is not known to the extent that all people recognize it as possible to charge the amount of its cost, if a man buys goods to sell again he knows what the cost is. If he manufactures them in a sense he never knows.

Cross-examination by Hon. H. W. Byers:

—. Is your business an incorporated one?

A. It is.

Q. Stock held by local people?

A. Yes, sir.

Q. Altogether?

A. Altogether.

Q. And is there any such thing as preferred stock in it?

A. No, sir.

Q. All straight common stock?

A. Yes, sir.

2039 Q. You have been in business here a good many years?

A. Yes, sir.

Q. I suppose in that time and often maybe it has been necessary to have money to use in the business?

A. Yes, sir.

Q. What rate do you have to pay for money here in Des Moines interest?

A. We have paid all the way from five to eight per cent.

Q. Take it in the last year, from the 1st of January on?

A. Six per cent.

Q. And what is the usual rate here at which loans are carried on business property?

A. That will depend on where the business property is, what section of the town it is in.

Q. Any of this income property here on the west side?

A. Some four and a half, five and five and a half per cent. There are a few loans I know of four and a half per cent, one any way.

Q. Is that the lowest you *not* know of?

A. I don't know of any *any* lower than four and a half.

Q. Take the Fleming property?

A. The Fleming property I think has a four and a half loan on it as I understand it.

Q. Are there any other concerns in the same business that you are in here in Des Moines?

A. Yes, sir; one other.

Q. I suppose if you had all of the furniture business in the territory that you serve, all competition in the furniture business was eliminated and returns from your sales after taking out all taxes and all depreciation, all interest charges and all other overhead charges should leave you net six per cent, you would

2040 be pretty well satisfied wouldn't you?

A. No, I would not stay in the business if I had a guarantee of that.

Q. You would not even if you had a guarantee of that?

A. No.

Q. So the whole question depends on the individual's disposition and desire for return?

A. Not entirely.

Q. Wh*Qt* is it that people are entirely satisfied with even four and a half per cent on loans on property like the Fleming building?

A. Well no individual is, they are loaning out trust funds which they have taken on a basis of three and a half per cent return and that will make one that is clear profit to them. That comes from insurance companies and associations that are loaning money that does not belong to them. They could not get that loan of an individual or bank that had to make a return on it to stockholders, get it from trust funds?

Q. You can get all the loans from banks right now in Des Moines that you want at six per cent can't you?

A. Yes, short time loans.

Q. If I understand you the whole question is one of hazard as you stated.

A. Yes, there is an element of hazard.

Q. That is what makes the difference in what you think ought to be the return, it is hazard that measures the difference in your judgment between the farm loan and the manufacturing business or some other business. Now isn't that hazard altogether one of management?

A. Well I don't quite catch your point there Mr. Byers.

2041 Mr. BYERS: Well that is all then.

Redirect examination by Hon. GEORGE H. CARR:

Q. The money that is loaned in Des Moines at four and a half per cent you say is trust funds, Do you know whether that is local money or money that comes in from the east seeking investment?

A. Yes, sir.

Q. Which is it?

A. It is money from the east.

Q. You refer to the Fleming loan, how long ago was that placed, do you know? Some years ago was it not?

A. Oh it has been placed four or five years I judge. The Northwestern Mutual Life Of Milwaukee has it

Recross-examination by Hon. H. W. BYERS:

Q. You said a moment ago that this money was loaned by trust companyies and insurance companies and not by individuals. Is it not true that in Des Moines since the 1st day of January commercial paper has been carried at as low as three and a half per cent?

A. Well if it has I have not heard of it. I don't know of anybody that would carry it at that.

Q. Well several bankers have already said so?

A. They may have carried it. If the bankers or any bank has carried paper at that rate I doubt very much if it ever came before the board of directors.

Q. I don't mean banks in Des Moines have made loans at three and a half per cent, that is not what I mean, but that com-

2042 mercial paper of institutions in Des Moines has been taken since the first of last January in considerable blocks at as low as three and a half per cent.

Objected to as being simply a statement of counsel to the witness who has stated that he has no knowledge that any such loans has been made it is therefore manifestly improper.

Q. Don't you know of that having been done?

A. No, at that rate.

Q. What is the lowest rate you do know?

A. Well I have been offered money in our own business three and three quarters and four if I would take certain large blocks 25 to 50 thousand on three to four months' time, I must take a certain amount for a specified time.

Q. How long since such offers have been made to you?

A. Oh within the last—well possibly within the last six months.

Redirect examination by Hon. GEORGE H. CARR:

Q. Was that local funds or outside?

A. No, sir; that is eastern money.

Q. I wish you would tell the court in a general way something of the magnitude of your manufacturing business, I have not asked you about that.

A. Our capital stock is $200,000 and our annual volume of business varies from $300,000 to $400,000 a year.

Witness excused.

2043 C. S. WALKER being called on the part of the complainants and sworn and examined in chief by Hon. George H. Carr, testified as follows:

Q. Where do you live?
A. I live in Des Moines.
Q. How long have you lived in Des Moines?
A. Almost 21 years.
Q. What is your age?
A. I am 42.
Q. What is your business?
A. I am engaged in the manufacture of vehicles.
Q. With what particular company are you associated?
A. The Kratzer Carriage Co.
Q. What is your position in that company?
A. I am the president of the company.
Q. Will you please give the court some idea of the magnitude of your business?
A. We are capitalized for $250,000 employing about 100 people and have a volume of business ranging variously from $350,000 to $450,000 per annum.
Q. How long has that company been in operation here in Des Moines?
A. About twenty and one half years.
Q. How long have you been connected with it?
A. Since its beginning.
Q. Do you know what expected net rate of return is sufficient to induce men to invest their money in manufacturing business here in Des Moines. That question you may answer yes or no as to whether you know?
A. Generally speaking, yes I think I could say.
2044 Q. What is the net rate of return expected and usually realized upon money invested in the manufacturing business here in Des Moines?

Objected to as incompetent and not relevant to any issue that is involved in this case, immaterial.

A. The returns on industrials in Des Moines would range from 15 to 20 per cent.

Defendant moves to strike the answer our as incompetent and not responsive.

Q. And how long has that condition existed?
A. I should say that condition had existed for probably ten years, possibly longer.

Cross-examination by Hon. H. W. BYERS:

Q. You mean net returns 15 to 20 per cent?
A. Yes, sir.
Q. Isn't it a little strange to you if that is the case that we don't have a great many more manufacturing institutions in Des Moines?
A. Not particularly so no sir.
Q. Did the Packing house make 15 or 20 per cent net on its business in Des Moines?
A. I could not answer that question.
Q. Your factory has been in operation 20 years?
A. Yes, sir.
Q. What was it capitalized for when it began?
A. In the beginning capitalized at $30,000.
Q. And would that be the assets of the corporation at that time?
2045 A. That was the assets of the company at that time.
Q. What do you say it is now?
A. $250,000.
Q. That is all paid up?
A. Yes, sir.
Q. It has been all accumulated in these years here in Des Moines?
A. Practically, yes.
Q. A very profitable business?
A. We regard it so.
Q. I suppose in that time you have had occasion to carry loans, that is use money?
A. Yes, sir.
Q. What have you been able to get money over the counter from the banks of Des Moines say during the last year and since the 1st of last January?
A. Well over the counter the ruling rate has been five and a half or six per cent I think.
Q. Did your corporation have occasion at any time to bond the concern?
A. Never have.
Q. Or issue anything like preferred stock?
A. No, sir.
Q. All been common stock?
A. Yes, sir.
Q. I suppose it is all owned by local parties?
A. Yes, I think it is all loaned by local parties.
Q. The stock, has not been sold on the market and is not on the market now?
A. No, sir.
Q. And have you had occasion during that time to carry
2046 any loans on real estate or anything of that kind?
A. Never have no sir.
Q. Are you informed as to the prevailing rates for real estate loans in Des Moines?
A. Only in a general way.

Q. And what rate in a general way do you understand is charged on what you would call first class real estate loans in Des Moines?

A. Well I should say from four and a half to five per cent.

Q. Now one thing further, Mr. Walker, do you mean when you say from 15 to 20 per cent, do you mean the net over and above taxes interest and all overhead charges or operating expenses?

A. Yes, sir.

Q. What you mean is net return?

A. Yes, sir.

Q. On what?

A. On the capitalization.

Q. What do you mean, all the money actually used in the business?

A. Well as I would term capitalization I should mean capital and surplus in the business.

Q. Of course you don't use the surplus in the business, that is your surplus I suppose is divided up among the stockholders?

A. No, sir; surplus as I understand surplus is undivided profits and is kept in the business.

Q. Then you mean whatever money goes into the business in the shape of capital whether taken from surplus or whatever it may be?

A. Yes, sir.

Q. As I understand you your institution after 20 years of operation in Des Moines now represents an actual capitalization of

2047 $250,000.

A. Yes, sir.

Q. And that money is used in the operation of the business?

A. Yes, sir.

Q. And your idea is that you ought to have 15 to 20 per cent of that amount over and above every possible charge?

A. Your question now is an individual one I take it to our own business?

Q. Yes.

A. Your previous questions were general?

Q. That is right.

A. In our case I should think we would be entitled to a new return of 15 per cent.

Q. Make it more general, applying it to industries generally of the city and it is your idea that in order to attract capital—that is the way the question was put to you—it is necessary that there be a return of from 15 to 20 per cent on the money actually used in the business, is that your idea?

A. Yes, to attract capital or to sell stock in industrials it would be necessary I think to show an earning of 15 to 20 per cent to make it attractive.

Q. You think that is about the rate that is being earned in Des Moines by manufacturing institutions here generally?

A. I think that it would average that, yes?

Q. Just another question or two. You covered quite an extensive territory I suppose with your business, that it includes not only the city of Des Moines but quite a considerable territory outside of the city?

A. We have covered a good part of six states.

Q. Now if you had a monopoly on the business in the ter-
2048 ritory you serve, that is if you have the business exclusive so that you furnish that entire territory with the goods that they needed in your line and could have that sort of a situation ahead of you for a good many years would you still think that it would be necessary to show an earning of 15 to 20 per cent in order to attract capital?

A. The question is so utterly impossible from our standpoint that it is hardly answerable.

Q. I know it is from your standpoint, but it is not from all kinds of manufacturing institutions and I just wonderec how far you considered now the question of competition and the hazards, of course that must go with competition, the danger of your business being cut into more next year than it was last and all that sort of thing and I wondered how much consideration you gave this.

A. I presume if we could name the prices we would make more than we do if we could — name the prices.

Q. And it would take more to attract capital, you don't mean that?

A. No, I don't think so. Capital would probably be attracted at a much lower rate than that because of the monopoly.

Q. Of course where there is no regulation or control with respect to returns every business man and every owner of a factory then fixes his own return and makes it suit his peculiar notion about it?

A. Yes, so far as he can.

Q. Now you were on a committee that made some investigation in this packing plant down here were you not?

A. If you refer to the Greater Des Moines Committee, yes.

Q. You found that in that case the trouble with that concern was competition largely didn't you?

2049 A. No, I don't think so.

Q. Wasn't it the final decision of the committee that if it could have had the territory surrounding Des Moines that properly belonged to it and had a monopoly on it that it could have operated here and made considerable money at even a much lower rate than 15 or 20 per cent?

A. There is no question as to that, but I think the finding generally speaking was that they had attempted to cover too much territory, they didn't localize enough.

Q. They I suppose could not control prices there in any respect?

A. Prices on that commodity are probably made for them rather than by them.

Q. Now that is not true of your commodity is it?

A. To a certain extent it is. We have very strong competition and we must make prices that goods can be sold at to meet such competition, but we make our own prices.

Q. I suppose it is true as to a great part of your products and the Kratzer buggy or wagon or whatever you make has its own customers and to some extent you have your own territory?

A. Yes, and they have their own value.

Q. When you see 15 to 20 per cent return to attract capital you

mean in a class of business such as this and other business of that nature in Des Moines where all of these hazards are present like competition and chance of loss of crops in the state and the hundred and one other things that might affect the prosperity of the factory or plant?

A. Yes, sir.

Redirect examination by Hon. GEORGE H. CARR:

2050 Q. You have been asked about the advantages of a monopoly in a product which you were manufacturing. Suppose that the consumer instead of the manufacturer fixed the price at which the product was to be sold, would the monopoly be of much value then.

Objected to as incompetent and irrelevant.

Q. If some one else fixed the price the results would be *the* quite questionable.

Q. Especially if it was the man who was the consumer.

A. Yes, sir.

Recross-examination by Hon. H. W. BYERS:

Q. I don't believe you want to be left in that shape. That would depend altogether wouldn't it on what prices are fixed.

A. It certainly would.

Q. Now if the price *was* fixed was a reasonable price for the service and the business had a reasonable guarantee of permanency that would make a wonderful difference wouldn't it in the way of attracting capital?

A. The proposition would have many sides, many phases. *If* course if there could be arrived at a fair price it would be a very attractive proposition.

Q. And that would be altogether a most attractive kind of business for a man to put his money in wouldn't it?

A. It would be very nice I should think.

Redirect examination by Hon. GEORGE H. CARR:

2051 Q. As to whether the price was reasonable or not, would depend of course a good deal on the point of view of the man who considered it reasonable wouldn't it, Mr. Waler?

A. I presume the maker or manufacturer of the article and the man who is buying that article would always have a difference of opinion as to what was reasonable.

Q. Of course your answer was based on the assumption that it was a reasonable price from the standpoint of the manufacturer?

A. Yes, sir.

Q. And did you also take into consideration the assumption that seemed to be involved in the question that there would be a guarantee of that price for some time in the future? That is that the reasonable price that General Byers assumed in his question would continue on for some time in the future, you assumed that also?

A. Well, as I stated there are so many phases to that that the effect of a certain price would have one bearing and if the price was not continued beyond a certain contract period it would have altogether a different effect.

Q. In other words if the price were subject to change at any time by the consumer it would be an element of hazard wouldn't it?

A. I should think so, yes.

Witness excused.

2052 J. E. McDONNELL, being called on the part of the complainant and sworn and examined in chief by Hon. George H. Carr, testified as follows:

Q. Where do you live?

A. Des Moines.

Q. How long have you lived in Des Moines?

A. 44 years.

Q. Is that your age?

A. That is my age.

Q. In what business are you engaged?

A. In iron manufacturing.

Q. And what particular line of manufacturing?

A. Manufacturing boilers, tanks and apparatus of that class.

Q. What is the name of the institution with which you are connected?

A. It is now the McDonnell Boiler & Iron Works.

Q. How long has that business been in existence?

A. The business has been in existence for fifty years.

Q. Here in Des Moines?

A. Yes, sir.

Q. By whom was it conducted before you became connected with it?

A. My father.

Q. It was started by your father was it?

A. Yes, sir.

Q. What is your connection with the business?

A. Secretary and manager.

Q. Is your father still connected with the business?

A. Yes, sir.

Q. In what position?

2053 —. President.

Q. Can you give the court some idea of the magnitude of the business?

A. In volume?

Q. Yes, capitalization and in volume.

A. Our capitalization is now $100,000 and volume of our business will run from $150,000 to $200,000 a year.

Q. Do you know what expected net rate of return is sufficient to induce men to invest their money in the manufacturing business here in Des Moines, answer that by yes or no.

A. Well there don't seem to be any particular amount.

Q. The question is whether you know what expected net rate of return is sufficient to induce capital to invest in the manufacturing business generally speaking?

A. Not less than 15 per cent.

Q. I first ask you if you know, you answer that in the affirmative that you do know?

Mr. BYERS: Of course I want the regular objection in between the question and answer.

Q. The question now is for the purpose of qualifying you and you are to answer that yes or no?

A. Yes, sir.

Q. Now what is the net rate of return expected and usually realized upon money invested in a manufacturing business here in Des Moines.

Objected to as incompetent, irrelevant to any issue involved in this case and no proper foundation laid for the testimony.

A. It is all the way from 15 to 25 per cent.

Q. How long has that condition continued here in Des Moines?

2054 A. Well ever since I can remember, twenty-five or twenty-six years.

Cross-examination by Hon. H. W. BYERS:

Q. Did you notice the form of the judge's question, he asked you if you knew what rate of return was expected by persons—he didn't say by persons—and usually received in Des Moines in manufacturing industries. Now do you wish the court to understand that you know what investors, people who are about to invest money or expect to invest money, what they want or what they expect to receive?

A. Yes, I would like to divide that answer in this way that they expect all the way from 15 to 25 per cent.

Q. They expect all they can get——

A. But they don't often receive it.

Q. They expect all they can get don't they?

A. Well, it is more than an expectancy, it is almost demanded from a man that puts his money in manufacturing in Des Moines.

Q. Well I say they expect to get all they can. Now if I understand there is a party right now as I understand it in negotiation with the so-called Booster's Committee or Greater Des Moines Committee which ever it may be, about establishing a factory of some kind in Des Moines. You don't pretend to know anything about what they figure they are going to receive if they come here do you?

A. No, I do not. I know the nature of their business.

Q. Well let's take it in your own business for just a minute. Have you ever been fortunate enough in any of your business enterprises to have a monopoly upon the kind of business you were doing?

2055 A. Yes, sir.

Q. So that there was no competition of any kind?

A. Yes, sir.

Q. And so that you knew at the end of each year that your business for the next year was going to be larger even than it was in the past year?

A. For a short time only yes.

Q. Now in a business of that kind would that fact make any difference in the amount that you would expect to receive?

A. Well it would help to compensate us for a lot of things we didn't receive that we expected to receive.

Q. Some men put their money in farm mortgages, some put their money in bonds and stocks and other men put their money in factories.

A. Yes, sir.

Q. Some men put it in factories that produce boilers and pipe and that class of goods and other men invest their money in gas property and others in oil. Now would it make any difference at all in your estimate of the rate of return what particular kind of business it was?

A. Yes, a whole lot.

Q. Make all the difference in the world wouldn't it?

A. Yes, sir.

Q. In other words, if your firm now—I don't want you to get the opinion for a minute I am making any objection to either the amount you say you are getting or ought to get nor the kind of business you are in—but take your own firm for instance if you knew, if you could go out of this room convinced that beginning from this date you could increase your business a fixed per cent every
2056 year, would that make a vast difference with you upon the question of the amount that would satisfy you as a return?

A. If I knew I was going to get a fixed price for the produce for a certain number of years and there was no interference with it would simply mean that I would have to make provision as a manufacturer to install a plant that would produce the product and at a price where I could make a profit that was sufficient to pay for it.

Q. Now let me come back to the other question as I said a moment ago some men put their money in mortgages and some in government bonds.

A. Yes, sir.

Q. As I said, much of this is new and interesting to me because the money end of it is rather a new thing to me, if I understand these things the risks that control largely the different persons as to where they put their money is the difference in the hazards and dangers that surround the investment.

A. Yes, sir.

Q. Now then if a manufacturer was producing a particular product if he had a monopoly upon the business, that is if he was permitted to furnish all that was needed in the territory, and no interference in the way of competition and his sales were going to increase every year instead of diminish as the population grew his sales would grow because he has a monopoly, now in a case of that kind aside from the question of management wouldn't his return be just as certain and just as safe as the loan?

A. No.

Q. Why?

A. Because so many conditions surround it.

2057 Q. Aside from the question of management it would be just as safe?

A. There are other conditions that cause a manufacturer to carry a big loss, a big indebtedness outside of management, other conditions in the growth of its business.

Q. I told you that is just as sure as death and taxes that his business is going to grow?

A. It all costs money to operate it.

Q. I mean over and above, you pay operating expenses of course costs money to operate it, costs some money for the man who invests his money even in mortgages, somebody has got to look after the business?

A. Well that is pretty safe.

Q. Let's take it in another way. You have had to have some money in your business?

A. Yes, sir.

Q. And at what rate have you been getting that?

A. From four and a half per cent on right short thirty to ninety days, six per cent to seven per cent.

Q. Of course these loans were for use in the business, that is the money was to be used in the business?

A. Yes, sir.

Q. And of course the person who loaned the money was putting that money into your business just as you put your own and was satisfied with six per cent interest on it?

A. Well he was not putting it in without something to guarantee he was going to get it back.

Q. That was the success of your business was the guarantee wasn't it?

A. Well it was an individual outside of the business too.

2058 Q. I don't know how that could be, is your concern an incorporated concern?

A. Yes, sir.

Q. Well then it has nothing outside of the business?

A. Got the individuals connected with it.

Q. But they would not be liable, isn't it your opinion, the individuals were not borrowing the money. Well let's not discuss that. You say you get money from six to seven per cent?

A. From four and a half to seven.

Q. Was there last January and up to this time, what was the rate over the counter?

A. I think six per cent.

Q. For large or small loan?

A. Well I think that was the current rate that was published by the banks.

Q. About six per cent?

A. About six per cent.

Q. Do you know what the usual real estate loans are in Des Moines?

A. I have borrowed money as low as four and a half per cent on real estate.

Witness excused.

2059 E. S. Root being called on the part of the complainant and sworn and examined in chief by Hon. George H. Carr, testified as follows:

Q. Where do you live?
A. In Des Moines.
Q. How long have you lived in Des Moines?
A. A little over nine years.
Q. What is your business?
A. Manufacturing caskets, ambulances and hearses.
Q. With what institution are you connected?
A. Des Moines Casket Company.
Q. How long has the Des Moines Casket Company been in existence and in business here in Des Moines?
A. About ten years.
Q. Can you give the Master some idea of the magnitude of your business?
A. We are capitalized for $300,000 and $220,000 and something paid in, a little over $220,000 paid in.
Q. About what in the annual volume of business?
A. For our Des Moines plant alone from $200,000 to $250,000 per year, that is for Des Moines.
Q. What is your connection, that is what is your official position in the company?
A. Treasurer.
Q. How long have you been treasurer of the Des Moines Casket Company?
A. Nine years in November.
Q. Do you know what expected net rate of return is sufficient to induce men to invest their money in the manufacturing busi-
2060 ness here in Des Moines, you may answer that by yes or no.
A. Yes, sir.
Q. What is the net return expected and usually realized upon money invested in the manufacturing business here in Des Moines?
A. From 12 to 15 per cent.
Q. Has that condition continued for a considerable period of time, at least as far back as the first of January of this year?
A. Yes, sir.

Cross-examination by Hon. H. W. Byers:

Q. Your business is about the end of the road?
A. About the limit.
Q. That is about the last place any of us have to go to do business. You say it is capitalized for $300,000?
A. Yes, sir.
Q. Was it organized originally in Des Moines?
A. Yes, sir.
Q. By local people?

A. Yes, sir.
Q. And the stock held by local people?
A. I think all of it.
Q. And that has been true ever since its organization?
A. No. We have associate houses in different places and some of the stock is held by individuals at these different places.
Q. The parent concern is here?
A. Yes, sir.
Q. Has been here all the time?
2061 A. Yes, sir.
Q. Later on as the company prospered you opened up what you term branch houses?
A. Yes, sir.
Q. And in these branch houses the local people in these places have taken some stock?
A. Yes, sir.
Q. And business has been prosperous?
A. Fairly.
Q. Do you have the field to yourselves here?
A. As far as manufacturing is concerned, yes.
Q. And have had it all the time?
A. Yes, sir.
Q. You have interested yourself in the business?
A. Yes, sir.
Q. I suppose you have not concerned yourself about buying and selling stock in any other industry?
A. No, sir.
Q. And are not informed as to either the desirability or the value of the stock in other concerns except your own?
A. Only in a general way.
Q. You used some money in your business.
A. Yes, sir.
Q. What were you capitalized at in the start?
A. I think it was $50,000 I am not sure about that. But I think it was $50,000 originally.
Q. The company started pretty close to the ground if I may use the term?
A. Yes, sir.
Q. And has prospered nicely and is now in good shape, it is growing?
2062 A. The company has grown, yes.
Q. In that business the rate of return you say has been what?
A. I have not said.
Q. I thought you did tell Judge Carr.

Judge CARR: I didn't inquire what the rate of return of his business was because I didn't think it was proper.

Q. Did you undertake to say what was the usual and general rate of return to manufacturers in Des Moines?
A. I did not.
Q. Do you undertake to say that to the Master?

A. Yes, sir.

Q. Do you now want to say to the Master that you know what the return generally has been to manufacturers in Des Moines outside of your own business?

A. Yes, sir.

Q. And in what class of business, what line of business?

A. In any class.

Q. In every class?

A. In any class of business. The question he asked me was, what was expected by men who invested for return?

COURT: Do you know what they are actually earning?

A. I do not.

Q. All you done in telling that was what a man expected? I suppose he would be safe to say that men expect all they can get?

A. Usually.

Judge CARR: You know what you are realizing in your own business?

A. Yes, sir.

Witness excused.

2063 E. P. WALTER being recalled on the part of the complainant and examined in chief by Hon. George H. Carr, testified as follows:

Q. When you were on the stand earlier in the case the Master I think it was asked you to prepare a schedule or a table showing the mains laid each year in the distribution system of the complainant company, showing the size of the pains and the number of feet laid each year. Have you prepared such a schedule or table?

A. I have such a table. I did not prepare it myself.

Q. Is Exhibit No. 37 the table to which you refer?

A. Yes, sir.

Q. You have said you did not prepare this table. I wish you would explain to the Master how you obtained it.

A. When I started to prepare this table from the records in the gas company office I found that they had a table which I understand had been made up in Philadelphia at some previous time showing the sizes of the gas mains and the number of feet laid by size in the various years beginning with 1888.

Q. When did you find that table you speak of?

A. After I had been requested to make up such a table.

Q. In going through the records you dug it up, found it?

A. Yes, I found they had this record in the office.

Q. Had you any knowledge of that until the time you made search for it after you had been requested?

A. No, sir; I did not know that a table had been prepared before that.

Q. Now you may go on with the answer.

2064 A. I had a copy of this table made and from the original records in the gas company I checked up this copy and I found it to be substantially correct. There were a few instances

where I did find a very slight difference, they made prac-ically no difference in the result. For instance in the year 1892 in 16 inch pipe according to this record there were 3015 feet of pipe laid, according to the original record I found it was 3041 feet. I found some slight erro-s in there which made no difference and were not always an error because I could not tell in all cases as these figures on the original record had been copied and the copies were blurred to a small extent.

Q. You mean by that you could not make sure whether the original record was correct or whether this copy was correct.

A. Yes, sir.

Q. Because of the inability to read the original record.

A. Yes, the original record was indistinct and I could not tell in all cases what the original figure was, I took what I thought it was, but I may have been wrong.

Q. You have spoken of one instance, were there others?

A. Yes, sir. In the same year 1892 under six inch pipe on this record it shows 3026 feet as being laid. In the original records I find that to be 4986 feet. In the year 1893 on this record under six inch pipe it shows 1915 feet as being laid and I find no report in 1893 of any six inch pipe being laid; but the sum of 1915 and 3026 is practically the same as what I find as being laid in 1892 or 4986.

Q. Did you find any other differences between the two records?

A. In 1896 this record shows 351 feet of 2½ inch pipe being abandoned. I could not find a record of that. It also shows 1950 feet of three inch pipe being aban-oned. I found a record
2065 of 950, but I could not find the 1,000. It also shows 351 feet of six inch as being abandoned, but I did not find that record.

Q. Now any other discrepancy?

A. Yes, in 1902 I find quite a little difference, but as I said before the original records for that year are very indistinct and I could not make these figures out in all cases accurately. The record in this report shows 24,461 feet of four inch pipe. I found on the records 26,247 feet. Six inch pipe this record shows 7,520 and I found 7,232. Eight inch pipe this record shows 6,514 and I found 5,761. Ten inch pipe this record shows 4,733 feet and I found 4,578. The twelve inch pipe is correct and the 16 inch pipe is correct. In the totals for January 1, 1902, on this record it shows 51,062 feet being laid which I find from my figures there is 51,652 feet making this record practically 600 feet less than what I find on the original records, but as I said the copies of these records in some cases are so indistinct that I am not sure I am actually correct here. I think that is all the difference I found. The rest of the years checked out exactly.

Q. In your total figure on this table of miles of main I notice 185.593, that differs from the figure does it not as to the inventory as to the number of miles of main?

A. Yes, it does.

Q. Now will you explain that difference?

A. This is the number of miles of mains in use by the company

January 1, 1911. In the inventory I think that is 183.83 miles and that is the number of miles of main in use November 1st, 1910.

Q. As of the time when the inventory was taken.

2065 A. As of the time when the inventory was taken.

Q. The difference is the additions up to January 1st.

A. This difference is the amount of mains laid in November and December, 1910.

Cross-examination by R. O. BRENNAN, Esq.:

Q. This Exhibit 37 includes all the mains in the distribution system of the Des Moines Gas Co.?

A. Yes, sir.

Q. Does that include Valley Junction?

A. Excluding Valley Junction.

Q. Including the high pressure pipe lin-?

A. Including the high pressure pipe line within the city of Des Moines.

Q. How many feet of high pressure pipe line is there, do you know?

A. No, sir; I don't remember.

Q. That is not indicated on this exhibit?

A. That is not indicated, no sir.

Q. The company has I presume an inventory of the Valley Junction property?

A. Yes, sir.

Q. Showing services and distribution system out there?

A. Yes, sir.

Q. Now if I understand this exhibit you start out with January 1st, 1889 and this indicates that at that time there was in existence 22.86 miles of mains.

A. January 1, 1888.

Q. You start January 1, 1889 with a total and say there

2067 was laid in the year 1888.

A. Yes, sir. The first line also gives the number of feet in use January 1, 1888, the second is the number of feet laid in 1888 and the last is the number of feet in use January 1, 1889.

Q. Then in miles, you reduce the number of feet to miles?

A. Yes, sir.

Q. That is indicated at the bottom of each year?

A. Yes, sir.

Q. So that there was then on the 1st day of January 1888 120,704 feet of main in the distribution system.

A. Yes, sir.

Q. Reduced to miles 22.86.

A. Yes, sir.

Q. During that year was laid 3,685 feet or .69 of a mile?

A. Yes, sir.

Q. Added to the total the preceding year made 23.55 miles in existence at that time.

A. Yes, sir.

Q. You have shown in this table the number of miles, shown

here the number of feet of mains taken up or which were abandoned?

A. Yes, sir.

Q. And have you deducted those from the grand total shown in the report?

A. These are in all cases deducted. Deducted the year in which -ain was abandoned or taken up.

Q. You say that this copy was furnished you or data from this *h this* was made up from the office of the United Gas Improvement Company?

A. I found the copy in the office of the Des Moines Gas Company.

A. I understand the original copy was made up in Philadelphia.

2068 Q. While you found these discrepancies this is substantially correct so far as the records in the gas company's office is concerned?

A. Yes, sir.

Q. Did the company have or was it called *yo* your attention an inventory such as you have produced here or list showing the distribution system in Valley Junction?

A. I don't think that there is a list in this same shape, I am not sure.

Q. But they have something showing the system out there?

A. The number of miles of main in Valley Junction by size.

Q. And when laid?

A. Yes, sir.

Q. Do you remember the size of the high pressure main?

A. Eight inch across the river and six inch from there out to Valley Junction.

COURT: Where does it cross the river?

A. Opposite the gas works.

COURT: Goes under the river?

A. Yes, sir.

Q. I notice in the year 1906 this list shows there was laid during that year 17,618 feet of six inch pipe. Do you know whether that has reference to this high pressure main in West Des Moines?

A. January 1, 1906, 17,618 feet is the number of feet of six inch pipe laid in the year 1905. I am not sure whether that main was laid in the year 1905 or the year 1906. If it was laid in the year 1905 it would be included in that 17,618 feet. I am not sure whether it was laid in 1905 or 1906.

2069 Q. The pipe laid in 1906 appearing in the table January 1, 1907, shows that there was 40,248 feet of six inch pipe laid.

A. Well I would say from that that the chances are that that was laid in 1906 then and not in 1905.

Q. And 8 inch pipe seems to have been laid in that year 6,240.

A. Yes, sir.

Q. You say this high pressure main is 8 inches until it reaches the west side of the Des Moines river?

A. Yes, sir.

Q. Then it was transformed to a six inch pipe?
A. Yes, sir.

Mr. BYERS: We offer in evidence this Exhibit No. 37 as part of the cross-examination.
Judge CARR: Well it may be considered in evidence.

Witness excused.

2070 JANSEN HAINES being recalled on the part of the complainant and examined in chief by Hon. George H. Carr, testified as follows:

Q. You may tell the Master whether as has been intimated from time to time throughout this case the Des Moines Gas company have a monopoly on the business of furnishing light and fuel material or cooking material in the city of Des Moines or whether the business is competitive?
A. They have not a monopoly as you express in the question and the business is competitive.
Q. You may go on and state with what you come in competition both in lighting and in furnishing of fuel for cooking?
A. Well in the lighting field we come in competition first with a thoroughly equipped and up to date electric light plant which furnishes electric light and power for business commercial and industrial uses and has its solicitors in the field all the time trying to secure the same class of business and the same business which we — after.
Q. Let me ask you before you go farther if I may interrupt, do you know whether the rates are fixed by an ordinance of the city, speaking of the electric light rates?
A. I believe they are, yes.
Q. Now you may go on.
A. But competition in rate is not the only competition we have to meet. Competition that we have to meet is the effect of their solicitors in the field trying to secure business which our solicitors are trying to secure. This applies to electric light in the commercial field for lighting stores and also in the domestic field for
2071 lighting houses, for the use of electricity for power in industrial properties, the use of electricity in small cooking utensils and for use of electricity for brazing, heating, principally in an industrial way. And in addition to the electrical competition which we are compelled to meet we have the competition of gasoline and oil, gasoline for heating and for gasoline engines for producing power, have competition which we meet in gasoline used for domestic equipment such as laundry dryers and in industrial equipment in laundries for drying, for laundry irons, and in the field of lighting gasoline is used and delevops in its use a competition which we have to meet. We also have the competition of kerosene, there are a number of companies in the city furnishing both gasoline and kerosene and delivering it in tank wagons at the consumers' houses. Kerosene is used principally for lighting, but in some cases it is

used for cooking and it is used in industrial work for heating furnaces for power. In addition to that we have to meet the competition developed by very cheap fuel, of soft coal which is produced locally and delivered at the houses of the people in Des Moines at a very low rate and it can be used for cooking and in many instances is used for cooking and is also used for producing power and for various heating appliances which the use of gas would be adopted to and with which we are forced in competition.

Q. Is the sale of gas for domestic cooking an important branch of your business?

A. The sale of gas for domestic cooking first commenced to be an important factor about 12 years ago, there were few gas ranges or cooking stoves used before that, but not to any great extent and that has become a very important factor of our business particularly in the later years. I believe that we have records of some
2072 25,000 or 28,000 gas ranges which have been sold in Des Moines to consumers and in addition to that a large number have been sold by the local dealers. In many cases they have been sold in di-ect competition with gasoline and coal.

Q. Can you give an estimate of what portion of your output is used for cooking purposes, that is what proportion or per centage is of the gas sold that is used for that purpose as compared with the percentage that is used for lighting purposes or other purposes?

A. Any estimate that I give would be an approximation because I have no accurate figures on it and purely based on my own judgment. I should say in the neighborhood of about 50 per cent or 60 per cent of the total sales of gas, between 50 and 60 per cent of the total sales of gas are used for domestic fuel consumption in gas ranges or domestic equipment such as laundry driers, and laundry heating stoves, water heaters and things of that nature.

Q. Now this seems to be a very important item of your business, or branch of your business. Now what are the fuels with which you must compete. I think you have stated in part but you may answer more fully and in that connection I wish you would tell the Master so it may go into the record what the fact is as to the supply of domestic coal here in Des Moines, that is how expensive coal beds we have here in a general way, how many mines we have engaged in taking out coal in this vicinity?

Objected to as incompetent, and immaterial.

A. There is a very extensive coal field surrounding Des Moines and under most of the city of Des Moines and coal is produced and sold in Des Moines at a very low figure for domestic use and
2073 for industrial use and we have to meet the competition of that in ranges in the houses of our consumers and we also have other fuels to compete with such as coke and charcoal and anthracite coal. The competition with coke and charcoal is a very material thing in business because these fuels are largely used in restaurant cooking ranges and used by chefs in restaurants and as a rule these chefs or cooks in restaurants are accustomed to the use of these fuels such as Anthracite coal and coke and charcial and it requires a great deal of

effort to get them to change and use gas although it may be more economical and more satisfactory and cause less dirt and so on in their kitchens and their business is difficult to secure because they have been educated to the use of these other forms of fuel and they do not eant to change.

Q. There were some matters that you were asked on cross examination I believe to produce, I don't know whether you have in mind exactly what they are. Have you those documents and records that you were asked to produce?

A. I collected them together immediately and kept them together after that, after I looked over my records, but they have not beecalled for and they are over at the office. I have sent for them. They will be here I think if the man can find them in a few minutes.

Cross-examination by Hon. H. W. BYERS:

Q. You forgot one of your principal competitors didn't you in the light business?

A. If I did I hope you will remind me, I meant to give them all.

Q. You forgot the sun and wood, you forgot that?

Objected to as immaterial.

2074 A. I will answer General Byers' question, the sun is a competitor of ours, we can show it in this way. Our sent out is very materially increased on dark stormy days due that very fact the sun's light is shut off. If we could have all dark stormy days we could have a very large increase in business.

Q. This terrific competition with the electric light people and these other businesses around here, about how much has that reduced your sales in the last four or five years do you think? I will put that in another way. Nobody else here is manufacturing gas for sale either for lighting purposes or heating purposes or any other purposes that you know of?

A. There are a number of people who have private plants for manufacturing gasoline gas and some who manufacture acetylene gas.

Q. Just notice the way I put the question, I think it eliminates these private plants you are talking about. I mean for sale in this community is there anybody manufacturing gas, the kind of gas you are making, either for illuminating purposes or heating purposes.

A. Under a franchise similar to ours you mean in that respect?

Q. I don't care whether under a franchise or without any or how it is.

A. I don't know of any.

Mr. BYERS: That is all with the exception of course I want those things I asked for at some time when you are ready. One thing I wanted was the minutes of the meeting of the Capital City Gas Light Companye's directors and stockholders at the time of the transfer?

Judge CARR: That is the first I ever heard that you were curious about that.

A. I have the oil contracts and the correspondence attached to them.

2075 Q. There was a contract with the Welsbach Lighting Co.?

A. What for?

Q. For gas.

A. That was not called for?

Q. I asked you for contracts and you said the contracts for oil are made by somebody who was purchasing agent for the United Gas Improvement Company*m* that the contracts were held there at the Philadelphia office. I may have asked for all of your oil contracts I don't know, but I have a memorandum of what I asked for which I will have in the morning.

A. If you will look at the record you will note that I stated the purchasing agent for the United Gas Improvement Company and the purchasing agent for the Des Moines Gas Company are the same person and that these contracts are between the oil company and the Des Moines Gas Company signed by the purchasing agent of the Des Moines Gas Company who as an individual is the same man as the purchasing agent of the United Gas Improvement Company. These contracts are the only contracts which are given between the Des Moines Gas Company and the oil company and they are signed by an official of the Des Moines Gas Co. who is purchasing agent and sends me a copy of the contract which he makes.

Q. I won't quarrel with you about that until I have the record?

A. I don't mean to quarrel.

Judge CARR: When General Byers asked about this as I recall it, you said your recollection was that you did not have the original contracts but the material parts of the contracts were furnished you?

A. Yes, sir.

Judge CARR: Do you wish to say anything more about that?

2076 A. I would say that my general understanding that the purchasing agent of the United Gas Improvement Company is the purchasing agent of this company and others and makes contracts with those oil companies direct for the company and because he is able to make a number of contracts of this kind he is enabled to make a very low price as is shown by the correspondence here.

Judge CARR: What I meant particularly to inquire about was, as I recollect your testimony you said that there was sent to you by the purchasing agent as you had it in mind the material parts of the contract. Now what is the fact with reference to that as you find upon investigation?

A. I said I was not sure whether I got a copy of the original contract or just the material parts of it. In looking it up I find I have a carbon copy of the contract itself. These are the ones I offered General Byers just now.

Mr. BYERS: I don't care to spend any time with it now, I am going to use Mr. Haines further later.

Judge CARR: Do you want to recall h*u*m before we rest our case?

Mr. BYERS: But I want my memorandum so that I know what I called for.

Here the further hearing was adjourned until 9:30 a. m. tomorrow.

2076*f* DEFENDANTS' EXHIBIT No. 14.

Filed Apr. 5, 1912. Wm. C. McArthur, Clerk.

Des Moines Gas Company, Des Moines, Iowa.

History of Price of Gas.

Prior to January 1, 1896, the price of gas in Des Moines was:

	Gross.	Discount.	Net.
Illuminating Purposes	$1.80	10¢	$1.70
Fuel purposes:			
Less than 10,000 c. f.....	1.80	30¢	1.50
Over 10,000 c. f.....	1.80	55¢	1.25

City Ordinance No. 724, passed April 29, 1895, and again May 16, 1895, as amended by City Ordinance No. 751, passed February 7, 1896, fixed the *date* as follows:

For all purposes:			
1896 to 1897.....	1.40	10¢	1.30
1898 to 1899.....	1.35	10¢	1.25
1900 to 1901.....	1.30	10¢	1.20
1902, 1903 and 1904.....	1.25	10¢	1.15
1905	1.20	10¢	1.10
1906 to 1910 incl.....	1.10	10¢	1.00

This last rate of $1.00 net is the one in force at the present time.

DEFENDANT'S EXHIBIT No. 15.

Filed Apr. 5, 1912. Wm. C. McArthur, Clerk.

Des Moines Gas Company.

(Here follows Defendant's Exhibit No. 17, marked page 2076*m*.)

2077 Friday Forenoon Session.

AUGUST 11, 1911—at 9:30 a. m.

Counsel for respective parties all present.
Testimony on part of complainant resumed as follows:

JANSEN HAINES, re-called for further cross examination, examined by Mr. Byers, testified:

Q. I have since checked up the memorandum I made at the time when I asked you to produce the minute book covering the transfers of the Capital City Gas Light Company to the Des Moines Gas Company and United Gas Improvement Company, and asked you for your monthly report to the United Gas Improvement Company beginning with September, October, November and December 1910, and I asked for a copy of your last estimate covering improvements and extensions and changes in the plant you say you made, and I asked for the oil contract we were talking about yesterday; now have you with you the minute book that I asked you about?

A. I have here the minute book of the Directors' meeting of February 28, 1906, of the Capital City Gas Light Company, of which Mr. Lewis Lilly, Mr. A. B. Cummins and S. T. Boudine were directors at that time.

Q. For what year?

A. February 28, 1906.

Q. I do not think that is the book I have reference to unless the *the* other minutes I want are in there. The record I want is the minute book showing the transfer.

Mr. GUERNSEY: I think that is the book Mr. Haines refers to, which shows the sale of the Capital City Gas Light Company.

2078 Q. That is what I want. Does that contain the minutes of the meeting of the Des Moines Gas Company when the transfer was made and the property transferred to the United Gas Improvement Company?

Objected to on part of complainant because it assumes the property was transferred to the United Gas Improvement Company.

A. The minutes of this meeting show the sale of the Capital City Gas Light Company as authorized by the board of directors, Mr. Lewis Lilly, A. B. Cummins and S. T. Boudine, under date of February 28, 1906, and the terms of the sale.

Q. What is that?

A. And the terms of the sale.

Q. Is there in the record any minutes of meetings of the Des Moines Gas Company as it was made up at that time, the directory board?

A. No, sir.

Q. Who composed the directory board at the time this transfer was made, of the Des Moines Gas Company?

Mr. GUERNSEY: Turn to the book if you have it.

THIS PAGE
VERTICAL

Mr. BYERS: I have no disposition to get anything I am not entitled to. I want to get the record to show the transfer.

A. Yes, that is all right; I am only too glad to give you any information I can give. I want to understand it before I can give it to you; that is all. The minute book of the Des Moines Gas Company stockholders' and directors' minutes of the meeting held, Des Moines, Iowa, March 1, 1906, shows that the first board of directors were, George H. Carr, James P. Hewitt, Craig T. Wright, F. Corliss Morgan and Rollin Norris.

Q. Does the book you are reading from and the one you referred to a moment ago contain anything else than the record of
2079 the meetings of the directors' and stockholders' meetings"

A. I was going to say, these minute books contain the minutes of the stockholders and directors respectively of the Capital City Gas Light Company and the Des Moines Gas Light Company, as shown in those two books.

Q. There is nothing else in there?

A. No; they are just the minute books.

Judge CARR: You don't mean there is nothing else in the minute books.

Mr. BYERS: I mean whether there are any other matters that ar- not pertinent and relavent to the meetings, in these books, because I am going to have them exhibited.

Judge CARR: The minute books of the meetings of the board of directors, I presume are on a great many subjects.

Mr. BYERS: If Mr. Haines will let me look them over at the office, I will look them over and determine what I want.

Judge CARR: You want the minutes of this transfer of the Capital City Gas Light Company to the Des Moines Gas Company. We are ready to furnish that on the assumption that it is material. I submit to the Master that it is not proper for them to ask us to give them the minute book- to go all through them.

Mr. BYERS: I do not intend to do that. Whatever is proper and material in there I would like to have and would like to get it.

Judge CARR: You are asking us to produce the records, when you ask for a thing you must of necessity show that there is some materiality to it.

Mr. BYERS: How am I going to do that without examining them?

Judge CARR: You do not claim the right to go into all our
2080 records whether they are involved in this case or not?

Mr. BYERS: Of course, the materiality will have to be passed on by the Master.

Judge CARR: The rule is perfectly well settled. If there is anything that is material, we will be glad to furnish it.

Mr. BYERS: I will tell you what I am willing to do. I am willing to let the Master take the book and go through it and let him confine me to the introduction of what in his judgment is material and proper.

Mr. GUERNSEY: I think the rule is absolutely settled in the Federal Court. If a person wants to inspect papers he must set out

what he wants to inspect and that it is material, and set out the facts to show it is material.

Mr. BYERS: Do you want me to do that?

Mr. GUERNSEY: If Mr. Byers has in mind any matters he deems material, if he will let us know what they are, we will either furnish it to him or present the matter to the Master.

The MASTER: This is simply a reorganization of the original Gas Company, a taking it over.

Mr. BYERS: That is exactly one of the things I wanted to get at.

Mr. GUERNSEY: It was an actual sale as a matter of law.

The MASTER: I understand there is an actual deed here and a copy of the articles of incorporation.

Judge CARR: There is an actual deed of transfer from the Capital City Gas Light Company.

Mr. BYERS: I think it makes a good deal of difference whether it is a reorganization or an actual sale. The two books have been produced by Mr. Haines and reference made to matters in them. They may be exhibited at this time and then we will decide later how much of them or what part of them we will want to
2081 use, if any.

Judge CARR: I would like to ask Mr. Haines to state the pages of the minute books of the two records this transfer covers; first state, Mr. Haines, the minutes of the stockholders' and directors' meeting of the Capital City Gas Light Company, that is, the pages where that record is found, and then do the same as to the minutes of the Des Moines Gas Company, if you will.

A. The minutes of the stockholders' meeting authorizing the transfer of the property of the Capital City Gas Light Company are set out in Book 2, Minutes of Stockholders and Directors of the Capital City Gas Light Company, on page 178 to page 182, inclusive; and the Directors' meeting of the Capital City Gas Light Company, following the stockholders' meeting and relating to the transfer of the property of the Capital City Gas Light Company are set out on page 183 to 187 inclusive, in the same book.

Mr. BYERS: The book you were just referring to is the first one you produced?

A. I don't remember which I produred first. It is the Capital City Gas Light Company stockholders' and directors' minutes, Book 2.

Mr. BYERS: What else is there in that book other than the meetings of the directors and stockhoders of the company?

Objected to on part of complainant as being immaterial.

A. I believe that is all, to my knowledge; that is, the minutes of the stockholders and directors at this meeting and other meetings.

Judge CARR: You say that is all. Is that all that is in the book, or all in the book on that subject; I just wanted to understand that answer; is what you referred to all there is in the book
2082 or is it all there is in the book on the subject of the transfer.

A. I think it is all there is in the book on the subject of the transfer.

THIS PAG

The MASTER: He wants to know if the books simply contain the stockholders' meetings and the directors' meetings or whether there is anything else in the books?

A. No, sir; there is nothing else I know of.

Mr. BYERS: The defendants offer the book in evidence.

Judge CARR: We object to the offer of this book in evidence, as a whole, for the reason that it is irrelevant, and immaterial to any matter in issue in this case and is an unnecessary encumbering of the records in this case. Here is a large book containing, I don't know how many pages of matter not shown to be in any wise relevant to the issues in this case. We object to the offer of so much of it as does not pertain to the matter under consideration and object to that part of the book, particularly outside of that which has been referred to and designated by the witness.

The MASTER: I suppose that is merely all you are offering now.

Mr. BYERS: I don't know what is in it. I am going to look at it and see.

The MASTER: The other may be proper as showing the manner in which it is kept.

Judge CARR: Now, your honor will see, General Byers offers this books as a whole in evidence without any claim being made that there is anything in the book aside from the matters specifically inquired about relevant to any issue in this case. He makes the assertion in that connection that he is going to find out what
2083 is in the book. Therefore having offered the book in evidence he will claim the right to go all through the book and go into every matter the book discloses. I submit that is a pretty unusual way of trying a lawsuit.

The MASTER: He can't tear the pages out.

Judge CARR: I suggest that it is quite proper in a case of this kind to seal the document as to any matters not inquired about.

Mr. BYERS: If there is anything you don't want me to have, just seal it. I want everything in there that pertains to this property.

Judge CARR: We simply want to try our case in an orderly kind of a way; we do not want the implication cast that we have something in the book we do not want General Byers to see. If there is anything that can have any possible bearing on this lawsuit, it is there for him.

Mr. BYERS: How can I find out?

Judge CARR: If you have anything in mind that you want you can suggest it. The witness told you that is all there is in the book.

The MASTER: They have a right to examine the books to see whether there is anything they want. The other matter can be determined later.

Mr. BYERS: What is the name of that other book?

The WITNESS: This is the Des Moines Gas Company No. 1 stockholders' and directors' minutes.

Mr. BYERS: The defendant- offers that in evidence in connection

with this cross examination in so far as the matters in the
2084 book refer to the business of the Des Moines Gas Company and its property.

Judge CARR: To that complainant objects as being immaterial and irrelevant to any matter in issue in this case, other than that part of the book which has been referred to and identified and designated by the witness as being the record with reference to the transfer of the Capital City Gas Light Company to the Des Moines Gas Company.

The MASTER: That is all I understand they want.

Judge CARR: Did you point out in your answer, Mr. Haines, the pages of that book?

A. I wasn't asked to.

Judge CARR: In connection with this objection I would like to ask the witness to point out to your honor the pages of that book which contain the record of the transfer between the two companies and designate and specify the pages which contain that record.

A. Pages 1 to 53 inclusive.

Judge CARR: Let me ask you, Mr. Haines, if that book which you have produced designated Des Moines Gas Company Stockholders' and Directors' Meeting, contains other records of the stockholders and directors of the Des Moines Gas Company that relate to wholly different matters from that concerning which you have been interrogated?

Objected to on part of defendants as not re-examination or proper.

A. It does, yes sir.

Judge CARR: We renew our objections. We have been asked to produce certain records here and have produced them, but
2085 they are bound in volumes with these others, and I think that the production ought to be confined to the things we have been asked to produce and that are relevant to the issues in this case. As I understand General Byers, if these books are to be received in evidence, the parts of the books not offered ought to be sealed in some way and it ought to be understood that they are no part of the record offered in this case, and we ought to know that with reference to making up the record finally.

Mr. BYERS: Let me finish my cross examination and see whether I know myself what I want. There will be a good deal less trouble maybe after we get through.

Q. What book have you before you now?

A. This is the Des Moines Gas Company No. 1 Stockholders' and Directors Minutes.

Q. Now you stated that certain pages contain the minutes of the directors meetings of the Des Moines Gas Company for certain purposes; what is contained in the balance of the book, in a general way, not particular things in it, but what is the book made up of the balance of it, what does it show?

Objected to as being immaterial.

A. Is simply shows the minutes of the meetings of the stockholders and directors as they occur regularly, annually and monthly, the annual meetings of the stockholders and monthly meetings of the directors and occasionally a special meeting.

Q. And has reference only to the conduct of the business of the Des Moines Gas Company?

A. So far as I know I would say yes.

Q. Now the other book, what is the name of that?

2086 A. The Capital City Gas Light Company No. 2 Stockholders' and Directors' Minutes.

Q. You referred to certain pages on that one?

A. Yes, sir.

Q. Upon which is written a record of the meetings, minutes of the meetings, of the directors' and stockholders' meetings covering the transfer of the Des Moines Gas Light Company's property to the Des Moines Gas Company?

A. Yes, sir.

Q. What do the other pages of that book contain?

A. Just the minutes of the regular meetings of the stockholders and directors of the company in relation to the conduct of the business, and there may be some special meetings in it.

Q. I said Des Moines Gas Light, I meant the Capital City Gas Company.

A. This book that you last referred to is the book of the Capital City Gas Light Company.

Q. As I understand your last answer, the pages to which you have so far not referred to as showing what was done in the way of the transfer of the property, simply have the minutes of the meetings of the directors and stockholders of the Capital City Gas Light Company in connection with the conduct of its business here in Des Moines in the manufacture and sale of gas, is that right?

A. Yes, that is correct so far as I know.

Q. Now, with that explanation, I am going to leave the books for a minute—have you got these reports I inquired about?

A. I have 26 of them, as the 26 monthly reports, but I did not understand your question as asking for them for a series of months.

Q. I asked for September, October, November and December of 1910.

A. Well I simply have the form on which the report is

2087 made; if you want the report we can produce the report. I thought you wanted the form of the report.

Q. I wanted those, 1, 2, 3, 4, the last reports for 1910.

A. Of course, your honor, that means there are some 75 of these reports to make up and copy.

Q. Oh, no; four months I want.

A. Well, there is 26 for each month.

Judge CARR: You are calling for the reports sent to Philadelphia.

Mr. BYERS: Yes, I understood Mr. Haines to say there was daily reports and monthly reports.

A. There are no daily reports at all.

Q. If you will turn to pages 156 and 157 of the transcript you will

see that I asked for the monthly reports for November—beginning September, October, November and December 1910.

A. I have here just what I said, 26 forms on which these reports are made.

Q. You mean each report is made up of 26 separate reports?

A. Yes, sir; there is no monthly report in the sense of collective monthly reports, but these reports are made up as the information comes to the office from the various departments and is taken off the books and sent in to the office of the United Gas Improvement Company in Philadelphia.

Q. Now, if it will lighten the burden any, if you will get me only one, say for September 1910, as you send that in.

A. I haven't got that report. We would have to make a copy from our books of that report. We can do it, but of course it would probably be four or five days' work of an expert book keeper to do it. Your own bookkeepers can make it up the same way.

Q. The original is in existence?

2088 A. Yes, I presume it is in the files in Philadelphia.

Q. Right at that point, will you furnish the Master a transcript of the books and record of the United Gas Improvement Company in so far as it applies to the Des Moines Gas Company here?

A. I'd be glad if I had them; but I haven't got them.

Q. You say that this material is at the Philadelphia office?

A. I say your own bookkeepers can make it up just exactly the — as ours can, right here from our records. It is purely a matter of arithmetic, the bookkeeping forms are all here and all you have to do is to take it off the books.

Q. I don't question your word about it, but I don't know how they can do it without some direction and instruction from you.

A. The forms are almost self-explanatory; any expert bookkeeper can understand them.

The MASTER: You don't retain a copy?

A. We do of some and not of others.

The MASTER: You haven't a copy of it?

A. I didn't bring any copies over because I understood the request called for the form on which they are made out.

The MASTER: Have you got any copy?

A. I have some of them.

Q. Didn't you tell me the other day in your examination you had copies of these reports in your office?

A. Not all of them.

Q. But the ones I asked you about?

A. You asked me for all of them.

Q. Now I ask you for September, October, November and December, 1910.

A. As I stated, we have some of them.

Q. If you have the 26 of any one of those months, I would like to have you produce them.

2089 A. You understand these reports are taken right from our books and the report itself is made out on a special form for convenience in checking and for convenience in finding the

various functions the different departments are interested in. These reports are made up with that idea in view and sent down to the Philadelphia office.

Q. Do you keep an account with the U. G. I.?

A. What kind of an account?

Q. Any kind?

A. Yes, certainly.

Q. Do you keep a separate set of books covering your accounts with the U. G. I.

A. What do you mean by separate set of books?

Q. Just what the question states.

A. Do you mean a duplicate set of books?

Q. I mean a separate set of books from the books you keep showing the business of the Des Moines Gas Company?

A. Certainly not; what would be the object in it.

Q. I don't know.

The MASTER: He simply want- to know whether that is the case or not.

A. No.

Q. Do the books of the Des Moines Gas Company kept up here in the office show the transactions between the U. G. I. and the Des Moines Gas Company?

A. Absolutely.

Q. All of them?

A. They couldn't show anything else.

Q. Then you make reports, complete monthly reports to the U. G. I. of the business?

2090 A. Yes.

Q. That is what I want; I don't care anything about those 26 separate ones.

A. But that complete monthly report is made up in this form.

Q. I don't care what form; that is what I want, one of those complete reports.

A. Those various transactions are reported on different sheets, the sales, manufacturing results, outstanding accounts, disbursement sheets, journal entries, are all made on these sheets as they go on the books during the month. Those reports are made out and sent to Philadelphia for their own examination and to keep them advised of the operations of the local company. But there is no general monthly report in the sense of a large collective report made.

Q. Do you make an annual report?

A. No, sir; not any more than this.

Q. You will furnish us at your convenience a complete month, I don't care which one of those four it is, as you have it here in the copy?

A. All right.

Q. Now, the estimate you say you made out for last year?

A. Yes, sir.

Q. You say you have it here?

A. I have here the annual estimate of the expenditures required for the year 1911, showing the actual increase in sales up to the

period which this estimate is made, and my estimated increase of the capacity of the plant and the various component parts of the plant, and an estimate of the requirements necessary for the year 1911, in order to keep the plant up and in condition, and to provide extensions and improvements necessary with an estimate of
2091 the cost of the labor and material needed to complete these extensions and improvements. It also contains my letter under date of April 8th to Mr. Rollin Norris who is the superintendent of works of the United Gas Improvement Company and a director of the Des Moines Gas Company, and my recommendations contained in this letter in regard to certain items of improvements required for the plant of the Des Moines Gas Company. This annual estimate is made up of a large correspondence we would be glad to have you, if you wish to do so, examine, or offer in evidence the whole correspondence, and it is so built up together it is difficult to withhold any portion of the correspondence and make the balance of it perfectly clear.

The MASTER: It is a sort of talking the matter over?

A. Yes, sir; correspondence on each item of improvement to determine what is to be done definitely. In addition to that is my annual estimate contained in the letter to Mr. Rollin Norris under date of September 1st.

(Said annual estimate is marked by the reporter as Defendant's Exhibit 18.)

Q. Now, just one thing further——

A. That is not a complete estimate; if you want to know——

Q. That is what you produce as an estimate?

A. I have some more here, which is a copy of my letter making recommendations to the engineering department of the United Gas Improvement Company.

Q. Is it all in the package?

A. Yes.

Q. You can tack it all together in one exhibit?

A. Yes.

2092 Mr. BYERS: The reporter will attach that to Exhibit 18.

The WITNESS: I mentioned Mr. Rollin Norris as a director of this company. I want to correct that mistake. Mr. Rollin Norris is not a director of the company, but it is sent to him for Walton Clark, Second Vice President, who is a director and officer of this company.

Q. There is just one thing further I want to inquire about; do you have at this time any contract between the Des Moines Gas Company and the United Gas Improvement Company with respect to the business here in Des Moines?

A. What nature of contract?

Q. Any nature?

A. That is rather br*a*od, General.

Q. Well, have you any contracts of any kind with respect to the business here in Des Moines?

A. If you could suggest some line of thought on the matter it

would make it more simple for me; I don't understand what you mean to get at.

Q. Do you think of any contracts you have with them?

A. I don't happen to think of any at the present time.

Re-direct examination by Judge CARR:

Q. Mr. Haines, can you state about what has been the percentage of increase in the sale of gas in Des Moines, during, say the last six or seven months, as compared with the corresponding period of last year?

A. I have prepared a statement of the gas sent out and accounted for for the seven months ended July 31, 1911, for the purpose of comparing with the corresponding period of 1910. This
2093 statement shows that the increase for those seven month- was 6.14 per cent.

Recross examination by Mr. BYERS:

Q. At what rate do you furnish the Wellsbach people gas?

Objected to on part of complainant as being immaterial.

A. For what purpose?

Q. Any purpose.

A. At a dollar per thousand cubic feet.

Q. Do you furnish them any less rate than that?

A. Not that I ever knew of.

Q. You have a contract that covers the business?

A. I believe we have, yes sir.

Q. Street lighting and park lighting?

A. Not park lighting, no. We have nothing to do with the park lighting. The park lights are all gasoline lights; we only furnish them gas.

Q. What is the lowest rate that you sell gas for here in Des Moines?

A. One dollar per thousand cubic feet.

Q. None of your customers get it for less?

A. No, sir.

Q. So that you get a dollar for every cubic foot of gas, every thousand cubic feet of gas you sell in Des Moines?

A. Yes, sir; if we are able to collect the money.

The MASTER: No rebating?

A. Absolutely none whatever.

Q. So there is no loss on that end; you get a dollar for every thousand cubic feet of gas to the consumers?

A. We get a dollar, if we are able to collect the bill; that
2094 is what I understand you to mean.

Q. Now the balance sheet for 1886, do you have that with you?

A. I think it was Mr. Hagenah you asked for that. You did ask me for some figures in regard to the number of miles of mains in 1903 on January 1st.

Q. We have got that information since.
A. That was 88 miles. Also as to the number of meters.
Q. We have got that.
Mr. BYERS: There were a few things Mr. Lea was to do.
Mr. GUERNSEY: He is not here this morning, but he will be back next week.
Judge CARR: You called for the contracts for oil.
Mr. BYERS: Yes, I want those copies.
A. I think you called for the coke contract as well as oil contracts; I have them all here. And this is a copy of the correspondence leading up to and the final contract for oil used for gas making purposes, the contract being dated the 6th of May 1907.

(The contract produced is marked Exhibit 19.)

Answer continued. And the correspondence leading up to and the copy of the contract entered into the purchase of oil, the contract being dated the 14th day of May, 1909.

(Which correspondence and contract is marked Exhibit 20.)

Answer continued. The next is a like contract and correspondence for the purchase of coke, the contract being dated May 27, 1911.

(Which is marked Exhibit 21.)

Q. Now, Mr. Haines, this contract, as I understood you the other day, they were all made by the purchasing agent of the U. G. I. United Gas Improvement Company of Philadelphia, is that right?
A. No, sir; I think that is absolutely wrong. They are made by the purchasing agent of the Des Moines Gas Company who
2095 happens to be the same man as purchasing agent of the United Gas Improvement Company.
Q. They were all made by the man who is purchasing agent for the Des Moines Gas Company and the United Gas Improvement Company of Philadelphia?
A. They are all made by the same man, yes sir.
Q. And the rate stated in the contract is the rate that the company furnished the oil for?
A. Absolutely, yes sir.
Q. You swear to that?
A. Absolutely, yes sir.

The defendants offer in evidence Exhibits 19, 20 and 21 which are as follows:

"DEFENDANT'S EXHIBIT 19.

"PHILADELPHIA, *May* 31, 1907.

"Mr. Jansen Haines, Manager, Des Moines, Ia.

DEAR SIR: Replying to your letter of 20th on the subject of routing of oil by Standard Oil Co., would say that Mr. Higgins writes me as follows:

'We would not care to be committed to make all of the oil deliveries over the C., B. & Q. R. R. It is the intention to divide the business as nearly as practicable between the roads entering Des Moines.'

"This is not a very satisfactory reply, but I wish you would advise me a little later what the C., B. & Q. are getting out of the business and I will try to induce Mr. Higgins to increase the tonnage to them.

"The Standard Co. has a way of denying your request and then doing what you want and it may be this will be the outcome of this present case. Of course we are not able to dictate the routing with this company, as you know from our experience with them in the past.

Yours truly,

J. A. PEARSON,
Purchasing Agent.

(Noted June 3, 1906.)
(J. H.)

2096 *"Reply to Letter of 20th, Referring to Oil Contract.*

PHILADELPHIA, *May* 22, 1907.

Mr. Jansen Haines, Manager, Des Moines, Ia.

DEAR SIR: Replying to yours of above date and subject, would say I had intended to write you about this matter but had so many of these contracts to close that the point was overlooked.

The C. & G. W. was put in the contract by the Standard Co. as they believed that this was the routing we preferred. The question was not taken up at the time the contract was made because, as a rule, the Standard Co. obliges us in these matters.

I am today writing Mr. Higgins asking him, if his transportation people do not object, to give all your oil business to the C., B. & Q. road. It is barely possible he will want some of this business to go to the Rock Island, but I will do my best to have it all routed by the Q. road in order to cooperate with the arrangements you have made with them.

Yours truly,

J. A. PEARSON,

"(Received May 24, 1907.)
(Noted May 27, 1907.)
(J. H.)"

"May 17, 1907.
Standard Oil Company Contract.

MAY 20, 1907.

Mr. J. A. Pearson, P. A., Philadelphia, Pa.

DEAR SIR: I beg to acknowledge receipt of your letter as above, enclosing oil contract. I note that this contract states that the oil will be delivered in tank cars at Des Moines, Iowa, on the Chicago

Great Western Railroad. I presume that this is intended to give the routing via the Chicago Great Western, but as a matter of fact, we are not on the Chicago Great Western tracks.

I was in hopes that you might swing this routing to the C., B. & Q. in order to hasten the completion of our arrangements with them, but no doubt you had this in mind and adopted the most

Very truly yours,

——— ———, *Manager.*"

J. H./E. D.

"PHILADELPHIA, *May* 17, 1907.

"Mr. Jansen Haines, Manager, Des Moines, Ia.

DEAR SIR: Enclosed is copy of contract with Standard Oil Co. for your supply of gas oil for one year from June 1.

Yours truly,

J. A. PEARSON,
Purchasing Agent."

"Agreement made this 6th day of May, A. D. 1907, between the Standard Oil Company of New York, a corporation organized under the laws of the state of New York, party of the first part, and Des Moines Gas Company, Des Moines, Iowa, party of the second part, witnesseth:

In consideration of the mutuality hereof it is hereby agreed between the parties hereto as follows:

1. The party of the first part sells and agrees to deliver to the party of the second part the number of gallons of gas oil, 28 to 34 gravity, the second party shall use in the manufacture of gas in its plant during the contract period beginning June 1st, 1907, and ending May 31st, 1908, such supply to be One Million Eight Hundred Fifty Thousand (1,850,000) gallons, 10% more or less.

2. The party of the second part agrees to receive the gas oil defined in section 1 at and for the price of Four and Fifty-five Hundredths (4.55) cents per gallon delivered in tank cars at Des Moines, Iowa, on the C. & G. W. R. R.; such deliveries to be made as the business of the second party may require and as they in writing order, but not less than one tank car at any one time.

This Agreement is understood to cover the liquid gas making material that will be required for use in the plant of the said party of the second part during the period embraced in this agreement, but total deliveries for the year shall not exceed the quantity above specified.

The party of the first part agrees that there will be no unusual or unnecessary detention in the shipment of the oil herein
2098 mentioned, but said party shall not be held responsible for accidents or unavoidable delays in the delivery of same.

It is agreed between the parties hereto that prompt unloading of the cars shall be within forty-eight (48) hours (Sundays and legal holidays excluded) after its delivery hereunder to the party of the second part.

It is agreed between the parties hereto that the payments shall be made in cash, monthly, on invoices of the preceding month, interest at six (6) per cent thereafter, funds current in New York.

In witness whereof, the parties hereto have executed this agreement the day and date first written herein.

STANDARD OIL COMPANY OF NEW YORK,
By —— ——, *Manager Naphtha Department.*
DES MOINES GAS COMPANY,
By —— ——, *Purchasing Agent.*"

DEFENDANT'S EXHIBIT 20.

"Agreement made this 14th day of May, A. D. 1909, between the Standard Oil Company of New York, a corporation organized under the laws of the state of New York, party of the first part, and Des Moines Gas Company, Des Moines, Iowa, party of the second part, witnesseth:

In consideration of the mutuality hereof, it is hereby agreed between the parties hereto as follows:

1. The party of the first part sells and agrees to deliver to the party of the second part its successors or assigns, the number of gallons of gas oil, 28 to 34 gravity the second party shall use in the manufacture of gas in its plant during the contract period beginning June 1, 1909, and ending when full quantity is taken such supply to be Seven Million Five Hundred Ninety Thousand (7,590,000) gallons. This quantity is expected to cover three years' supply.

2. The party of the second part agrees to receive the gas oil defined in section one at and for the price of Two and Eight-
2099 tenths (2.80) cents per gallon delivered in tank cars at Des Moines, Iowa, on the C. & G. W. R. R.; such deliveries to be made as the business of the second party may require and as they in writing order, but not less than one tank car at any one time.

This agreement is understood to cover the liquid gas making material that will be required for use in the plant of the said party of the second part continuously until the full quantity is taken but total deliveries shall not exceed the quantity above specified.

The party of the first part agrees that there will be no unusual or unnecessary detention in the shipment of the oil herein mentioned, but said party shall not be held responsible for accidents or unavoidable delays in the delivery of same.

It is agreed between the parties hereto that prompt unloading of the cars shall be within forty-eight (48) hours (Sundays and legal holidays excluded) after its delivery hereunder to the party of the second part.

It is agreed between the parties hereto that payments shall be made in cash, thirty days after date of invoice, interest at six (6) per cent thereafter, funds current in New York.

In witness whereof, the parties hereto have executed this agreement the dat and date first written herein.

STANDARD OIL COMPANY OF NEW YORK,
By —— ——, *Manager Naphtha Department.*
DES MOINES GAS COMPANY,
By —— ——."

NOTE.—With due notice to the buyer it is optional with the seller to deliver crude oil of suitable quality in lieu of gas oil during any portion of the contract period.

"PHILADELPHIA, *May* 13, 1908.

"Mr. Jansen Haines, Manager, Des Moines, Ia.

DEAR SIR: I enclose, for your information, copy of oil contract closed with Sun Co. for your supply of Illinois crude oil from June 1, 1908.

2100 The Sun Co. ask me to advise you to send shipping direction to C. W. Pittinger, Agent, Sun Co. Robinson, Ill.

Yours truly,

J. A. PEARSON,
Purchasing Agent."

"Received May 15, 1908.
Noted May 15, 1908.
J. H."

"Agreement made this 6th day of May, A. D. 1908, between the Sun Company, a corporation existing under the laws of the state of New Jersey, party of the first part, and Des Moines Gas Company, of Des Moines, Iowa, party of the second part, witnesseth:

In consideration of the mutuality hereof it is hereby agreed between the parties hereto as follows:

1. The party of the first part sells and agrees to deliver to the party of the second part, or its assigns, and the party of the second part agrees to purchase and receive from the party of the first part, Two Million, One Hundred and Thirty Thousand (2,130,000) gallons, 10% more or less, of crude oil from the Illinois field, to be required for manufacture into gas at the gas works of the party of the second part, during the contract period beginning June 1, 1908, and ending May 31, 1909, at the price of Three and Ten Hundredth- (#.10) cents per gallon, f. o. b. cars at the gas works Des Moines, Iowa.

2. The party of the second part agrees to pay for all the crude oil as defined in section 1, monthly on the invoices of the preceding month, deliveries to be made as hereinafter set forth.

3. The party of the first part agrees that during the period of this agreement, deliveries shall be made as the superintendent of the party of the second part may in writing order, but in no case shall less than one tank car be ordered at any one time.

In witness whereof the said parties have executed this agreement the day and date first written herein.

SUN COMPANY,
—— ——, *President.*
DES MOINES GAS COMPANY,
By —— ——, *Purchasing Agent.*"

2101 "May 1, 1908.
Oil Contract—1908.
See File #19—5-5-1908.

MAY 5, 1908.

Mr. J. A. Pearson, P. A., Philadelphia, Pa.

DEAR SIR: I beg to acknowledge receipt of your letter as above and note that the new oil contract from June 1st, is with the Sun Oil Company, for Illinois Crude Oil at 3.1¢ per gallon, delivered here. I am very much pleased to note this price. It is the first ray of sunshine I have seen in a long time.

Very truly yours,

—— ——, *Manager.*"

J. H./E. D.

"PHILADELPHIA, *May* 1, 1908.

Mr. Jansen Haines, Manager, Des Moines, Ia.

DEAR SIR: I have your letter of April 28th on the subject of oil, and in reply would say you will probably be pleased to know that I have made your new contract from June 1, with Sun Oil Co. for Illinois crude oil, at 3.1¢ per gallon, delivered f. o. b. Des Moines.

Mr. Norris considers that this Illinois Crude is better for gas making than gas oil such as we have received in the past.

I will send you copy of formal contract as soon as it is executed.

Yours truly,

J. A. PEARSON,
Purchasing Agent."

"Received May 4, 1908."

2102 "April 20, 1908.
Oil.

APRIL 28, -8.

Mr. J. A. Pearson, P. A., Philadelphia, Pa.

DEAR SIR: I had a visit today from Mr. P. D. Schall, General Manager, Kansas City Oil Company, Kansas City, Mo.

Mr. Schall tell- me that he is refining a superior grade of oil, but that the output of his company, at the present time, is only about 20 cars a month and that they have about 50 tank cars. He tells me that they are increasing their business and will probably be able to make us a bid on our oil contract next year. I suggested his getting into communication with Burlington and Sioux City as these towns are more nearly his size than Des Moines. He, at present, is selling to the Boone Gas Company, at 4½¢ f. o. b. Boone, but tells

me that he could make us a better price if he could supply the demand.

Very truly yours,

——— ———, *Manager.*

J. H./E. D.

"*Reply to Letter of 15th, Referring to Oil.*

PHILADELPHIA, *April* 20, 1908.

Mr. Jansen Haines, Manager, Des Moines, Ia.

DEAR SIR: I have yours of above date and subject and in reply would say that I anticipate we will get a considerable better price for next year than the one we are at present paying.

I do not know just what you mean by the "opportunities which apparently present themselves for lower prices,' but perhaps you have some locally, and if so, I would be glad to get the benefit of them.

Mr. Kellogg recently wrote me about the Webster Refining Co. offering him a pretty low price for next year's business. It is possible something of this sort has come before you.

I have always felt we must give our oil business to a concern who could take care of it, although I am perfectly willing to use these small fellows to get a low price for you. So far the only oil
2103 companies who have been able to make us satisfactory arrangements were the Standard and Sun Companies. There are one or two other concerns, such as the National Refining Co. at Cleveland and the Indian Refining Co. in Kentucky, but the first named company has always named too high a figure and the Indian Co., I understand, do not keep their contracts.

I think you can safely count on getting good deal better prices,—perhaps a cent a gallon,—than last year, for the coming contract period, and, as I said before, if you have any suggestion or local prices, I should be more than glad to hear from you.

Yours truly,

J. A. PEARSON,
Purchasing Agent."

"Received April 22, 1908."

"Oil.

APRIL 15, '8.

"Mr. J. A. Pearson, *P.* A., Philadelphia, Pa.

DEAR SIR: Kindly advise me what you anticipate in the way of oil prices for next year's contract. It seems to me that Des Moines has been paying abnormally high prices for its oil, compared with some of the opportunities which apparently present themselves for lower prices.

Do not think that I do not appreciate your desire to give us the best you can. At the same time I also appreciate that you are handicapped in some ways in your position of purchasing such large quantities from such a limited selection of producers.

Please give me your views on this subject at your earliest convenience, and oblige,

Yours very truly,

—— ——, *Manager.*"

J. H./E. D.

Contract for Milwaukee Solvay Run-of-Oven Coke.

MILWAUKEE, WIS., *May 27th*, 1911.

1. Party of First Part.	The Milwaukee Coke and Gas Company, Milwaukee, Wis. By Pickands, Brown & Company, Agents, Chicago, Ill. Agreeing to sell.
2. Party of Second Part.	Des Moines Gas Company, Des Moines, Iowa. Agreeing to buy.
3. Quantity.	Ninety-five hundred (95) tons, 10% more or less for delivery in about equal monthly quantities during the contract period.
4. Quality.	Milwaukee Solvey Run-of-Oven Coke.
5. Delivery.	F. O. B. cars Milwaukee.
6. Duration of Contract.	From June 1st, 1911, to June 1st, 1912.
7. Weights.	Western Railway Weighing Association weights at ovens to govern settlements; 2,000 pounds to constitute one ton of coke.
8. Price.	Four and no/100 Dollars ($4.00) per ton.
9. Terms.	Cash on the 15th of the month for all coke shipped the month preceding (freight cash). Payable in New York or Chicago Exchange.
10. Conditions.	Party of the first part not to be held in damages for failure to furnish coke, as aforesaid, on account of car shortages, railroad delays, strikes, trouble with workmen, accidents, or other causes beyond its control. Each month's shipments to be treated and considered as a separate and independent contract.

Made and entered into the date first above written as witness our hands.

Signed in duplicate.

Copy.

THE MILWAUKEE COKE & GAS COMPANY,
By PICKANDS, BROWN & COMPANY, *Agents,*
By H. J. SCHLESINGER,
Sales Manager, Milwaukee Office.
DES MOINES GAS COMPANY,
J. A. PEARSON, *Pur. Agent.*"

2106 Cross-examination of the witness HAINES continued:

Q. Is this man who did the purchasing of the coke and oil, J. A. Pearson, the purchasing agent?

A. Yes, sir.

Q. I have here in connection with this Exhibit 21 a sheet on which the following appears: "Confirmation of Telegram, Purchasing Department United Gas Improvement Company. Philadelphia, June 10, 1911. Pickands, Brown & Co., Colby Abbot Building, Milwaukee, Wisconsin. Our Des Moines Manager advises he has had no shipments of coke since twenty-ninth ultimo. Start shipments to him at once. J. A. Pearson, Purchasing Agent. Des Moines a/c 10.15 Received June 14, 1911." That was in connection with a shipment of coke, wasn't it, to this plant here?

A. Yes, sir; I wrote to Mr. Pearson and told him we were not re- the shipment of coke.

Q. You telegraphed him, here is what you did: "June 9, 1911. J. A. Pearson, Broad & Arch Streets, Philadelphia, Pa. Please wire parties with whom you placed coke contract to commence shipments immediately. We have not received notice of shipment since 29th ultimo." That is the man you refer to as the Purchasing Agent of both concerns?

A. Yes, sir.

Judge CARR: With the reservation spoken of yesterday, I think this is our evidence, so far as our evidence in chief is concerned.

Mr. BYERS: There were some matters Mr. Lea promised to furnish me.

Mr. GUERNSEY: I told him last night to go home and straighten things out in his office. I suppose it had been forgotten, but he will be back in a few days.

2107 Mr. BRENNAN: We want the balance sheet which he says was furnished him by the company, or the one from which he made his analysis.

Witness excused.

WILLIAM J. HAGENAH, re-called for further cross examination, examined by Mr. Brennan, testified:

Q. Do you have in mind the request made yesterday with respect to certain balance sheets and other records?

A. Yes, sir. You requested a number of items and I tried to get all you asked for, as far as I possibly could in the time at my disposal. You asked for the balance sheets from 1900 to 1910. The balance sheet for 1910, December 31, of that year, is in my report Exhibit 23, and here are the balance sheets for the nine preceding years, completing the ten year period on that. You asked for a statement of the real estate cost as appearing on the company's books.

Mr. BRENNAN: The witness has produced what purports to be an analysis of the real estate account as shown by the books of the com-

pany which the defendants ask to be marked Exhibit 22. It occurred to me that the witness may state upon the record what he has produced and state what years it is for, since our time now is somewhat limited.

A. I was asked to produce the balance sheets from the year 1900 to 1910. The balance sheet for 1910 ending December 31, is in my report, Exhibit 23. I offer the other nine balance sheets for the preceding nine years, which with the one in my report,
2108 cover the ten years called for.

Q. In reference to Exhibit 22, I see you have noted at the bottom the following: "This does not include land taken over at the time of the organization of the Des Moines Gas Company."

A. That is a part of that item of $285,000 which was paid for in bonds, consequently there is no voucher item or classification of it.

Q. Exhibit 22 shows the actual book cost of the real estate?

A. Exactly, the ledger analysis.

Q. What else have you?

A. You also asked for an analysis of the bond discount item to show the discounts on each specific sale of bonds. I offer an analysis of the bond account covering the life of the Capital City Gas Light Company and the Des Moines Gas Company down to the close of the calendar year 1910, showing such details. I was also asked to produce the balance sheet for the year 1886, that would be from the ledger which I have been unable to trace; the 1886 ledger was not offered to me in connection with my cost analysis and could not be provided. I have, however, taken the trial balance from the ledger of 1887 and by checking the charges and construction during the period covering the work, backwards, to the year 1886, I find the ledger for 1887 and the construction account as checked back for the actual charges for the year 1886, check exactly with the cost as shown in my report, schedule 1, Exhibit B.

Q. You have not produced your anlysis of the overhead charges, for the reason as explained by you on yesterday, that the company made no charges on its books?

A. There are no charges for that purpose.

Q. If there are any charges of that character, they are
2109 included in operating expenses?

A. Yes, sir; that is, there are no capital charges. In connection with these balance sheets for the last ten years, the request was made yesterday they be made in such shape that the working capital could be analyzed. In order to do that it would take several weeks' work. I have taken the average working capital shown in the last five years excluding 1911, and the average, not taking into account the growth of the company for that period, shows $196,348.82 for the last five years; that is, the five year period ending with 1910.

Q. Now, Exhibit 22 refers to certain special assessments or improvements made in the way of curbing and paving?

A. Yes, sir.

Q. Those were improvements that were made by the city of Des Moines and assessments made against the property therefor?

A. Yes, sir; and the company reimbursed the city for such expenditure; I believe that is the way it is done here.

Q. You do not understand that the company outside of any resolution of necessity or assessment made by the city, made these improvements?

A. I have no knowledge of that other than what appears on the company's books from which that exhibit is taken.

Excused.

Complainant rests.

At this time an adjournment was taken until 9:30 a. m. August 14th, 1911.

2110 Monday Forenoon Session.

AUGUST 14, 1911, at 9:30 a. m.

Counsel for the respective parties all present.

Defendants' Testimony.

A. O. HAUGE, being first duly sworn on part of defendants, examined in chief by R. O. Brennan, Esq., testified as follows:

Q. Where is your residence?

A. East Des Moines.

Q. How long have you lived in Des Moines, Mr. Hauge?

A. Nearly nine years.

Q. What is your business?

A. Banking business and real estate.

Q. With what bank are you connected?

A. With the Iowa Trust & Savings Bank.

Q. What official position do you hold in the Iowa Trust & Savings Bank?

A. I am cashier.

Q. How long have you been cashier of that bank?

A. Five years.

Q. Prioe to engaging in the banking business what other business have you followed, or did you follow?

A. I was cashier in the State Treasurer's office prior to that.

Q. For what length of time?

A. About three years.

Q. So that about five years you have been connected with the Iowa Trust & Savings Bank as its cashier and about three years in the State Treasurer's office?

A. Yes, sir.

2111 Q. To what extent, Mr. Hauge, during your residence in Des Moines have you bought and sold real estate either for yourself or for others?

A. I have been dealing in real estate for the last five years all the time.

Q. I will ask you if your position as cashier of the bank requires you to acquaint yourself with the market values of real estate and properties in the city of Des Moines?

A. It does.

Q. And that is by reason and on account of the fact that the bank makes loans from time to time?

A. Yes, sir.

Q. And before the loans are recommended by the board of directors, is some investigation usually made of the condition of the property and its value?

A. Yes, sir.

Q. And under whose supervision are such investigations made?

A. Under my supervision.

Q. Does your experience in real estate and the values of real estate extent over the city generally?

A. Yes, sir; quite generally.

Q. And have you any peculiar experience with reference to East Des Moines?

A. I have more experience in East Des Moines than in any other parts of the city.

Q. Were you asked by counsel for the city in this case to make an examination of the real property of the Des Moines Gas Company?

A. No, sir.

Q. For the purpose of having you make a valuation of the same?

A. No, sir.

2112 Q. When was your attention first called to the real estate of the Des Moines Gas Company?

A. About a month ago, special attention was called to it at that time—about five weeks ago, I should judge.

Q. And did you in pursuance of the request of some one visit the property of the Des Moines Gas Company?

A. I did.

Q. For the purpose of ascertaining its true market value?

A. Yes, sir.

Q. I will ask you Mr. Hauge, if in the course of your business you know what the reasonable market value of real property is in East Des Moines?

A. Yes, I think I know.

Q. What would you say as to whether or not you are acquainted with the reasonable market value of real estate owned by the Des Moines Gas Company in East Des Moines where its manufacturing plant is located?

A. I am.

Q. I mean exclusive of any buildings thereon?

A. Yes, I don't know anything about the buildings.

Q. But you do know what the real estate is worth exclusive of the buildings?

A. Yes, sir.

Q. Now, I first call your attention, Mr. Hauge, to Lots 9 and 10

in Block C of Scott & Dean's Addition, being the lots abutting upon East Second Street, Lot 10 running the long way on Market Street?

A. That has frontage on the K. D.

Q. Yes. Have you examined those lots to which I have

2113 called your attention?

A. Yes, sir.

Q. You may state what in your judgment was the reasonable market value of those lots say on or about January 1, 1911?

A. I should say $10,000.

Mr. READ: For the two?

A. For the two lots, yes.

Mr. BRENNAN: I show you a plat which is marked Exhibit 5 in this case, I believe, and call your attention to Lots 9 and 10 in Block M, and you will please state what in your judgment was the reasonable value of the two lots in Block M, to which I have called your attention on or about January 1, 1911?

A. $6,000.00.

Q. I wish now to call your attention to Lots 9 and 10 in Block B Scott & Dean's Addition shown upon this plat, Exhibit 5, and please state what in your judgment was the reasonable market value of those lots at or about the time to which your attention has been called?

A. $8,500.00.

Q. I will call your attention to Lots 3, 4, 5, 6, 7 and 8 in Block B Scott & Dean's Addition; please tell the Master what in your judgment was the value of those lots?

A. Of all those lots?

Q. Yes.

A. $22,000.00.

Q. I call your attention Mr. Hauge to lots 1, 2, 3, 9 and 10 in Block C, Scott & Dean's Addition——

A. We started with 9 and 10.

Q. I want you to put a valuation on the five lots; tell the Master what in your judgment was the reasonable market value of the five lots to which your attention is called?

2114 A. $20,000.00.

Q. In the same block, C, I call your attention to Lots 4, 5, 6, 7, & 8; please state what in your judgment was the reasonable market value of those lots?

A. $25,000.00.

Q. Did you place a valuation upon Lots 3 and 4 in Block K, Scott & Dean's Addition?

A. Yes, sir.

Q. Will you please state what in your judgment was the reasonable market value of Lots 3 and 4 in Block K.

A. $12,000.00.

Q. I notice on this plat, Exhibit 5, five lots in Block T known as Lots 3, 4, 5, 6 and 7, fronting upon East First Street and adjacent to the Des Moines river; did you make a valuation of those lots?

A. Yes, sir.

Q. Please tell the Master, Mr. Hauge, what in your judgment was

the reasonable market value of Lots 3, 4, 5, 6 and 7 in Block T, Scott & Dean's Addition at or about January 1st, 1911?

A. That makes five lots there.

Q. Yes; 3, 4, 5, 6 and 7?

A. $3,500.00.

Q. Now, Mr. Hauge, it is a mere matter of adding up the figures you have given, but I would like to have you state upon the record what the aggregate total amount of your valuation is of the real estate of the Des Moines Gas Company to which I have called your attention?

A. $97,000.00.

Q. And that you tell the Master to be in your judgment the reasonable market value of this property exclusive of buildings
2115 and improvements?

A. Yes, sir.

Cross-examination by W. L. READ, Esq.:

Q. Prior to engaging in business with the bank, you had had no experience in real estate in Des Moines, had you?

A. Some.

Q. How much?

A. Just individually, was all. What I purchased myself.

Q. That was where, and what character of property?

A. Residence property.

Q. Out on the east side?

A. No, the west side.

Q. What part of the west side?

A. Over near Forty-second street.

Q. How many properties?

A. Three.

Q. Improved properties or vacant properties?

A. Those were vacant properties at the time.

Q. What is the capitalization of your bank?

A. Fifty thousand dollars.

Q. You are conducting a regular banking business?

A. Yes, sir.

Q. And your time is chiefly engaged in that?

A. Yes, sir.

Q. To what extent do you make loans on real estate?

A. Well, all we are able to in our business.

Q. I know, but to what extent, what volume?

A. Well, we make, I should say forty per cent of our
2116 loans are real estate loans.

Q. What would forty per cent amount to per year?

A. From $200,000 to $250,000; that is the total amount.

Q. Forty per cent of that would cover the real estate loans?

A. No, the total amount of loans would be between $500,000 and $600,000.

Q. On what character of real estate are your loans made upon?

A. On all kinds of real estate.

Q. Chiefly what kind?

A. Chiefly in the city.
Q. On residence property?
A. Both residence and business.
Q. You make any farm loans?
A. Some.
Q. The bulk of your loans are on residence property?
A. No, sir.
Q. The bulk are on business property?
A. No, sir.
Q. Upon what?
A. I think they are pretty evenly divided between residence and estate loans.
Q. Aside from your commercial loans the bulk of the real estate loans are on residence property?
A. I think they are pretty evenly divided between residence and business; I wouldn't be able to say positively.
Q. Have you made any loans within the district, say south of Court Avenue and west of Fifth Street and the river?
A. South of Court?
Q. South of Court?
A. I wouldn't say positive about that; I haven't made
2117 any south of the tracks; I may have made south of Court, I wouldn't say positively.
Q. Have you now any recollection ever having made a loan in that district?
A. No, I have not.
Q. Have you ever had any experience in handling property in that district in East Des Moines?
A. Yes, sir.
Q. In the district south of Court Avenue, west of Fifth street, between that and the river and north of Elm Street?
A. We have had property listed but never bought or sold any.
Q. You never bought or sold property in that district?
A. No, sir.
Q. What is your realty firm?
A. The Union Realty Company.
Q. How long has that been organized?
A. About two years.
Q. And is engaged in handling that kind of property?
A. It has a residence tract of its own and handles property for others.
Q. Its business is chiefly the exploitation of residence tracts?
A. Ground, so far as its holdings are concerned.
Q. Have you or your company ever been interested in handling business property in West Des Moines?
A. I don't think we ever sold or bought in West Des Moines.
Q. To what extent have you bought or sold business property in East Des Moines.
A. We sold a few and bought some.
Q. Well, where have your sales been?

A. Personally, I bought some in East Des Moines on Locust street.

2118 Q. Did the company buy or sell any?

A. No, sir.

Q. You personally bought some on Locust Street?

A. Yes, sir.

Q. Where on Locust Street?

A. Between Second and Third.

Q. How recently?

A. I think it is 1908—I am not positive as to that.

Q. What were the character of the properties?

A. They were vacant lots when I got them.

Q. What size lots?

A. 22 by 132, I think.

Q. How many lots?

A. Two of them.

Q. There has been quite a marked advance in properties along on Locust street, hasn't there?

A. Yes, there has.

Q. Also on Walnut Street?

A. Not so much.

Q. Also on Court Avenue?

A. No, not so much as Locust.

Q. There has been quite a marked advance on First, Second and Third, between Court Avenue and Locust Street, along in there?

A. Yes, since it was cleaned up, yes a marked advance in that property.

Q. There have been some improvements over there that have had a marked effect on the advance in the prices, isn't that true?

A. Yes, sir.

Q. What improvements are those?

A. The City Hall, the Locust street bridge and the raising of the grade of Locust Street.

2119 Q. The Coliseum?

A. Yes, sir.

Q. The Park on the East side?

A. Yes, sir.

Q. The new Walnut Street bridge is also a factor?

A. That will be a factor.

Q. Recently there has been some improvements projected in the way of a switch between Court Avenue and Vine?

A. I don't know about that; I think that was while I was away.

Q. You don't know anything about that?

A. I don't know anything about that.

Q. Now, those few lots on Locust Street are all that you ever bought in East Des Moines?

A. Yes, sir—not in East Des Moines—all the business lots.

Q. Have you been interested or acted as agent in selling any property in East Des Moines?

A. Yes.

Q. How many and what properties?

A. I sold two corners on Grand Avenue and Fifth Street.
Q. Anything else?
A. I can't recall it now; I am quite sure I have sold others; not on the spur of the moment, I don't recall any; I may later on.
Q. Are you acquainted with values in West Des Moines?
A. I think so, from observation and keeping in close touch.
Q. Out on Mulberry Street, at Seventh and Eighth, what are properties worth out there?
A. A good deal more than in East Des Moines.
Q. Well, how much?
A. Seventh, you say, and Mulberry?
Q. Yes, and south; take the Scheuerman Brothers' prop-
2120 erty, what is that property worth?
A. I don't know how much ground there is; I never was down there.
Q. It is a quarter block there.
A. That is on the Rock Island, is it?
Q. I believe it is, it is trackage property.
A. I am not sure where that is.
Q. Do you know the values of any of these properties in and around that vicinity?
A. I know what the Ellingson property sold for.
Q. That was a bargain counter affair?
A. I don't know anything about that.
Q. You just know what it sold for?
A. Yes.
Q. Do you know the property?
A. Yes, I have been in and through that.
Q. When did it sell?
A. Well, it wasn't very long ago.
Q. How long ago?
A. I think within the last year.
Q. How much property was there?
A. I think that was a quarter block.
Q. Where is it?
A. Right over in here. (Indicating on the map.)
Q. On what street?
A. What track?
Q. What track and what street—that is Seventh Street in fact?
A. I think it is Seventh Street.
Q. Seventh Street and nearly down as far as Tuttle, isn't it?
A. It is down on the tracks.
Q. It isn't on the Rock Island; it is south of Elm Street, isn't it?
2121 A. I don't think so.
Q. Well, where is it?
A. I would say it was Vine Street, to the best of my recollection.
Q. Do you know what that sold for?
A. Yes.
Q. You don't know whether that was its fair market price or not?
A. I should say it was a fair price.

Q. Do you know whether it was its fair market price or not?

A. Yes, I would say it was the fair market price.

Q. You don't know anything about any of these other properties, the Scheuerman quarter block or the quarter block across the street?

A. No, I wouldn't attempt to place a value on them without inspection for that purpose.

Q. By looking at it would you venture an expression?

A. Yes, I would be willing to give you my opinion.

Q. What do you imagine the property where the Browne-Camp Hardware Company are located is worth down here?

A. On Court Avenue and First?

Q. Where their wholesale house is?

A. Well, I wouldn't place a value on that without inspection; I never was over the ground.

Q. What do you imagine the Warfield Grocery Company property is worth across the street south of Brown-Camp Hardware?

A. Faces on front?

Q. It has some, call it front and Court?

A. How much of it is there?

Q. 132 feet; how much by the foot?

A. Has it got trackage?

Q. Yes.

A. I would figure trackage there worth from $200 to $300
2122 a front foot; I would have to be indefinite about that.

Q. From $200 to $300 a front foot would leave a margin on it?

A. Yes.

Q. Take the Brown-Camp frontage, how much is that a front foot?

A. That hasn't got trackage.

Q. It has trackage, a switch through there, assume that.

A. That has frontage on Court too?

Q. Yes, it corners on First and Court.

A. Well, I wouldn't care to place a value on that without inspection; I can't recollect right now——

Q. You know where it is?

A. Yes, sir.

Q. As well as you do the Warfield property?

A. Yes, sir.

Q. And is that worth more or less than the Warfield property?

A. If the Warfield property—I haven't got it clear in my mind now—if I had a map I could tell you more about it. I should say if it has Court avenue frontage besides trackage, it is worth a little more.

Q. Maybe this map, Exhibit 6, can help you out some.

A. The Brown-Camp is south of Court, isn't it?

Q. It is on the north side of Court, the corner of Court and First; my inquiry is as to the value per front foot?

A. I should say it would be worth fifty dollars more than the other with the same trackage facilities.

Q. The range would be about where?
A. From $250 to $350.
Q. Do you know where the Kratzer Carriage property is?
A. I am not so sure about that either.
Q. Well, it is south of Court Avenue just west of the west
2123 bank of the river from the Gas Company property.
A. On Vine Street?
Q. Yes, have you any idea what that is worth?
A. 132 feet depth, is it?
Q. It is trackage property, about the usual width 132 feet?
A. I should say that would be worth from $200 to $250 a front foot, somewhere along there.
Q. Going back to the Ellingson property, what is that property worth now?
A. The Ellingson over here on Seventh?
Q. Yes.
A. I would say it would be worth about what it sold for, in that neighborhood.
Q. What do you say it is worth now?
A. Just the ground alone, you mean?
Q. The ground alone.
A. I should say from $65,000 to $75,000.
Q. That is a quarter block?
A. That is what I was figuring.
Q. That includes the improvements, does it?
A. No, I was figuring that.
Q. The Ellingson quarter block value now you say is about how much?
A. From $60,000 to $70,000; $60,000.
Q. The Scheuerman property, you don't know where that is?
A. I don't know anything about that.
Q. The Des Moines Ice Company property, do you know where that is?
A. I don't know where that is.
Q. You purchased on East Locust Street in 1908. I think you stated?
A. I think so, I wouldn't say positively.
Q. There has been quite a marked advance since that time?
2124 A. Yes, quite a little.
Q. How much, speaking in percentages?
A. About sixty per cent on Locust Street.
Q. What is the percentage of advance on Walnut Street?
A. About forty on the East side.
Q. Directly your attention to West Locust Street, what has been the advance on West Locust Street from Eighth to the river, in the last five year.?
A. It has been more.
Q. How much more?
A. Well, I am not so familiar with that; I wouldn't know offhand.

Q. What is the general range of values on West Locust Street, say from Eighth Street east to the river?

A. About the average you mean?

Q. No, the range, the maximum and minimum?

A. I would say from $200 to $1,000 a front foot.

Q. Where would you locate the $1,000 a front foot property on Locust Street?

A. About where the Equitable Building is, between Seventh and Fifth in there somewhere; I may be a little high.

Q. How much high do you think that would be?

A. O, I think that is about right.

Q. Let us see, in your judgment property on West Locust Street, say the corner of Sixth Street is about $1,000 per front foot?

A. That would depend on whether you have a corner or an inside lot.

Q. Take the Equitable property?

A. I should think that would be worth that much.

Q. Now, going east toward the Coliseum, how much a front foot is it down there?

A. That is where I placed the $200 property.

2125 Q. On West Walnut Street from Eighth east to the river, what is the general range of prices?

A. Well, I should say from $250 a front foot to $2,500.

Q. $2,500 a front foot would be where?

A. The Fleming corner.

Q. The $200 a front foot would be down by the river?

A. Down by the river; there is no $200 front foot down by the river. It is improved; we have got the Post office on one side and the Library on the other.

Q. It runs down to that level to the block west of that?

A. Yes, the further west the more valuable.

Q. This property of the Des Moines Gas Company has trackage facilities?

A. Yes, sir.

Q. Do you count that a factor making for value?

A. Yes, sir.

Q. Does it make much difference?

A. Yes, it makes difference to the owner that wants trackage.

Q. Does it make any difference in your estimate; do you call it worth more because of the trackage than without it?

A. No, it wouldn't be worth more as compared with the Fleming Building.

Q. No, not by comparison; is the Gas Company property in your judgment and estimation worth more with trackage than without trackage?

A. Yes, in that location it is.

Q. What do you conceive are the available uses of this property?

A. About all it could be used for is factory purposes, storage purposes, purposes in connection with railroad trackage.

Q. It is adapted for such uses?

A. Yes, I should say it would be.

Q. And rather well adapted, isn't it?

A. All except the lowness of the ground; if it was higher
2126 it would be worth more.

Q. Is the Des Moines Gas Company property subject to overflow?

A. I don't think the overflow ever went over there; it has overflowed around it though, which affects this property, that would be an island.

Q. Where does the overflow come around it, south of it?

A. Yes, it used to overflow north of it.

Q. It is not within the overflow district now north of it, is it?

A. I am not sure whether Walnut would be overflowed under the present conditions or not.

Q. Isn't it true that the overflow ground is south of Elm street?

A. The lowest overflow ground, yes.

Q. Aside from some sink holes is there any overflow ground north of Elm street and west of Fifth street?

A. Since Locust Street has been raised we haven't had any floods; I couldn't say just exactly; I am not an engineer. There was water on Walnut Street during the flood.

Q. Do you regard the Des Moines Gas Company property as being adapted for factory purposes, storage purposes and such like?

A. Yes.

Q. Well adapted?

A. Quite well adapted.

Q. To what extent is the ground over there already appropriated and in use?

A. Well, with buildings on, I don't think there is half of it appropriated.

Q. Will you take the map and point out where there is an unappropriated piece of ground south of Court Avenue and west of Fifth street to the river and North of Elm street?

A. Some of this Gas Company property is really not ap-
2127 propriated very much; they have got a couple of tanks on it.

Q. Well, outside of the Gas Company property?

A. This map only goes to Third street.

Q. Let us consider then what the map shows.

A. There is unappropriated ground over in here (indicating).

Q. What block is that?

A. I couldn't say exactly; east of Third and south of Market. And all of this ground the great part of that ground over there the improvements on it are not of a permanent character; they are shacks a good many of them.

Q. What ground are you talking about when you speak in that way?

A. I am not talking about the Incubator Factory over there, is not a permanent building; the Prouty Soap Works over here has got a building which is pretty fair.

Q. I haven't asked you with respect to the character of the buildings; I have asked you to point out unappropriated ground not in use.

A. I presume it is all being used a little bit; some of it has got scraps of iron on it.

Q. There is an iron concern over there?
A. Yes.
Q. Is there any considerable area over there that is not now in use?
A. Well, I wouldn't positively say about that; they may be used as much as the Gas Company there with one of those oil tanks on it, just a small tank, and that would be in a sense appropriated to a very limited extent.
Q. What tracts are there over there on the market for sale?
A. There is one east of Third and south of Market.
Q. Will you name it, describe the tract?
A. I just looked at the tract.
2128 Q. That is east of Third and south of Market?
A. Yes, sir.
Q. Is that the only one you know of?
A. That is the only one I inquired into.
Q. You do know there is a great deal of ground in there that is appropriated and used for railroad purposes?
A. Yes, sir.
Q. And you do know in a general way most of that ground in the district I have called your attention to is already appropriated and in use, don't you?
A. Well, it is being used, but it is not built up; that is what I have reference to.
Q. You do know there are not any considerable tracts on the market for sale in that district?
A. I don't know of very many, no.
Q. Suppose, Mr. Hauge, you had a customer for two blocks of contiguous trackage property, where would you find it over there?
A. Further east.
Q. How far east?
Q. You can follow the tracks down and find it somewhere.
Q. You could find it if you had to go to Altoona for it?
A. Yes.
Q. Where would you find it in the district I have described south of Court Avenue and west of Fifth or Sixth Street, if you please?
A. I do not believe we could find it all belonging to one person; you would have to buy it up from different parties.
Q. You don't know of any tract so large as that owned by one person or a tract so large as that that is on the market for sale, do you?
A. No, I do not.
Q. Do you know of any such tract in west Des Moines or
2129 trackage property, aside from the holdings of the Hubbell Estate?
A. No, sir; I do not.
Q. You couldn't get it in town, could you?
A. Not that I know of unless you go further east.
Q. The truth of the matter is, close in desirable trackage property is a scarce article?
A. Well, it is all owned by somebody and most of them are not very anxious to sell.

Q. I was speaking, aside from the Hubbell holdings, the close inside trackage property is scare, isn't it?

A. Yes.

Q. And there is a good demand for it?

A. Well, I don't know as to the demand; I haven't been asked, I haven't seen very many purchasers.

Q. There is an increasing growth in the manufacturing business in Des Moines?

A. Yes.

Q. Quite a stimulus?

A. There has been the last three or four years.

Q. And the storage business has called for the construction and they have been constructing large warehouses?

A. Yes, sir.

Q. Now, that property of the Gas Company is not far from the post office, is it?

A. No, it is not very far from the post office.

Q. It is really desirable property Mr. Hauge?

A. For the purpose I have described it is.

Q. For the use?

A. It is all right.

Q. Close in?

2130 A. Yes, sir.

Q. Accessible from the paved streets, Walnut Street, Locust Street and Court Avenue a short distance?

A. Yes, sir.

Q. And all in all it is for such use and such purpose a desirable property?

A. Yes, sir.

Q. How long did you spend inspecting the property of the Des Moines Gas Company?

A. The first time I was down there I was down there about a half a day; the second time I was there about two hours and a half to three hours.

Q. Was anyone with you?

A. One time there was.

Q. Who was with you?

A. Frank Mathis, Mr. Walker and Mr. Wilcoxen.

Q. Bye the bye, in placing your appraisal what question did you ask yourself; what did you put the question—what could this lot or this lot *or this lot* be sold at as a separate lot?

A. I took the quarter blocks; I took them by quarter blocks.

Q. Just as you have given them in your answers?

A. Yes, sir; I wouldn't say positively how I gave them in the answer.

Q. With reference to what assumed or supposed uses did you make the estimate?

A. Oh, general trackage purposes.

Q. Suppose, Mr. Hauge, there were no Gas Company in Des Moines and that the people were projecting the construction of a gas plant and were to come over there and desire, say two blocks of ground within the district I have described, south of Court Avenue

and west of Fifth and Sixth Streets and north of Elm Street,
2131 and they should commission you to buy two blocks in there, what prices do you suppose you would have to pay for it?

A. I would get it as cheap as I could.

Q. What would be the price?

A. It may be impossible to buy two blocks, if it was owned by different parties.

Q. If you would pay enough you could get it?

A. Not always; some of the Hubbell tracts are not for sale.

Q. What do you imagine now would be the cost of collecting under one ownership two blocks of ground contiguously situated within that territory south of Court Avenue and west of Fifth Street and north of Elm Street?

A. About $100,000.

Q. Well, now what property would you get and where would you get it?

A. I haven't started that job yet.

Q. Start out and point out where it is?

A. I would get the one easiest——

Q. Make a start, tell us wher*h*e you are going to begin and end?

A. That would be impossible for me to tell you how I would do it; that would take some time and energy.

Q. You say about $100,000 would buy it and you say you haven't any idea where you can get the ground, from whom you can get it; why do you venture the statement that you could get it for $100,000?

A. If you could get it at all, you ought to get it for $100,000.

Q. Why?

A. That is what I consider it is worth.

Q. Supposing you had property owners that wouldn't sell it for that?

A. They may over-estimate it.

Q. A man who owns property has to get his price before he sells it?

A. Yes, sir; he don't have to sell it.

2132 Q. I am putting it to you, Mr. Hauge, whether after all you would not have to give something more than $100,000.

A. I think that $100,000 would buy two blocks in there if there was two blocks for sale.

Q. That is because that is what you think it is worth?

A. Yes, sir.

Redirect examination by Mr. BRENNAN:

Q. Mr. Hauge, if you were going to plan for a site for a gas works, you would not be confined to the two blocks now occupied by the Gas Company, would you?

A. I shouldn't think so; I don't know anything about the gas business.

Q. I wish you would tell the Master in a general way, without too much detail, where there are in East Des Moines factory sites for property which is adaptable for factory purposes.

A. Well, there is large tracts clear to the city limits

Q. Well, tell the Master about where they are located and the size of the tracts.

A. On the Northwestern road there are tracts of land from East Fourteenth Street up to and beyond Hull Avenue a distance of two miles northeast; there is ground up in there that can be bought for $300 an acre; probably less; I can buy it for $250 today. The Short Line, the Rock Island, runs through it, and the Northwestern runs through it and the Great Western runs through it.

Q. The Short Line is the Des Moines & St. Paul?

A. Yes, sir.

Q. What is the fact whether or not there are manufacturing establishments already located in that part of the city?

2133 A. There are in that vicinity, not on these tracts.

Q. Tell the Master the character of the factories that are now located in those places?

A. There is a threshing machine factory up in there——

The MASTER: Where are they with reference to the Sixth Avenue bridge?

A. They are east of the Sixth Avenue bridge; they are on the line towards Marshalltown.

Q. It lies north and west of the Fair Ground?

A. Yes, it is west and north of the Fair Ground, on Delaware Avenue, what would be about Twentieth Street.

Q. The Des Moines & St. Paul and the Great Western at that point run almost due north and south?

A. Yes, sir.

Q. And then west of the territory to which you have called attention are there any factory sites, going over towards Highland Park and towards Sixth Avenue bridge?

A. Yes, sir; there are switches that could be run over in there I presume.

Q. Does the Interurban serve that territory now?

A. It serves it across from the east in over west.

Q. Do you know whether or not the Interurban carries on a freight business in connection with its passenger business?

A. I see them carrying freight, yes sir.

Q. Now, going out on East Walnut Street or East Grand Avenue, are there any factories in that vicinity?

A. Yes, sir.

Q. What is the character of the factories in that part of the city?

A. Well, there is a peanut roaster factory and the hosiery mills further out, and I believe the Des Moines Bakery is going to

2134 put up a plant about Twentieth, I have been informed by the owner.

Q. Those properties are all served by railroads, are they not?

A. Yes, sir.

Q. Then going south of Court Avenue where the Agar Packing plant is located, are there some factory sites in that part of the city?

A. Yes, sir; there is trackage along in there, trackage on the Rock Island out towards the Fair Ground.

Q. All the railroads aside from the Northwestern and Milwaukee,

in reaching the city, parallel, do they not, the tracks of each other in entering the city from the east?

A. The Great Western I don't believe goes straight east, it goes on up when it gets to Twentieth Street.

Q. When it reaches the crossing near Twentieth street then it runs parallel to the other railroad tracks?

A. Yes, sir.

Q. And there are the Des Moines & St. Paul, the Great Western, the Rock Island, the Wabash, the Keokuk & Des Moines, and the Burlington?

A. Yes, sir.

Q. And there are factory sites in the vicinity of all these railroads?

A. Yes, sir.

Q. Spurs and switches?

A. Yes, sir.

Q. So that if I understand you, Mr. Hauge, if you were going to locate a gas works in Des Moines, you would not be confined to the particular two blocks to which counsel has called your attention?

A. No, I should not think they would have to be confined to two blocks; if they would go out where we are talking now,
2135 you could buy it for less than $100,000.

Recross-examination by Mr. READ:

Q. You could still find trackage property if you would go as far out as Borwick or Altoona?

A. I would confine myself to the city of Des Moines.

Q. Within proper limits?

A. Yes.

Q. Assuming there are prackage properties in the outlying districts, nevertheless the fact is there is a demand, to some extent at least, for inside trackage property, isn't there?

A. Well, I don't know that; I have had some——

Q. That answer- the question.

A. I don't know of any particular amount of demand there is for trackage; they are definitely decided whether they want to go one plave or another.

Q. There are certain businesses, such as storage that requires to be inside?

A. Yes, sir.

Q. For instance, we have large storage houses in the west Des Moines district?

A. Yes, sir.

Q. I think there is one in the east Des Moines district too?

A. Not a very large one.

Q. For such uses as that it would be impracticable to go out into the outlying districts?

A. For storing city goods it would be impracticable.

Q. Merchandise and such things as that?

A. Yes, sir.

2136 Q. Or if you were manufacturing and your business was such that you wanted to come in contact with the buying public, it would be desirable and a necessity?

A. The closer in the better.

Q. If you were going to locate a gas plant you would think about it a good while if you didn't know anything about it?

A. I don't know anything about gas plants, no.

Q. What you were undertaking to do was to point out grounds that were served by tracks in the outlying remote districts of the city?

A. Yes, sir; about fifteen blocks away from this.

Q. From fifteen to thirty?

A. Yes.

Q. Now you suggest that properties out there are cheaper than the inside?

A. Quite a little.

Q. Nevertheless if a man wants inside property, why of course that is the only kind that he would be satisfied with; he may be mistaken in his judgment as to what he wants, and there have been people located in the inside too?

A. Yes, sir.

Q. And that gives to inside trackage property a certain value?

A. Yes, sir.

Q. Now, I surmise, Mr. Hauge, that you may have been over-conservative in your valuation of the Gas Company property because of some theory in your mind that the existence of this property outside tends to cheapen the inside property?

A. I did not have that in mind at all when I appraised the property on the east side there. I didn't have the other trackage in mind.

Q. What was the basis of your valuation of the gas property?

2137 A. My general knowledge of real estate values in that vicinity and inquiries I made as to sales that had been made in years gone by, and what is on the market now for sale.

Q. What is there on the market for sale; I asked you that?

A. I found one quarter block east of East Third Street that could be bought for about $7,000; 132 feet on the K. D.

Q. Will you describe that quarter block?

A. It is not on this map.

Q. In what block is it?

A. It is south of the K. D. and east of East Third.

Q. Is it in the corner of the block?

A. It corners on Third.

Q. What other street?

A. And Market.

Q. Is it low or high ground?

A. It is about like all that ground in there, except the Gas Company's ground is a little higher; it has been filled in.

Q. Who owns that property now?

A. I don't know; I talked with the agent who had it for sale.

Q. Who is the agent?

A. Mr. Wilcoxen.

Q. Mr. A. S. Wilcoxen?

A. Yes.

Q. Was he down there inspecting the gas property when you was there?

A. Yes, sir.

Q. He told you he had this quarter block for sale for $7,000?

A. As I recall it, that is what he could sell it for; he had been trying to sell it for that for a long time and couldn't sell it; 132 feet on the N. D.

Q. And so you concluded that property was as good as the gas property?

A. No.

2138 Q. That at least was the basis of your valuation of the gas property?

A. Not altogether.

Q. What else?

A. My general knowledge as to real estate values in that and other parts of the city.

Q. Such as you have disclosed here in your examination?

A. Yes, sir.

Excused.

B. S. WALKER, being first duly sworn on part of defendants, examined in chief by R. O. Brennan, Esq., testified as follows:

Q. Where do you reside?

A. 1525 Columbus Avenue, Des Moines, Iowa.

Q. How long have you lived in Des Moines?

A. Thirty years.

Q. What is your business?

A. Real estate.

Q. How long have you been engaged in the real estate business in the city of Des Moines?

A. Twenty-eight years.

Q. Practically continuously?

A. Yes, sir.

Q. Were you formerly connected with any real estate firms before engaging in business on your own behalf?

A. Yes, I was with the firm of Percival & Hatton for eleven years.

2139 Q. What was the nature of the business conducted by Percival & Hatton?

A. General real estate business in all lines.

Q. In the city of Des Moines?

A. Yes, in the city of Des Moines.

Q. State whether or not it was one of the leading real estate firms in the city?

A. It was so considered.

Q. How long have you been engaged in the real estate business on your own behalf?

A. Since 1892.

Q. Have you purchased property for yourself and for others during that time?

A. I have.
Q. And sold properties?
A. Yes, sir.
Q. Business properties and residence properties?
A. Yes, sir.
Q. Have you confined your business to any particular part of the city, side of the river?
A. My personal business has been confined largely to the south side. As one of the trustees of the Joseph B. Stewart Estate we have owned property on the east and west side of the river.
Q. By reason of your relation as trustee of that estate were you called upon in the course of your business to purchase or sell real estate?
A. We had to sell it.
Q. You have kept in touch with the market values of real estate in Des Moines?
A. I have endeavored to.

Q. You may state whether or not you are acquainted with
2140 the reasonable market value of real estate in the city of Des Moines?

A. I think I am.
Q. Do you know the property of the Des Moines Gas Company?
A. I do.
Q. You have known that property for a good many years?
A. Yes.
Q. Did you investigate that property some time ago for the purpose of placing a valuation upon the same?
A. I did about a month ago.
Q. I will ask you whether or not you know what a reasonable market value of that property is and was say about January 1st, 1911.
A. I think I do.
Q. And please tell the Master what in your judgment was its reasonable market value?
A. Speaking as a matter of lots or the aggregate?
Q. The aggregate, and then we will take up the lots?
A. I made the aggregate valuation $97,500.
Q. Now, the map which is before you there Mr. Walker, Exhibit 5, being a blue print showing the location of the Des Moines Gas Company property, within the tracts outlined by the red borders, I will call your attention to Lots 9 and 10 in Block M of Scott & Dean's Addition to the City of Des Moines, and I wish you would tell the Master what in your judgment was the reasonable market value of those lots on or about January 1st, 1911?
A. $6,000.00.
Q. Now referring to Lots 9 and 10 in Block B——
A. $8,500.00.
Q. I call your attention to Lots 3, 4, 5, 6, 7 and 8 in Block B and please state what in your judgment was the reasonable market value of those lots about January 1st, 1911.

2141 A. $20,000.

Q. Referring now to Lots 1, 2, 3, 9 and 10 in Block C,

Scott & Dean's Addition, please tell the Master what the reasonable market value of those lots was on or about January 1st, 1911?

A. $22,000.00.

Q. Now referring, Mr. Walker, to Lots 4, 5, 6, 7 and 8 in Block C of Scott & Dean's Addition, please tell the Master what in your judgment was the reasonable market value of those lots on or about January 1st, 1911?

A. $25,000.00.

Q. Now, referring to Lots 3 and 4 in Block K of Scott & Dean's addition, please tell the Master what in your judgment was the reasonable market value of those lots at the time at which your *your* attention was called?

A. $12,000.00.

Q. Lots 3, 4, 5, 6 and 7 in Block T, Scott & Dean's Addition, what in your judgment was their reasonable market value?

A. $4,000.00.

Cross-examination by W. L. READ, Esq.:

Q. Your activities in the real estate business for a great many years have been chiefly confined to exploiting some property of your own in South Des Moines?

A. Yes, sir.

Q. Residence property?

A. Yes.

Q. In fact you have not been at all active in the general real estate business during that time?

A. Well, not in the general business; I have sold some of
2142 my own properties during that time in other parts of the city.

Q. Residence properties?

A. No, some business properties.

Q. Where?

A. On Second & Chestnut Street-, southwest corner of Second and Chestnut Streets, I sold a piece of property there five or six years ago.

Q. Have you bought or sold any business property in East Des Moines?

A. We have t-ied very desperately to sell some but were not successful.

Q. Where?

A. On Grand Avenue.

Q. Where on Grand Avenue?

A. The second lot on Front on the north side of the street, 40 feet on Grand Avenue between Sixth and Seventh and property out at First and Des Moines Street-; and then property on Des Moines between Sixth and Seventh; those were Stewart Estate properties.

Q. Have you handled anything on East Locust Street or Walnut Street or Court Avenue or Elm, Vine or Market?

A. No.

Q. East of Sixth street—you say no?
A. No.
Q. Have you known of any property in that district selling in the past five years?
A. Yes.
Q. Where?
A. This property spoken of here, Lots 9 and 10 in Block M; I noticed that sold for $4500.
Q. How long ago?
A. That is within four or five years, by Mr. George Wright to Mr. Jansen Haines.
2143 Q. You don't know when that sale was made?
A. I don't know at this moment.
Q. Do you know of any other property?
A. Yes, four and five in Block C sold by Rowett to Ben Younker.
Q. How long ago was that?
A. Five years I think; for seven thousand dollars.
Q. Any others?
A. These are all I have looked up.
Q. There has been quite a marked advance in the price of real estate in East Des Moines on Locust Street and Walnut Street in the last two or three years?
A. Well, there has been a theoretical advance on Locust; as to actual sales I have no memory of sales being made at an advance. The raising of the grade on Locust Street has changed the actual value and created a sentimental advance.
Q. That is to say, the holding price has advanced?
A. The holding price has advanced.
Q. When the sales are made they will necessarily be made at an advanced price?
A. Yes.
Q. How much of an advanced price?
A. That is problematical. Of course it was very dead over there. I should think probably an advance of fifty per cent over the prices on Locust Street before the bridge was built and the grade raised. The raising of the grade to my judgment added a greater factor than any other item.
Q. There has been a marked advance in the price of real estate and business property, inside properties in west Des Moines?
A. There has been in West Des Moines, marked.
Q. What is the range of prices on Locust Street do you
2144 suppose from Eighth Street east to the river?
A. I presume the choicest properties would seel there for $3,000 a foot and range down to Front street, I presume about $500. I put the range between $500 and $3,000
Q. Take the corner on Locust Street, the property on which the Equitable building is located, what is that worth per front foot.
A. That property is easily worth $3,000 a front foot.
Q. What is the range of prices on Walnut Street from Eighth east to the river?
A. Well, you have taken, with the Equitable Building, you have

taken in my judgment the choicest spot on Locust Street and on Walnut there is some property that is worth in the neighborhood of $3,500.

Q. The Fleming Block corner?

A. Yes, that is $3,500.

Q. Harris-Emery?

A. That is not quite so good, a little further west. My theory of values is that there is always a north and south axis in every city; Sixth Avenue is the north and south axis.

Q. You know where the Brown-Camp Hardware building is and the Warfield Grocery?

A. Yes.

Q. What are those grounds exclusive of the buildings worth per front foot?

A. Well, I should think those properties, exceptionally fine location, in the neighborhood of $600 per front foot.

Q. Do you know where the Kraetzer property is?

A. Yes, sir.

Q. What is that?

A. That is a much cheaper property; that is simply a
2145 manufacturing property; the other- have a business element. That would be about $250 per front foot in my judgment.

Q. The Scheuerman Block, do you know where that is?

A. Yes. It is south of the Rock Island on the east side of Eighth Street.

Q. Do you know the values down in there?

A. There is a peculiar situation there, where the railroads have to help them; some of these days they can be very strenuous in their prices; they have that as a market feature.

Q. The Ellingson property, do you know where that is?

A. Yes, sir.

Q. Do you know what that is worth?

A. It has been sold recently to the Rock Island road. There is 132 feet square, if I recall it. I don't remember the consideration; in my judgment I should say $300 probably $45,000 or $50,000.

Q. That was bought within a year or two for this money?

A. I didn't notice the transfers on that; I noticed the stories on it.

Q. Precisely where is the Ellingson property situated?

A. At the southwest corner of Seventh and Vine Street.

Q. Do you know where the Des Moines Ice Company property is?

A. Fronting over the old artificial ice plant, over on Ninth street.

Q. West Ninth Street?

A. West Ninth Street.

Q. What other street?

A. I don't recall definitely whether that is south in that same block or a block south; my impression is it is in the same block.

Q. Do you know what it is worth?

A. No, I don't remember now just how it is situated as to railroad

access, nor do I know the size of it, but if it were given railroad trackage it would be of the same value as the Ellingson, the
2146 Ellingson property is on Seventh Street. It would be two blocks west, facing west and this Ellingson property faces east.

Q. Inside trackage property in Des Moines has a value hasn't it?

A. Yes, there is the same distinction in my judgment between inside trackage and outside trackage, as there is between inside retail and outside retail.

Q. Aside from the holdings of F. M. Hubbell or the Hubbell Estate, south of Vine street in that district, are there any considerable areas of trackage property unappropriated?

A. No, the fringe is very narrow between what Hubbell owns and the retail business.

Q. In east Des Moines south of Court Avenue, west of Fifth Street and north of Elm Street, what is the extent of unappropriated trackage property?

A. Elm street being the line of the Q. Railroad—well that area is very largely appropriated; the Standard Oil comes in there for a lot of space.

Q. And the Linseed Oil Works?

A. Yes.

Q. And Nicholas Shepherd?

A. Yes, the Gas Company have two and a half blocks in there.

Q. What unappropriated tracts in that district do you know, Mr. Walker?

A. Well, I have not made any personal investigation of the record titles there, but in driving by, there are quite a number of vacant lots.

Q. Single lots?

A. Single lots, yes. I know a number of them belong to the different railroad companies.

Q. There are quite a number of lots that belong to the railroad companies?

2147 A. Yes. While vacant they are still appropriated. That particular tract is not very considerable; I suppose there would be an estimate of seventy-five per cent.

Q. What there is not occupied is held in single lots?

A. I have not investigated the titles; there are contiguous lots. I notice in driving through there two lots without buildings on them; I could not state definitely from this plat without checking it up.

Q. I show you a map, Exhibit 38, and ask you if you recognize and know it—for your own information, I understand it is a photograph of a map not completed to date, but showing the location of the different enterprises within the area shown on the map. Here is the Prouty-Bowler Soap Company; on the corner of Court and First Street is the Des Moines Boiler Works, and further up on Walnut Street the Eagle Iron Works; the Gas Works are shown on First Street between Vine and Market?

A. I recognize this is a map of that section of the city. I am

able to identify some of those buildings; I can not locate all of them.

Q. I want to ask you whether you could identify and point out on the map the different buildings. You may examine the map and note the buildings and then answer whether it is not true that within the district chown upon the plat or map, Exhibit 38, the ground is not practically occupied either by railroads for railway purposes or by various manufacturing and storage enterprises?

A. This map indicates that this territory is largely appropriated by buildings, but as to the extent and also the car lines I am not able to identify all of the buildings; a number of them I am, but others I am not.

2148 Q. Now that district is rather favorably located and situated for inside manufacturing, storage and warehouse property, isn't it?

A. It is.

Q. It is well served by railways?

A. It is.

Q. Is there any district in East Des Moines as close in that affords anything near like the same facilities for such uses?

A. Nothing as close in.

Q. In fact that is about all there is over on the east side of that character?

A. No, that is a different proposition; it is the nearest, but adjoining that and going out it extends——

Q. You will note my question precluded going outside.

A. If you don't go outside of this, that is all there is of it.

Q. Not to go beyond that distance from the post office, if you please.

A. No, you have got to go farther than this. I do not want to appear to state that this is the only property available there.

Q. Of course there is outside property; but there has been a growing demand for inside properties for warehouse, manufacturing and storage purposes for the last few years?

A. There has been for warehouse and storage, unfortunately more than for manufacturing.

Q. But there is a growing demand, isn't there, for such use?

A. Well, we can't notice it grow as fast as we would like to see it.

Q. You belong to the Booster Club?

A. I am simply a private subscriber; I help pay the freight, Mr. Read.

Q. You couldn't find as much as two blocks of contiguous property in that district or in the West Des Moines district, aside from Hubbell's trackage property, that is on the market for sale,

2149 could you?

A. Well, I imagine, Mr. Read, if you were to go south of the Q tracks as this land here is in Block 9 and 10 in M you could buy up all that country through there.

Q. That is below water level though?

A. Well, there is no great different between the elevation of one side of the track or the other.

Q. You will notice the map, Exhibit 5, and see some of the elevations. It goes down to 19 in Block A and south of Block A in Coon point, it is much lower?

A. I don't know what elevation that 19 and 23 is taken of, but the general surface south of the Q track is practically the same.

Q. At any rate, the height given is very much less than it is in Block B or C, isn't it?

A. Yes, this — shown 23 and 71.

Q. Then, Mr. Walker, there are no railway tracks over in that territory either?

A. Well, there is a track there.

Q. The Q is the south track?

A. Yes.

Q. So that is not served with trackage over in that district?

A. My understanding is they have a uniform transfer service and if yon are one one road you get the benefit of the local shipment of all of them.

Q. When you go south of the Q. there are no tracks between that and the river?

A. No, the Q is the south track in this portion. When you go further east towards the Packing House then other lines cross it.

Q. What is the range of prices on Court Avenue from First east to Fourth street per front foot?

A. On East Court Avenue?

2150 Q. Yes.

A. I haven't any information of any sales there for a long time.

Q. Do you have to have sales?

A. That is one of the surest ways of determining values, Mr. Read.

Q. Doesn't that depend on whether the sale is a normal one or not?

A. Oh, yes; when a man buys anything for use in the ordinary course of business I would assume that was a fair price.

Q. That is a series of sales?

A. Yes, not a single sale.

Q. One sale wouldn't make a market?

A. No, because there might be many things surrounding that particular sale.

Q. Do you know what the range of prices is on East Walnut Street from the river east to Fourth?

A. Well, I have known a sale there at $75 a front foot, a purchase made there two or three years ago.

Q. Where was that?

A. A purchase made by J. C. Hume at the southeast corner of Third and Walnut.

Q. What is the holding price now, $500?

A. I don't know.

Q. I ask you if you know the prices and values on Walnut east from the river to Fourth Street and you have given one sale.

A. I would say $100 a foot. The Stewart Estate have a frontage of 88 feet and we have figured $100 as being a fair price.

Q. On Locust?

A. On Walnut Street.

Q. Is that on Walnut Street?

A. Yes, west of the Northwestern station on the north side of the street.

2151 Q. How much frontage is there?

A. 88 feet.

Q. Right joining the track?

A. No, it is retail property. You are asking about Walnut street. It is immediately west of the passenger station on the north side of Walnut and it is retail property.

Q. When you inspected the Gas Company property did anyone go with you?

A. Yes, sir.

Q. Who was it?

A. Mr. Frank Mathis, W. H. Arnold, Mr. A. S. Wilcoxen and I think Mr. Hauge and myself—that makes five.

Q. Did you discuss the matter and arrive at a valuation over there while you were together?

A. We discussed the property, yes, but made no agreement——

Q. There is considerable similarity between your valuations?

A. I said we discussed the property but made no agreement as to valuations.

Q. I didn't ask you that—referring again to that 88 feet of the Stewart Estate on Walnut Street, that is held for how much now?

A. We have held the property at $100 a foot.

Q. I think I was informed you were holding it at $10,000? That is a mistake?

A. Why, yes. We haven't offered the property but that is our estimate of its value.

Q. There was some 22 feet of a tract belonging to the Stewart Estate you refer to?

A. No; I spoke of a 30 foot tract on Grand Avenue; and 40 feet on Grand Avenue, in reply to an earlier question; but on Walnut Street the only property the Stewart Estate now holds is 88 feet.

Q. Suppose that you were to receive a commission to buy

2152 two blocks of trackage property in West Des Moines east of Twelfth street and south of Mulberry and north of the Hubbell ground, what price do you suppose you would have to pay for it, two blocks contiguous, some place along the Sheuerman property there?

A. That would be a difficult matter. I doubt whether that amount of property could be found that was not owned by the railroad companies.

Q. Well, assuming that it could be outside of the railroad property?

A. Well, I suppose on the basis of sales and values on that west

side property—out to Twelfth—I don't remember the property south there, west of Ninth.

Q. Don't get down into the flood district.

A. You were giving me the property that did not belong to Hubbell. I was selecting the nothwest corner as being the cheapest in price.

Q. You might just as well take in two blocks and a half or two and three quarters?

A. When you go north of Cherry street you have got into property that has value more than simply for factory purposes.

Q. It is inside factory property?

A. Yes.

Q. What would two blocks and a half in there cost today?

A. Oh, I suppose on a basis of, oh probably $300 to $350 a front foot.

Q. A block is how many feet square?

A. 264.

Q. Let us get that down to dollars if we can?

A. What is the frontage now?

Q. Two blocks and a half contiguously situated?

A. On a frontage of 660 feet, $300 a foot would be
2153 $198,000.

Q. A frontage of 660 feet how much?

A. Would be $198,000.

Q. Isn't it more than that?

A. Didn't I understand that to be your question?

Q. What would it cost at present values to reduce to one ownership two blocks and a half of the ground in the district referred to, using the Sheuerman property as a nucleus?

Objected to on part of defendants as irrelevant, immaterial and not cross examination, and because it relates to a place remote from the property in question.

Q. You said about three hundred and how much a foot?

A. I said taking such property as the Sheuerman property, in that neighborhood, I said from $300 to $350 per front foot.

Q. That is, you mean take it in one block, there would be a frontage on two streets, that is right, isn't it?

A. Yes.

Q. Passing that now, Mr. Walker, the Kraetzer Carriage company property is situated in what block?

A. That is on Front street between Court Avenue and Vine—no between Vine and the street south of Vine; between Vine and Market.

Q. Using the Kraetzer Carriage Company property as a nucleus, what would it cost to get together there under one ownership two blocks and a half, assuming that it is not appropriated to railroad use and that it could be purchased?

A. I think on that basis $250,000.

Q. How much per front foot do you count on the average?

A. Well that would average probably from $150 to $200 per front foot.

Q. Now, Mr. Walker, over on the east side, having in mind the general situation between Court on the north and Market
2154 on the south, and Fifth on the east and the various uses to which the property is devoted, what would it cost now to obtain two blocks and a half trackage property, all served by tracks beginning and using the Des Moines Boiler Works property in Block D as the nucleus?

A. You mean taking and assuming the property was vacant?

Q. Exclusive of the buildings—assume of you please the buildings would have to be paid for in addition to what they are worth and assuming the properties are owned and occupied as they now are?

A. Running from Court Avenue south?

Q. Yes, south, or from Front street east on Court Avenue, beginning with Block D and get two blocks and a half.

A. I should say $125 a front foot.

Q. Do you call that the value of the property of the Des Moines Boiler Works?

A. Yes, sir.

Q. The Eagle Iron Works, east of that?

A. Yes, when you get back from Court Avenue south I should taper it down.

Q. Why would you do that?

A. Because Court Avenue is a thoroughfare, through street, and adds value to the property by reason of its location and accessibility to outside trade; it is more showy a place in other words.

Q. Toss your eyes on Exhibit 5 and find Block T?

A. Yes.

Q. That is a showy place?

A. Yes, it is showy.

Q. If one had a manufacturing plant on that it would be a good advertiser?

A. It would.

Q. Were there any peculiar circumstances you took into
2155 account in placing the valuation of $4,000 on that?

A. The fact of the narrow size of it between the street.

Q. Did you allow the old river front problem to enter into that estimate?

A. No, I simply figured on what was there; but I didn't figure on the difficulty of getting a foundation on the outer edge of that cinder pile.

Q. What assumption did you make with reference to the size of the lots?

A. I assumed it to be the size at the top of the bank as now graded.

Q. What is that?

A. My impression is it was about fifty feet; it was a month ago I made the examination.

Q. Mr. Walker, the map by scaling it shows the depth of the lot to be 84 feet; you didn't take that depth?

A. I stepped the distance across there and my impression was it was not as much as 84 feet.

Q. Your impression is it was about 50?
A. About 60 feet.
Q. So you assumed a narrow lot?
A. Yes.
Q. Did you consider them dissassociated from other property of the Gas Company, as separate property?
A. As separate property.
Q. Of course, they would have an added value, wouldn't they, if they were owned by the same parties that own Block B and associated with that property?
A. Well, if the street divides them, I don't see how that adds, that particular tract, especially, I could see no occupancy, save where their pumps were to clean out the pipes.

Q. That is to say, you attribute no utility to Block T by
2156 reason of its use in connection with the other property of the Gas Company, or by reason of its use in the gas business?

A. No, I did not. I simply took that as a piece of ground by itself.
Q. You asked yourself what somebody would pay for it?
A. Yes, what would this be worth to use as a manufacturing proposition.
Q. Disassociated from other property, as a separate piece of property?
A. Yes, a separate piece of property.
Q. Now, Mr. Walker the use for which a property is or may be available is a factor making for value, isn't it?
A. It is.
Q. So far as you know Block T may have a use in connection with the other property of the Gas Company in the operation of a gas plant, that is true, isn't it?
A. It might, yes.
Q. You gave no consideration whatever to that aspect of the question I mean its possible uses in connection with the gas business?
A. No, in placing my value on Block T I did not consider it an integral part in the operation of the gas plant; I could see the pumps were there.
Q. Well, now, Mr. Walker, assuming, if you please, that the two blocks, or assuming rather that the quantity of ground the Gas Company has is reasonably and fairly required in the conduct of the gas business, and assuming no less, substantially than the Company now owns would be sufficient, and assuming that the property is in its characteristics, so far as soil is concerned, adapted for that business, and assuming that there is a demand for the location for the site for a gas manufacturing and distributing plant, wouldn't

that tract of land located as it is centrally, accessible as it is,
2157 in your judgment command a much greater price than the valuation you have placed upon it for such a use?

A. Well, not being a gas expert, I cannot answer that, save in this way, if a concern needed more ground—
Q. You don't need to be a gas expert, you only need to be a real

estate expert. I require by the question you to assume the adaptability of the ground for use for that purpose, then I ask you whether the tract of ground of two and three-fourth- blocks substantially would not command a much greater price than the valuation you placed upon it for such a use?

A. Well, it would command a greater, but how much greater I am not able to say.

Q. Wouldn't it command substantially as much as the ground, and equal quantity of ground, just north and in block D and in Block I?

A. Well, if one piece of ground would be as valuable to them as the other, both serving the same purpose, the values would be the same.

Q. The other two blocks you had about $225,000 or $250,000?

A. No. That was on the west side of the river. What I endeavored to state the valuation on Court Avenue I put at $125 a front foot and then tapering down south on Court Avenue.

Q. On the frontage on Vine you would put it what?

A. Block D, as I did here, substantially $100 a foot. The only answer I could make to that question was requiring all of that ground for one purpose, would add to its value; to what extent, I wouldn't state.

Q. How much you wouldn't want to say?

A. How much I wouldn't want to say.

2158 Q. What I am trying to get before your mind, Mr. Walker, is the question of the value of this property of the Des Moines Gas Company for the uses to which it is devoted, or to a similar use requiring so much ground as that similarly located?

A. Well, it would only—all I could do, Mr. Read, would be in my judgment make an estimate; in other words, on the theory I was going to buy the ground I would have to pay extra prices for some — it there; some men would hold one up; on that basis on that sort of a basis I should say an increase of ten or fifteen per cent would cover the fair going prices on the whole tract.

Q. Just precisely what do you mean when you say that in your opinion the gas property is worth $97,500?

A. I mean, taking these special and separate descriptions as I testified to their value and selling them for factory or warehouses or similar plants, that would want 132 feet frontage, taking 132 feet as the unit.

Q. Suppose you take the property or you have a customer who wants all that ground, two blocks and three quarters substantially, that would command a greater price than if you were dealing in smaller units, single lots or two lots?

A. It would if you know a man had to have that amount of ground.

Q. Suppose there was a customer in the market for that much ground in that locality?

A. Of course, if the owners of the lots in that locality knew that fact it would appreciate it.

Q. Suppose you owned that ground and the Gas Company would come to you to buy it for the purpose of devoting it to the business it is now devoted to, your estimation of the value of the property would be greatly in excess of what you made it now?

A. I suppose I am human, along with the rest of you. That undeveloped ground if a man wanted to buy a tract of it. I
2159 would sell it for less money than I would peddle it out lot by lot; on the other hand if the land belonged to a number of owners, a tract of that size, you would have to pay a little more than lot prices in some cases. Answering your question to the best of my ability all I could do would be to make the estimate of an increase I should say ten or fifteen per cent.

Mr. BRENNAN: That is to take care of this element of human nature?

A. Yes.

Q. To reproduce this property, that is to say, obtain a tract of equal size in the manufacturing district on the west side of the river, according to your figures, would cost something like $500,000 or $600,000 of the Sheuerman corner?

A. No.

Q. $425,000 to $600,000?

A. I think I said from $300 to $350 a front foot for the highest.

Q. To reproduce it in the neighborhood of the Kraetzer Carriage Company property would cost $250,000?

A. Yes.

Q. To go just across the river and reproduce it there you have given the figure of $97,500?

A. Yes, but when you cross the river you cross the dead line of real estate values.

Q. That has been more so in the past than it is just now?

A. I have not seen the advance on the east side property. We have been in the market as sellers of east side property.

Q. Not such property as that?

A. Generally the advance has been with the west side property, on all the properties, it has been on the fringe to the west.

Q. Precisely what is the basis of your valuation of the Gas
2160 property; on what do you base it, speaking accurately now and precisely?

A. Well, I base it, having the two items as one of the things; I form my basis on two sales, the sale of Jown Rowett to Ben Younker and the sale of George Wright to Mr. Haines; and the general familiarity with property off to the east and south on the river there, and the general value of real estate on the east side, value on the business streets.

Q. What assumptions have you made now with respect to the general values of real estate?

A. I don't wuite understand that.

Q. You say you base your judgment upon two sales, the Rowett sale and the George Wright sale, and upon your general knowledge of east side values?

A. For instance, Walnut street property is selling at $75; and

Grand Avenue property not being able to sell at $100 and the fact that there has not been the growth of population in the town that we anticipated and hoped for.

Q. Why do you recur to the Walnut street sale of $75; that is not the asking price now by any means?

A. No; Hume has built a building on there; that property was for sale a long time before it went for $75.

Q. Don't you know properties that sold on Walnut Street for as high as $300 since?

A. I don't know of those sales; but what are the improvements?

Q. Without improvements?

A. A specific sale of $300 a front foot, I don't know of such.

Q. Do you refer to the sale of $75 a foot some years ago?

A. Yes.

Q. During the panic?

A. No, it wasn't in the panic.

2161 Q. It was an exceptional sale, wasn't it?

A. It was not so considered; I was trying to sell him some property at $100 and he took this at $75.

Q. You was trying to sell on Grand Avenue at $100?

A. Yes, sir.

Q. What is the asking price now?

A. I don't know.

Q. Mr. Hume bought it for speculation?

A. Or investment, whatever you may term it. He has since built a building on it.

Q. Do you know just when that sale was made?

A. I don't recall now, but I should say within about three years. I could look up the record and determine it.

Q. Who was the seller?

A. I don't remember.

Q. A resident or a non-resident?

A. I don't know as to that; I simply know Hume bought a piece of property on Walnut Street.

Q. That is the only sale you have in memory and that is the one you used as a factor in making up your mind as to the value of the gas property?

A. One of the factors.

Q. You spoke about the Rowett sale?

A. Yes.

Q. What property was that?

A. Lots 3 and 4 in Block K.

Q. When was that sold?

A. I don't recall that date; I should say within five years.

Q. Nearly five years ago?

A. I should think so.

2162 Q. And the price of that?

A. $7,000.

Q. For the two lots?

A. Two lots 132 feet square.

Q. The other sale was the George Wright sale; what was that?

A. That was lots 9 and 10 in Block M.

Q. Now, Mr. Wilcoxen was present when you were inspecting the property.

A. Yes, sir.

Q. Did he give you the same figure he gave to Mr. Hauge with reference to the lot over here on the market?

A. We drove over in a machine and he pointed out some ground and said the man asks $7,000 for it. I didn't question him about it; we had fixed—we started over that way.

Q. Did he give you the figures of the Rowett sale?

A. No, I found that from the record. Mr. Wilcoxen spoke of some piece of property that he had for sale for $7,000.

Q. Then upon that assumption east Des Moines property was the dregs of Des Moines?

A. I didn't make it as strong as that.

Q. It was the yellow god anyhow?

A. You can define it.

Q. You put that valuation on it that you wished?

A. No, as I stated, Mr. Read, that the purchase of this Rowett property was $7,000.

Q. Five years ago?

A. Now, since that question is brought up, I would like the privilege of referring to the record and give the dates, of this Lot 9 and 10 in M being sold at $4,500.

Mr. READ: You may do so.

At this time an adjournment was taken until 1:30 P. M.

2163 1:30 P. M., MONDAY, *August* 14, 1911.

B. S. WALKER being continued on cross examination by W. L. Read, Esq., testified as follows:

Q. You have got the dates of those two sales you referred to?

A. I have, yes.

Q. You may give them?

A. The sale of lots 9 and 10, Block M by George G. Wright to Jansen Haines was on October 16, 1905 and the sale of Lots 3 and 4, in Block K was by John Rowat to B. A. Younker on April 18, 1905.

Q. What is your present appraisement of these lots in Block K?

A. In Block K my valuation is $12,000.

Q. The Younker sale was how much?

A. Was $7,000. And the Wright sale my valuation was $6,000 and the sale was $4,500.

Q. Were there any unusual circumstances connected with either of these sales that you know of?

A. Not that I know of, no sir.

Q. Did you have any personal knowledge about them?

A. No information.

Q. Somebody told, you of them?

A. I looked them up on the record.

Q. Somebody in the first instance told you of these two sales?

A. No, after I looked this property over and before I came to a determination as to its value I looked up the record for sales in that immediate vicinity and found those two sales.

Q. I wish you would tirn your attention to Exhibit 5 and along on the north side of Court Avenue just north from the Des
2164 Moines Manufacturing and Supply Co., you observe it do you?

A. On the north side of Court Avenue.

Q. On the corner.

A. Yes, sir.

Q. There is 132 feet frontage on Court Avenue that was sold to or bought for the Bentley & Olmsted Manufacturing Co., a boot and shoe concern?

A. I saw a statement in the paper.

Q. Do you know at what price?

A. I do not.

Q. Did you take any pains or make any effort to find out?

A. No, I did not.

Q. For your information I will state, and you may accept it as *a* authoritative that that property was sold and purchased recently for $22,000. That is to say about $222 per front foot. Does that seem to you to be too much?

A. That would seem to me to be a very liberal price.

Q. Too much for your conservative estimate?

A. It might be.

Q. If that sale were made that would have something to do in modifying or changing your judgment wouldn't it as to the Des Moines Manufacturing & Supply Co. property?

A. Well I would consider the—of course the use for which it was bought, there is a manufacturing plant that wanted a central location.

Q. By the bye, that property on the north side of Court Avenue is not a trackage proposition there is it?

A. No, not trackage property.

Q. Could be worth less than property to the south, south of the street?

2165 A. It would for the ordinary manufacturing purpose only I was told by Mr. Olmsted that they didn't need trackage because they didn't have shipments in car lots. The ordinary factory that gets in material in great quantities of course must have trackage or a great deal of cartage.

Q. That may be a particular circumstance as far as that property was concerned, bur generally speaking trackage property in that district would be worth more than non-trackage property.

A. It would for the ordinary manufacturing purpose.

Q. To what extent of course would depend on the demand for it for that purpose?

A. Yes, sir.

Q. The Des Moines Manufacturing & Supply Company just across the street is trackage property?

A. It is.

Q. So is the gas company trackage property.

A. It is.

Q. The gas company property is only one block away?

A. Yes, one block. It is a long block or ordinary block and a half; it is only the distance between two streets.

Q. The south end of the Des Moines Gas Company's property is more than one block from the Des Moines Manufacturing & Supply Co.'s property?

A. Yes, the block between Court Avenue and Vine street is a half — wider than ordinary blocks.

Q. Do you care to modify your judgment as to the value of the Des Moines Manufacturing & Supply Co's ground, you placed it this forenoon as I recollect at $125 a front foot on Court avenue?

A. Yes, sir.

Q. Don't you think that is too low?

2166 A. I do not sir. It strikes me that was an exceptionally high sale, this other property strikes me as an exceptionally high price and I would not believe that other property would see for any such figure.

Q. Do you know what the holding prices of property on Court Avenue east of this property I have called attention to is?

A. I do not. I had a general talk with Mr. Patrick who owns the Dempster Manufacturing ground some time ago, but he is the only person I talked with.

Q. How long ago was that?

A. That was a year or two ago. I don't recollect the price he made, he said he was anxious to sell.

Q. You don't know the present holding prices of properties on east Walnut street do you from First to Fourth?

A. Well we have a piece of property that we would be glad to sell for $100 or $125 a foot. Aside from that I don't know.

Q. Aside from that you have no information?

A. No.

Q. Do you recall what is was the city paid for the new city hall site at the corner of First and Locust street?

A. My impression, I don't know, but my impression is about $70,000.

Q. $78,000, wasn't it?

A. I don't remember definitely.

Q. And that was ab-ut 100 feet frontage on Locust street and the same on Grand?

A. It is probably something not far from that, but I would rather figure that the other way, Second street frontage.

Q. About $390 a front foot wouldn't it be?

A. If it was a hundred each way it would be 200 feet and

2167 that would figure $390 for $78,000.

Q. That would be $390 per front foot for the frontage on Grand Avenue?

A. Yes, sir.

Q. The same for the frontage on Locust street?

A. Yes, sir, but if I may be permitted to say that property was especially valuable for that specific purpose.

Q. So the gas company property is for that specific purpose isn't it?

A. Well I don't know whether some other location might not be just as good for the gas company as the present one, it is a convenient location.

Q. Assume it would not be.

A. If that is the only place they could make gas of course it would be especially desirable one.

Q. Assuming it to be well adapted for the business, it is centrally located?

A. Yes, sir.

Q. Accessible from all points?

A. Yes, sir.

Q. Served by trackage well by more than one railroad. That would be worth more for that specific purpose just the same as the city hall lot would be for the city hall site?

A. Yes, if necessary for them to have a location well served by trackage, as to the advantage of that identical spot for a gas plant I am not prepared to say that it would have great advantages over any other one where it has the same amount of ground and trackage.

Q. In fact it is then worth more money than you have given in the start is it?

A. I gave my best judgment on its value for that purpose.

2168 Q. Yes, from your point of view. You say the city hall site was exceptionally valuable for that purpose?

A. Yes, I do.

Q. And you testify then the value of $390 a front foot, that was the Grand Avenue frontage and Locust?

A. Well I was not buying that property, they bought it and I assume the best price they could get.

Q. You think that was too high?

A. Frankly I do yes.

Q. How much too high do you think it was?

A. I would think $50,000 would have been a very good round price for that property, but I was not consulted when it was bought.

Q. I am just inquiring because I imagined you being conservative thought that possibly too high?

A. Yes, I do.

Q. On west Locust street you said property graded down to about $400 a front foot next to the river is that right?

A. I was under the impression I said five. Call it five.

Q. Go across the river what is it worth immediately on the other side of the river?

A. On the east side?

Q. Yes.

A. Oh I would place the highest value on vacant property there at $150 on Locust street.

Q. Where do you find that property.

A. Well I should find it any place between the river and 4th street.

Q. What would be the highest, you said vacant property?

A. I would consider the most valuable property that on the river front which would be across from the city hall what would be the northeast corner of Locust and Front.

2169 Q. What would you call that worth?

A. Well the 132 feet square, I should think $250 possibly a front foot would be a very high price for that would be top proce for that 132 feet front on the river and on Front street and Locust street.

Q. Were you on the condemnation board that appraised that?

A. I was not.

Q. Were you a witness in court?

A. I was not. I was not aware there had been condemnation on that 132 feet.

Q. You are speaking of the property known as the Snook property?

A. It belongs to Hubbell. I was endeavoring to testify about the property across on the east side of Fr*no*t street and the south side of Locust, the east side of Front.

Q. The old Bottling works?

A. No, the bottling works was on the west side of Front street; ran down to the river.

Q. I am talking about property on the west side of First Street that was condemned and is now part of the parkage over there. What would you call that worth. There on Locust street?

A. Well I should think $250 a foot was a good price for it.

Q. Do you know where the Shaver Carriage Co. property is, the corner of Third and Locust?

A. Yes, sir.

Q. What is that worth on frontage?

A. I would say $150 a front foot.

Q. Do you know what the holding price of properties along there is?

A. I do not.

Q. What do you *gua*ge prices by?

2170 A. Well on the rental that you derive, and on the property of the Stewart estate as on Walnut and Grand Avenue.

Q. You are capitalizing the income, are you?

A. Yes*m* that is about it.

Q. And that without regard to the holding or asking price?

A. Yes, sir.

Q. And without regard to the price you could buy such properties for?

A. Well properties in there have been—I have heard statements that property was sold there for $200.

Q. You thought it was too high didn't you?

A. I thought that was a good fair price for it.

Q. Butler property about $150 a front foot?

A. Yes, sir.

Q. Frontage on Locust street?

A. Yes, sir.

Q. Do you know where the Bolton property is?

A. Across the street some place.

Q. Do you know what the asking price of that is?
A. No.
Q. Don't know the holding prices of any properties along there?
A. I do not.
Q. All you do know is the Stewart estate has got some over on Grand north of that you would be goad to sell for so much?
A. Yes, a hundred dollars a foot.
Q. But you don't know the holding price of property on Locust street?
A. No, sir. I have seen that property on Locust street and Grand Avenue go down 50 per cent on the asking prices.
Q. And you have seen them a good deal cheaper than they
2171 are now too haven't you?
A. Of course these people—there have been a number of sales on Grand Avenue I have not investigated.
Q. The truth of the matter is, you don't regard east side property, Locust, Walnut, Court Avenue or Vine street down there of much value relatively?
A. Relatively I do not, no sir.
Q. You regard it as cheap stuff?
A. I do as compared to west side property.
Q. Do you know a tract of thirty three feet on the northeast corner of east First and Locust streets, of about 132 feet deep?
A. I know that location, yes, sir.
Q. Do you know what that is held at?
A. I do not.
Q. Did you inquire?
A. I did not, no.
Q. Do you know who owns it?
A. I do not.
Q. Did you ever hear it was held at $15,000 or practically $500 a front foot?
A. I never heard that, no sir.
Q. Of course you would think that too high too?
A. I would think that too high.
Q. There is 22 feet on Locust street just west of the Northwestern track owned by J. H. Phillips, Harry Phillips, do you know what that is held at?
A. I do not.
Q. Do you know whether it is held at $8,000 or not?
A. I do not. Harry is amply able to hold it at most any price.
I base my valuation on what property would produce with a
2172 reasonable anticipation of increase.
Q. You take the income that can be produced from the property and after paying taxes and expense of keeping you capitalize the income?
A. Yes, and if it is situated where the growth of the city is toward it I would add something in anticipation, speculation.
Q. Capitalize at 5 per cent or six per cent?
A. I would capitalize it on six per cent.
Q. So in figuring the Des Moines Gas Company property you necessarily assume some income that could be produced from that?

A. Oh surely.

Q. What did you assume, what income?

A. Well I hardly—well I figured that—I probably a little anticipated myself. Speaking of the gas company and considering their use of it in the gas company's use of it, I did not figure a specific rate of interest or income that they would get on that property. I simply figured the value of that property as any person would buy it to use for an ordinary commercial use.

Q. You have given us aggregate values on the company's property of $97,500?

A. Yes, sir.

Q. What rental do you figure would be produced from that as a basis for your valuation?

A. I did not make any single estimate of that particular property But I was trying to state in figuring the question of value *on* I would figure a specific piece of property as to what it was worth as to the rent that might be obtained from it, that would be my basis of value.

Q. Take lots 9 and 10 in Block M, you have given us a valuation of $6,000?

2173 A. Yes, sir.

Q. Now what income did you figure that that property would produce?

A. It would be very hard to figure any income from that property.

Q. Did you figure any income from that?

A. I figured no income from that. That property along there I would figure would simply be held--that its value would be anticipatory, if a factory came along and wanted a piece of ground they could pay that amount of money for it, you would have to get an income in the increased price above what you bought it at.

Q. You figured no income then for lots 9 and 10?

A. No.

Q. It is in use now?

A. Yes, sir.

Q. You allowed nothing for that use?

A. I figured it was in use, both used as part of the plant and adjoining ground lying along side of it, in other words take that piece of ground and detach that building and there would be no important income. I assumed no income from it putting that value of $6000 on it.

Q. Lots 9 and 10, Block B did you as-ume any income there?

A. No more than the general use of the property by the gas company.

Q. What did you assume the general use was worth by the gas company?

A. Well about the only way to answer that would be to say the interest on the valuation that I placed on it.

Q. That is going around in a circle, that don't get any place.

A. In none of that property, none of these values did I figure this company gets a certain per cent from this property.

Q. Did you assume this on the income that could be
2174 obtained from that property by the owner. Did you do that?

A. Simply in this way. In figuring these values I figured if there was a use for it for actual manufacturing purposes or for actual occupancy that use would be worth a given rate of interest at six per cent on the valuations I made. In other words *in other words* there was a valuation of $6000 I would figure worth $480 use to the plant.

Q. I understood you, you capitalized the income to obtain value.

A. As the general valuation to determine the values.

Q. You don't get any place assuming a valuation and then saying the rent is worth the interest on that much capitalization do you?

A. Well I figure a value that when the property is used when there is somebody to use it and they put it into use that it must pay an income on what the property is worth.

Q. How do you fix values then by that?

A. Well I would figure a manufacturing plant could afford to pay so much for its ground based on general sales in that neighborhood if the price was too high for them they would have to go to some cheaper neighborhood. Where a piece of ground is vacant like this stuff along the track, a man who buys that for speculative purposes expecting to hold it until somebody comes along he can't use it, in other words he must get unearned increment as his profit.

Q. Here is the gas company the property all in use. What is the calue of the use?

Objected to as not proper cross-examination and incompetent.

Q. In that same connection how much rental would a person have to pay to obtain the use of all of that ground?

Objected to for the further reason that the witness has already explained three different times the manner in which he
2175 arrived at his valuation in real estate.

A. In determining my values I figured that the use of the gas company would be the same as the use of any other occupant of these lots, I did not figure there was a specific value in their use by the gas company about other use by a factory or warehouse or any other manufacturing purpose.

Q. What would be the rental value then for any purpose, any use to which the property is adapted?

Same objection.

A. Well six per cent of the real estate values would be a fair rental in my mind.

Q. Now then what are the real estate values?

A. Well $97,500 in my judgment on this property.

Q. A moment ago I started out by asking you a question and you said you determined values by capitalizing the income or rental.

A. Yes, sir.

Q. Now I find that you assume a value first and then figure the income from that, am I right about that?

A. Well hardly. It is probably like little Lord Fauntleroy in Mrs.

Hodgson's book he said he was a very poor "'splainer" and that may be my difficulty Mr. Read. I have tried to state this, if you will permit me that the question of the value of a piece of property, the thing that would occur to me would be what can that be used for and what price can be paid for its use and if it is property for which there is immediate demand it is comparatively an easy thing to determine that value. If it is outlying property that the demand is uncertain, that there is no ready market for it, has to lay there until some concern comes along and wants it the man who buys that property must pay the anticipatory value on it, the
2176 speculative value covering the period held while not productive.

Q. You had the problem presented to you of placing a value on the gas company property?

A. I did.

Q. Precisely how did you do it?

A. I looked the property over and I looked up sales of these particular pieces, I knew of the sales of the property on Walnut street and Locust and the prices we were asking for our property and on that basis I came to this conclusion.

Q. Isn't it a fact Mr. Walker that properties, quarter blocks on Mulberry street at 10th and Mulberry along through there and this side of there five years ago would not and did not sell for more than $10,000 a quarter block?

A. Yes, that is true.

Q. It is true now is it not they are selling for as high as $20,000 a quarter block, held for that?

A. I know they are held at very high prices, I know a friend of mine who has bought one said he would like to know what to do with it.

Q. Well he better sell it again at advanced prices.

A. He is the fellow that paid the advanced price.

Q. Do you know a property on the corner of east First and Walnut street that was condemned about a year ago by the city for park purposes belonging to Dr. Patterson?

A. Yes, sir.

Q. Do you know the price?

A. I don't remember the price. I saw the condemnation and looked ot over.

Q. Let's see if I can't refresh your recollection. That was forty feet frontage on First street and 47 on Walnut, do you
2177 recollect the price?

A. I do not. There was a bunch of those, I read it over at the time and paid no special attention afterwards.

Q. Don't you recollect the price of the Patterson property was $8500 or $8,250?

A. I don't recollect these different prices, there was quite a number of condemnations in there and I don't recollect the irems of each condemnation.

Redirect examination by R. O. BRENNAN, Esq.

Q. You have been identified with some of the institutions here in the city, that is Commercial Exchange?

A. Yes, sir.

Q. You were formerly president of that organization?

A. President of the Commercial Club, yes.

Q. You are also a member of the Greater Des Moines Committee?

A. No, I am not. As I said I simply helped pay the freight.

Q. Have you laid out additions to the city of Des Moines?

A. I have, yes.

Q. How extensively have you been engaged in the real estate business in that connection?

A. With the Vermont Syndicate that laid out Kingman Place a matter of twenty five years ago I was one of the inforporators and the first secretary of that. That is the country that is bounded by 28th and 30th and Kingman Boulevard and old North street, now University Avenue. Then I have been identified with Clifton Heigh- company for 20 years past.

Q. So you have been actively engaged in the real estate business in the city practically all of your residence in the city?

2178 A. Yes, sir. Then as I stated I was one of the trustees of the Joseph B. Stewart estate.

Q. How extensive were the holdings of the Joseph B. Stewart estate?

A. They had probably $250,000 worth of real estate.

Q. Some of it down town property.

A. Yes, some of it.

Q. Now Mr. Read persisted in saying that this property that you refer to on east Walnut street was up against the railroad. I don't know whether that detracted from its value or not, and I would like to have you tell the master just where the property is located?

A. It lies west of the alley that is west of the Northwestern Station on Fourth and Walnut.

Q. Now another thing, Counsel asked you about the value of the use of this property to the Des Moines Gas Company and of course you keep in mind that in connection with the use is the use of all the streets and highways which they use for their distribution system do you not?

A. That would count, yes.

Q. So that it would be as you say hard for the purpose of determining just what rate of return was accrued from the real estate itself.

A. I don't want to be understood to testify as to what rate should be paid on the company's investment. My statement of percentage was intended as indicating a general factor to determine values of real estate.

Q. You were also placed in a position by counsel in that you were required to assume that in case parties were organizing a gas company that there was no other site in the city which they could pur-

chase. Now I would like to have you tell the Master in a
2179 general way just what factory sites are available contiguous to railroads either in South Des Moines, East Des Moines, West Des Moines or North Des Moines?

A. Well it is practically without limit taking railroads with the cross roads and the outside territory after you get out a mile and a half or two miles all that northeast country that Mr. Hauge testified about, then the Highland Park country crossing over the Belt Line and all of the southeast bottom and all of the south side, there is hardly any limit. We have 54 square miles in the city and I suppose there is occupied possibly fifteen square miles and the rest of that is available for factory sites and the tracks, it is possible to run spurs from the tracks and cover the outlying country immediately continguous to the close settlements.

Q. The Rock Island, the Keokuk division, the Wabash, Burlington, Des Moines and St. Paul all enter the city from the east.

A. Yes, sir.

Q. And their tracks parallel each other?

A. As they enter, yes.

Q. The Northwestern Railroad runs in a northeasterly direction from its station?

A. It does, yes.

Q. Then after it gets east to 14th street it runs——

A. Practically north.

Q. And the Chicago Western after it leaves east 20th street in what direction does it run?

A. That runs practically north parallel to this so called short line.

Q. And the so-called short line is the Des Moines & St. Paul.

A. Yes, sir.

Q. Now controlled by the Rock Island?

2180 A. Yes, sir.

Q. So that all the railroads that reach West Des Moines come by way of the east side of the river except the Milwaukee road?

A. Except the Milwaukee road, yes.

Q. The Northwestern does not enter the Union station or any other station in west Des Moines?

A. No.

Q. Now it is a fact is it not Mr. Walker in the city of Des Moines that for instance you may find at Sixth and Walnut streets property that is worth from $2,000 to $3,000 a front foot yet you may go two blocks from that particular point and find property way below that?

A. That is true.

Mr. READ: I suggest that — easily open to the objection leading and suggestive.

Q. The retail section of the city of Des Moines, the principal retail section in West Des Moines is bounded by what streets?

A. It is bounded on the south by Walnut, the southside of Walnut on the north side by Locust and on the east by Fourth and on the west by Ninth. That covers the heart of it.

Q. The heart of the retail section of the city of Des Moines?

A. Yes, sir.

Q. Now as you radiate from that center in any direction what is the fact as to the general range of prices?

A. The prices are very much less and especially as you go to the east or to the south of it. As you go north the growth of the city being north and west the values have increased in these directions more than elsewhere, that is asking prices have.

Q. Counsel tried to have you say in east Des Moines,
2181 that is you sort of threw cold water on east Des Moines. You don't mean you have any particular aversion to east Des Moines or anything of that sort?

A. Not at all sir. I was trying to state what my experience had been, the difference between east and west Des Moines real estate. I was trying to state facts as I saw them without any malice towards east Des Moines.

Q. Simply looking at conditions as they appear with regard to real estate?

A. Yes, sir.

Q. You were asked about property along Front street in East Des Moines. You were asked about the old Butler property which is now under investigation in district court under condemnation proceedings. Do you know the property immediately south of that where Mr. McGrew used to live between those two blocks?

A. I knew McGrew had a piece of property there.

Q. Do you know at what price it was sold to the city?

A. I don't know. I know that the city bought one or two pieces in *in* and condemned the others, I saw the result of the condemnation or award but didn't follow it up, I read it as published in the papers.

Q. Your attention was called to that by reason of property at 1st and Walnut street, I believe some reference was made to the Paterson property and the price $8,250. Do you know just what claim was made when the matter was under investigation in the district court on an appeal from the sheriff's jury?

A. All that I saw the newspaper statements that he claimed to the river line, that he was claiming greater depth than the city conceded.

Q. You don't know whether he got that or not?

2182 A. I don't know sir.

Q. He was claiming some $15,000 or $20,000 did you know that?

—. I didn't know that. I remember the Taylor case, I paid more attention to that than the condemnation. The Taylor case decided the river line did not include artificial filling and my understanding was that Patterson claimed to the river line not including part of this that was platted.

Q. His claim in that case was based upon the Walnut street frontage?

A. I would naturally suppose so.

Q. Rather than the Front street?

A. Yes, sir.

Q. Now the city hall site, he asked you about that?
A. Yes, sir.
Q. And your remembrance is that they paid $87,000?
A. $70,000 was my impression, Mr. Read stated $78,000. No doubt he is right?
Q. That is some distance from the gas works is it not?
A. Yes, four or five blocks I would say. It is between the third and fourth block.
Q. Well the gas works is south of the Rock Island railroad?
A. Yes, sir. Would be a block and a half as we figure blocks, it is a long block to Court and Walnut would be two and Locust would be three. It would be three and a half blocks as we measure blocks and the width of the street, that is from the south side of the Walnut track would be three and a half blocks and the width of the street to the south line of the city tract.
Q. Suppose you start the west side of the river at say Sixth and Locust and proceed three blocks south and is there any difference in the value of real property?
A. A vast difference.
2183 Q. About what percentage of difference?
A. Well that would take you there to south of Vine street on Sixth, of course there you get into some valuable trackage, but there is a difference there, the Sixth and Locust frontage would be worth six times, easily six times in my judgment as Sixth and Vine frontage on west Sixth.
Q. Now as you proceed south from east First and Locust street is the range of prices higher or lower?
A. It is lower.
Q. I believe you have said there are tracts of ground in south Des Moines which are available for manufacturing institutions.
A. There are.
Q. Any railroads in south Des Moines?
A. Yes, the Great Western is there.
Q. What advantages come to a manufacturer by reason of the Des Moines Union, the transfer privileges that obtain in Des Moines?
A. To answer personally I had or did have a lumber yard on the south side and it was convenient to have my cars of lumber set on the buggy works switch, as it was called, and the transfer charges were absorbed by the shipping road was my understanding so my understanding is the shipper on any of these lines get cars set to his track or his switch without any specific payment for it.
Q. I presume there are certain lines *if* business where it would be a great advantage to be close in and be near the business center.
A. Yes, there are.
Q. But where you are manufacturing a product which is delivered *to* under conduits, mains or pipes, all over the city there would not be that same necessity as where you had a business which requires it to be close in or in the business center.

2184 Mr. READ: I don't believe Mr. Walker is qualified to give an expert opinion on the gas business.

A. Storage houses would have to be close in but a concern that

people did not have to go to the plant could be farther away in my judgment.

Q. Without suffering any inconvenience?

A. Yes, sir.

Recross-examination by W. L. READ, Esq.:

Q. You of course don't know anything about what the cost of constructing underground pipe means?

A. Only laying water pipe, Mr. Read up to Clifton Heights where I could not get the water company to do it.

Q. That is just one pipe.

A. Well it has been several pipes, several times.

Q. You this forenoon said you made some distinction between outside and inside business property?

A. Yes, I did.

Q. You mean in each instance inside property is worth more money.

A. Yes, far more.

Q. Very great deal more?

A. Very great deal more.

Q. Your south side Clifton Land Company property is residences is it not?

A. Well largely, we have land adapted to factory purposes but of course it is chiefly residences.

Q. It is not a factory district to any considerable extent?

A. Not any considerable extent although we have factories over there.

2185 Q. This Stewart estate is on the east side is it?

A. The great bulk of it, but there are scattered properties.

Q. You since you have been engaged in the Clifton Heights land deal have not made any deals in other east Des Moines or west Des Moines business property or manufacturing properties have you?

A. Yes, I have sold on my own account property on——

Q. On the south side?

A. No, I am speaking of this at Second and Chestnut Street property I have been instrumental in disposing of *that* the last few years.

Q. But you have not been active in the general real estate business?

A. No.

Redirect examination by R. O. BRENNAN, Esq.:

Q. In your valuation of the real property of the Des Moines Gas Co., does the amount which you have stated $97,500 represent your independent judgment as to its valuation uninfluenced by any other valuation that has been placed upon the property by any other witness in this case?

A. I have arrived at it from my own conclusions.

Witness excused.

2186 W. H. ARNOLD being called on the part of the defendant and sworn and examined in chief by R. O. Brennan, Esq., testified as follows:

Q. Where is your place of residence?

A. 1032 west 20th street.

Q. City of Des Moines?

A. Yes, sir.

Q. How long have you resided in this city?

A. Came here in 1886, 25 years this fall.

Q. What has been your business during your residence in Des Moines?

A. Buying and selling property.

Q. All sides of the river?

A. Yes, sir. Mostly on the west.

Q. Have you handled any large estates for non residents during your experience as real estate agent in Des Moines?

A. I handled the Cranston estate and I handled estates for Mr. John Gibson a few years ago. That has been a number of years ago.

Q. Where is your office?

A. 201 and 03 Youngerman Block.

Q. And in the course of your business of buying and selling real estate have you become acquainted with the market value of real estate in Des Moines?

A. Yes, sufficient for my use and my clients at least.

Q. Does your business take you into the sale of business property as well as residence properties?

A. Yes, sir.

Q. You have handles a good many business properties in Des Moines?

A. Some, not as many as some, but some.

2187 Q. Have you made an inspection of the real estate of the Des Moines Gas Company?

A. Yes, sir.

Q. I wish you would tell the Master if you knew what the reasonable market value of that property was, say, about January 1, 1911.

A. As a whole?

Q. The questions first whether you know?

A. Yes, I think I know.

Q. I call your attention to the plat before you or blue print which is marked Exhibit 5 in this case, and call your attention first to Lots 9 and 10 in Block M of Scott & Dean's Addition and please state to the court what in your judgment was the reasonable market value of these lots at the time to which I have called your attention?

A. I placed these at $50 a front foot, $6,600.

Q. Now referring to lots 9 and 10 in Block B shown upon the plat Exhibit 5, please state to the Master what in your judgment was the reasonable market value of those lots on January 1, 1911?

A. $55 a front foot for the frontage, 132 feet, $7,160.

Q. Referring to lots 3, 4, 5, 6, 7 and 8, in Block B shown upon the plat Exhibit 5, please state to the Master what in your judgment as the reasonable market value of these lots on or about January 1, 1911?

A. I took the values, the railroad values here, 264 feet and I put that at $70. That is that would take in 4, 5, 6, 7 and 8, that would be $18,480. And then I took 3, as about 44 feet and it is too long to back there for it for trackage, I valued that at $40 a front foot making $1,760 for that 44 feet.

Q. Just what 44 feet are you referring to?

A. Well 44 feet if you take as that plat shows it would be the north 44 feet of Lot 3. This is 1, 2, 3, 4, 5, and 6 and there
2188 is more lots on this side than that. In the east there are four lots and on the west six.

Q. I was asking you about the six lots in block "B", 3, 4, 5, 6, 7, and 8?

A. That would *ne* $20,240.

Q. Referring to lots 4, 5, 6, 7, and 8, in Block C, please state to the Master what in your judgment was the reasonable market value of these lots on or about January 1, 1911?

A. I valued these at $26,400.

Q. Referring to lots 3 and 4 in Block *k*, shown on Exhibit 5, please state to the Master what in your judgment was the reasonable market value of those lots about January 1, 1911?

A. I valued those at $90 a foot or $11,800.

Q. Referring to lots 3, 4, 5, 6 and 7, in Block "T" shown on Exhibit No. 5, please state to the Master what in your judgment was the reasonable market value of those lots January 1, 1911?

A. $4,000.

Q. Now Mr. Arnold please tell the Master what the aggregate value of the several tracts of real estate to which your attention has been called was on or about January 1, 1911?

A. Did you call my attention to 1, 2, 3, 9 and 10, in Block C?

Q. I will ask you now, about lots 1, 2, 3, 9 and 10, in Block "C"?

A. I placed those at $75 a front foot or $20,000.

Q. Did I ask you about lots 3 and 4 in Block K?

A. Yes, sir.

Q. Have you given separately the valuation upon all the real estate of the Des Moines Gas Company?

A. That you asked me, that I have looked at.

Q. What is the aggregate?

2189 A. $96,200 unless I have made a mistake in figuring it up.

Q. You say now Mr. Arnold in your judgment as a real estate man that that is a reasonable market value of the property?

A. Yes, sir.

Q. That was $96,240?

A. $96,200 and something, yes.

Cross-examination by W. L. READ, Esq.

Q. Lot 3 in Block B you valued at $40 a front foot?
A. Yes, sir.
Q. Why?
A. No trackage only in connection with the other.
Q. That is also true of lots 2, 3, 4, and 5, in Block C isn't it?
A. There is trackage here—you are asking about B now?
Q. About C. You say that lot 3 has no trackage. I say to you isn't it true that lots 2 and 5 have no trackage?
A. If there is no alley through there but it makes it longer—that is true but you make 132 feet back here about as long as you usually get when you get beyond that it is the distance from t-ackage makes it a little bad.
Q. Lot 4, is just as far from the track as lot 3 isn't it?
A. No.
Q. Why not, lot 4 is the third lot from the track on Market street and lot 3 is the third lot from the track on Elm street?
A. But other parties I understand own the ground between, hence, it is not accessible.
Q. You think a depth of four lots is too much to count for trackage property so you leave off one lot?
A. Yes, sir.
2190 Q. Make it non t-ackage and then price it as non trackage?
A. Yes, sir.
Q. That is the idea?
A. Yes, sir.
Q. What uses do you assume that property is fit and adapted for?
A. For manufacturing and such purposes as its present us
Q. Storage?
A. Yes, sir.
Q. Manufacturing?
A. Yes, sir.
Q. It is well served by trackage?
A. Yes, sir.
Q. And I think you said that it was fit and adapted for the use which it is now devoted to?
A. Yes, sir.
Q. Do you know any place over on the east side south of Court Avenue west of Fifth street and north of Elm where one might obtain as much as two blocks and a half of contiguously located property for his use?
A. No, I do not.
Q. It is not over there?
A. I looked up about a year ago and had some maps, but I have laid them away.
Q. Do you know any place in west Des Moines south of Mulberry and west of 12th or 15th if you want to go that far west and north

of the Hubbell property where you could find as much as two blocks and a half of trackage property contiguously located?

A. No, I do not.

Q. It is not there is it?

A. I don't know. A. Not thoroughly. No I am just
2191 speaking—I don't remember, I don't know.

Q. Your impression is that there is no such body of land in that district?

A. It might be but I have not investigated, I don't know.

Q. What is the range of prices on Mulberry street and Vine street west in that district?

A. Where on Mulberry?

Q. Tenth and Mulberry, Seventh and Mulberry Eighth and Mulberry and along the same streets on Vine?

A. Well take it perhaps on Tenth and Mulberry some would make a difference on the south side and north, on the north there would be worth running back 132 feet would be worth $400 say at 10th and Mulberry.

Q. Well Tenth and Vine, Eighth and Vine, along in there, what would be the range of prices?

A. Vine is north of Elm, between Elm and Cherry?

Mr. BRENNAN: Vine is the Rock Island railroad.

A. I have not sold any in there, I have figured with some party there, but I have not sold any. They offered me the Ellsworth property there,—that is Seventh.

Q. That is all right, speak of that.

A. They offered me that about that time for $40,000.

Q. When was that?

Q. That is less than a year ago. I think last winter.

Q. What is it worth now?

A. Oh it is worth some more than that I think.

Q. That has been doing service with you quite awhile for cases of comparison hasn't it?

A. I don't know as I ever referred to it before.

2192 Q. It is worth more than $40,000 now isn't it?

A. Merely a matter of judgment.

Q. It has been sold for more than that lately hasn't it?

A. I understood it, but I don't know it to be a fact.

Q. What did you understand it to be sold at?

A. I just understood it was sold, I don't know how much.

Q. $60,000?

A. I didn't understand so.

Q. What did you understand?

A. Just that it was sold.

Q. As a real estate man you have had no curiosity to find out?

A. Not specially.

Q. The Sheurrman property is held at what?

A. I don't know where that is.

Q. Adjoining the property you just mentioned on the west?

A. I have not examined into it.

Q. Have you examined into the Des Moines Ice Company property?

A. No, sir.

Q. What is the property of the Des Moines Manufacturing & Supply Company on the corner do you know where it is?

A. I never looked into that. How much do they have?

Q. It is the corner of *east* First and Court, it is more than a

Q. It is the corner of west First and Court, it is more than a quarter block nearly a half block I suppose.

A. Well I think that would be worth $150 a front foot.

Q. The property just across the street on the north side of Court is worth what, that quarter block.

A. I don't know the names of the people over there, I could not refer to it by the names of the people.

Q. Refer to it by location, it is on the northeast corner of Court and First.

2193 A. Would it be a quarter block?

Q. 132 feet front.

A. On Court Avenue running back 132?

Q. Well goes back the depth of a lot, I suppose 132, yes.

A. I have not looked into this, I have some general idea. I would not make much difference with that and on the other side of the street.

Q. You are aware are you not that property has been purchased, the north side of Court for the use of Bentley & Olmsted Shoe manufacturing business?

A. I didn't know just where they did buy no sir.

Q. Do you know the price?

A. *Nom* sir.

Q. For your information I will state to you the price was $27,000 for the quarter block, $222 a front foot. How does that sound to you?

A. Sounds pretty big.

Q. Too big does it?

A. Yes, sir.

Q. You have constantly used the term you have not looked into these properties. What do you do, what do you ascertain when you look into them what process, how do you make out the value?

A. What they are good for or what they are liable to become in the future. What they may be used for, the surrounding trackage if any and other things that are liable to come near them.

Q. You have looked into the Des Moines Manufacturing & Supply Company property?

A. No, sir.

Q. So you don't know what it is good for, you don't know what the future is likely to be?

2194 —. ——.

Q. That is all you have of the gas property isn't it?

A. Well I looked into that more, I looked into that matter.

Q. You went over there and looked at it?

A. Yes, sir.

Q. What did you determine in that respect as to the future of the property?
A. I think it has a future to it.
Q. You didn't see much future to it did you?
A. Yes, I think it has a future to it, yes.
Q. It is good trackage property isn't it?
A. Yes, sir.
Q. Specially good?
A. I don't know especially good, it is good.
Q. It is close in isn't it?
A. Yes, sir.
Q. It is how far from the new city hall?
A. About three blocks.
Q. That is not very far is it?
A. No.
Q. Close isn't it?
A. Yes, sir.
Q. How far from the new post office?
A. According to what you call across the river. Not very far though.
Q. Across the river and south one block to the north line of it?
A. Yes, to the north line.
Q. It is close in well located trackage property isn't it?
A. Yes, sir.
Q. It is good trackage property?
A. Yes, sir.

Q. What is the Krtazer Carriage property worth on the
2195 west bank of the river fronting on Vine street?

A. I don't know how the railroads are, I don't know how that comes in the railroad I know where it is, I don't know how the railroads strike it.
Q. It has trackage on one end of it.
A. I don't know the shape of the ground and all that that enter into it.
Q. What about the Waffield Pratt Howell Grocer Company?
A. I don't generally aim to testify to things I have not looked into have a general idea.
Q. I just asked you about the Warfield, Pratt Howell Grocery Co.?
A. That is the Grocery Company on Walnut?
Q. Yes. I am speaking about these properties without the buildings, the ground alone?
A. That is on the corner of First and Court isn't it?
Q. Yes, the south side of Court?
A. How many feet have they got there?
Q. I suppose they have 132 feet, how much is it worth a front foot? In other words what is property worth at that place by the front foot?
A. $300.
Q. The Brown-Camp Company property on the north side of the street how much is that worth?

A. Well about the same across the street from it.

Q. About $300 a foot. Suppose you had a commission to gather up under one ownership or for one person two blocks and a half of trackage property inside and you were limited to a district in east Des Moines south of Court Avenue west of Fifth and north of Elm and limited on the west side between the river and 12th or 15th street south of Mulberry and north of Tuttle, what would
2196 it cost to gather up at prevailing current prices?

A. Oh I don't know as I could answer just what it would cost. There wo-ld be a difference in those places there I should judge but just what it would cost I would not want to say.

Q. What it would cost would be a pretty fair index of what it would be worth?

A. Not necessarily so.

Q. Why not?

A. Because if you had a little piece or good fair piece and wanted to make out the square you could afford to pay more to finish out the square than you could the little piece of land. You can't always judge property by what you can buy it for or what you sell it for.

Q. It would cost more humanly speaking to gather up a large tract such as two blocks and a half in such locality than to buy one lot independently?

A. Yes, sir.

Q. How much more, half?

A. I would not wonder if it would cost half more because when you start to pick it up the other fellow raises on his.

Q. You will run across some people who will not want to sell?

A. Yes, sir.

Q. And run across some people that had a notion as to what the value was and you would have to pay him his price wouldn't you?

A. Might not want to sell.

Q. So that you figure you probably would have to pay double?

A. Well have more any way, 50 per cent more to pick up that amount.

Q. You haven't handled any properties over in the vicinity there of the gas company property have you?

A. Not very close there. A little over on 4th street, but
2197 nothing to speak of.

Q. You haven't paid any attention to it? Over there?

A. Oh yes.

Q. You haven't paid much attention have you?

A. Not much no, but just a general idea.

Q. Your activities have been mostly in west Des Moines haven't they?

A. Mostly yes.

Q. Mostly in residence property?

A. Mostly.

Q. What business properties have you been interested in selling and handling as agent?

A. I have handled and sold to Mr. Hubbell the Ellingston prop-

erty south of Elm street near the track. Have some holdings on Mulberry.

Q. That was how much property?

A. Oh quite a little frontage.

Q. How much consideration?

A. $75,000.

Q. Aside from that what have you handled?

A. I have handled property on west Walnut street, some on Locust street some on Mulberry, some years ago, I have not late years, nothing very much in there.

Q. Of late years prices have run away from you haven't they?

A. No I don't think they have. They have got higher, I don't think they have run away from me.

Q. I was just wondering whether you have been able to keep up to them or not, whether you always try to buy at low prices. There has been a good deal of property handled in there?

A. Yes, sir.

Q. You haven't handled it all?

2198 A. No, sir.

Q. In fact mighty little of it haven't you?

A. Very little of it yes.

Q. You haven't handled any over in the east Des Moines district?

A. I have had something to do with some over there, I have not been agent for any properties except lots and there are several ypu can pick up there at your own price on Fourth street. On east First street over there are several little houses and lots and on Fourth street south little houses and lots and a year age I took about a half a day or a day to look up matters from Fifth street to Ninth street along trackage and prices on them and I tried to find that map.

Q. From Fifth to Ninth on the east side?

A. Yes, sir.

Q. Where did you find any trackage property in there?

A. All along on the track I found different lots, not big pieces I could buy together.

Q. Of course that district over there is not a retail district, no depand for small lots?

A. Not a retail. I picked up several there, I tried to find that plat, I didn't want to go over it again to see the places given me, but it was much lower than——

Q. West Des Moines?

A. And than I gave you on the gas company too.

Q. By the bye, how did you figure out the gas company valuation, precisely the basis and method of determining value you have given us on the gas property?

A. There is only one way I know of and that is to draw to some extent on your imagination what the thing is going to be in the future, what it has been in the past and the uses that it can

2199 be used for in the process of development.

Q. And from that somehow in some manner you evolve prices and values fo you?

A. Yes, sir.

Q. How do you do it, how did you do it in this case?

A. I just told you.

Q. I don't understand.

A. Just the same process, take what it had been and the price that it is liable to be in the future chance of future growth and uses to which you can use it in the meantime and income you are liable to get out of it and the interest on your investment in the future. No other way I know of.

Q. You didn't figure this from the point of view of the utility to a person who wanted to use so much as the entire tract of the gas company?

A. Oh yes, what it is used for now yes.

Q. What use did you make of that thought in arriving at your valuation?

A. From the us*u*ing it and it is perhaps to continue to use it.

Q. What conclusion did you reach as to the value of the use of the gas company?

A. Per*g*aps it would pay them a percentage on that investment in the growth of it.

Q. Don't you think a good way to have determined something about *about* value was to have undertaken to gather together so much property in the same locality equally closely situated in?

A. No, I don't believe that would be a good way to do it.

Q. Why not?

A. Well it would not be the true way.

Q. Why wouldn't it be the true way?

2200 A. You might find difficulty in getting that in one locality now. There have been other tracts.

Q. The gas company is using this company now isn't it?

A. Yes, sir.

Q. It seems to your understanding to serve the company's use, the property seems to be well enough adapted?

A. Oh yes.

Q. Suppose something were to happen that would deprive the gas company of the use of this property and it was obliged to get another property equally large and equally convenient, equally adapted for its service, be equally convenient I mean situated no more remotely from the center of the city than it is. Now I asked you some time ago what it would cost to procure that much property in some of these other localities and you didn't answer me.

A. I don't know where I could get it.

Q. Take it in the west Des Moines district which I named then it would cost two or three times as much wouldn't it?

A. I don't know what could be bought. What I sold sold for a good deal less.

Q. You are talking about the Ellingston property?

A. Yes, sir.

Q. That has been sold since that time at a good deal more money?

A. Oh no, it has been resold. I don't understand the Ellingson property has ever been sold.

Q. It would cost very much more than it would cost in east Des Moines, the same locality I have described?

A. I have that thought in mind if they ever abandoned it it could be sold to anybody else.

Q. I am not supposing an abandonment of it. I asked
2201 you if it would not cost a great deal more money to buy an equal area of ground in west Des Moines between the river and Fifteenth street and south of Mulberry and north of Tuttle two blocks and three quarters wouldn't it?

A. Yes, it would cost more on the west side, yes.

Q. How mucy more?

A. Oh cost more, considerably more.

Q. Two or three times as much?

A. Yes, sir.

Q. More than that wouldn't it?

A. Well I don't know where you can get it, that is the long and short of it.

Q. Well pay your money until you get it?

A. A man would say he didn't have to have it, he would go out farther.

Q. At any rate it would cost two or three times as much?

A. A man would say he would not have to buy it, would go out farther, a man has the privilege you know.

Q. Now go over in east Des Moines in this district I have described to you and assume a requirement for two and three quarter blocks or two and one half blocks contiguously located. Won't you have to pay for it now more than the valuation you have placed on this gas property?

A. I doubt it.

Q. Where will you get it, point out on the map where you will get it.

A. As I told you I went over that very question a year ago and looked into it and I could at that time buy and I think——

Q. You could have bought one or two together?

A. In pieces all along there.

2202 Q. I told you two blocks and a half or two and three quarters contiguously located. You don't answer me by saying you could buy isolated lots. I inquire again where would you secure two blocks and a half or three quarters contiguously located?

A. I tell you again that I have not looked into it hence I don't know where I would go to get it.

Q. From your knowledge of that district in east Des Moines you don't know where you would find it do you — it is not there?

A. Well, I don't know, I would not say that. I would not say it is not there. The chances are it is there but I have not looked it up.

Q. Look at this map Exhibit 38 and see if you recognize that and recognize the buildings and institutions in that district and then say in view of that whether you can point out where you can obtain so much ground there?

A. I have not looked into it,I don't know.

Q. I ask you to look into it now.

A. Before I did that I would want to go see it to satisfy myself. I heled up my hand when I came in here to swear to the whole truth.

Q. You came in here to swear to your opinion?

A. Yes, as I view it, you are asking things now I know is only guess work.

Q. Speaking from your present information you don't know where you would go to find such a tract of land?

A. I have not looked in the matter there to find out.

Q. You have told me that several times, but you don't know now where you could go to look for it do you? You don't know of any such tract of land on the market.

A. No, I don't know to say that was on the market.

2203 Q. You know pretty well over there the different institutions, within the district don't you?

A. Yes, sir.

Q. There is the Des Moines Manufacturing & Supply Co., Eagle Iron Works, American Linseed Works, and the different institutions there, Nichols & Shepherd, you know of those?

A. Yes, sir. You may go down along east——

Q. That groung *is* pretty well taken up isn't it?

A. Yes, sir.

Q. Somebody said this morning that there was at least seventy five per cent of it taken up, that is about true isn't it?

A. I would think so yes.

Q. These institutions over there are going concerns as far as you know and for all we know they will keep on going won't they?

A. I hope so.

Q. Nobody offering to sell out over there, none of these institutions.

A. Not that I know of.

Q. Now if you had a commission to buy two blocks and a half or two blocks and three quarters of ground over there in that district and you were to go and gather up paying the current prices *prices* that would be sufficient to induce the people to sell, pay prices that were asked, when you got through you would have a good deal more money in that two blocks than you have given as the price or value of the gas company property wouldn't you?

A. I don't know that to be a fact.

Q. What is your opinion about that.

A. I don't know what it can be bought at.

Q. You have no opinion?

A. I have an opinion but I doubt if I could get it at all

2204 I don't think — would cost any more.

Q. I wonder why you say that. Tell me the thought in your mind.

A. Because I don't believe they are worth any more.

Q. I don't get that distinctly either?

A. If you will put it so I can get at it I will try to inform you to the best of my knowledge.

Q. What makes up worth?

A. I told you that. The future prospect and past and present uses.

Q. You have made a statement that if you could buy such a tract of ground at all you don't believe it would cost any more than your appraised value of the gas property, I ask you why and you said because it was not worth any more than that. Do you mean by that to say that people would be willing to sell at such prices?

A. I don't know what they would do, that is another question.

Q. Is there a difference between what property is worth and what people who own it are willing to sell it for?

A. Yes, difference in values. A great many people ask more than their property is worth. Some don't want to sell it. That don't establish values always.

Q. What does establish values in your estimation?

A. I have told you three times.

Q. Past present and future?

A. Yes, sir.

Q. If you have a man who wants to buy property and find a man who wants to sell, if they come to an agreement then you have fixed a price?

A. Yes, sir.

Q. You have fixed a value of it have you?

A. Not necessarily so.

2205 Q. What is the difference between value and price?

A. Just as I explained awhile ago I might have three quarters of a block and pay a man a big price to finish the square out or I might have frontage or inside track and might want to get on the corner, all these things come in.

Q. These things are abnormal. What is the difference between price and value, is there any difference?

A. I think many people sell for less than va-ue and some sell for more than value. For instance if a party had a big mortgage on a place I might buy for less than it was worth.

Q. That would be an abnormal condition.

A. I don't know, those conditions exist every day, we meet them.

Q. If you find enough of them of course you would have glutted market, but going back to the question you are undertaking to say you would not have to pay more for two blocks and a half than the price you have given because it was not worth that.

A. Once you go north——

Q. I am not going north, we are keeping within the district.

A. I say I don't believe if I could get the ground I would have to pay more than that, that is what I said.

Q. If you could get the ground for that price naturally you would not. Could you get the ground for that price?

A. I haven't looked into that, I don't know.

Q. You don't know where there is such ground?

A. No.

Q. You said awhile ago to reduce to one ownership so large a tract would probably — 50 per cent more?

A. More than what?

Q. More than the price for isolated lots.

2206 A. You misunderstood me, I said to find that would cost 50 per cent more to get together property to make that would be that much. I didn't mean to convey the idea that this piece of ground because of that is worth 50 per cent more than I put on it. I have taken that into consideration.

Q. I didn't intend to say anything to increase the price of the particular property, I was talking about prices generally. If this piece of property was in small tracts it would not be worth as much.

A. It has value in it because a large tract.

Q. You have only considered it in quarter blocks and in one case an isolated lot?

A. One case a whole block I think. One whole block.

Q. And one isolated lot?

A. Two quarters.

Q. And one isolated lot?

A. Yes, sir.

Q. That is on the theory more than 32 feet was not trackage property.

A. Well not necessarily, the back end is not as valuable.

Redirect examination by R. O. BRENNAN, Esq.:

Q. You have I take it from the length of time you have resides in the city and by virtue of your occupation, you have been over the city some have you not?

A. Yes, sir.

Mr. READ: I want to suggest that you do not lead this witness, let him answer the questions.

Q. Counsel has confined you exclusively to a little district
2207 over there in the vicinity of the gas works. Now let's go outside of his favored zone just for a few minutes and tell the Master if you know where there are other sites for manufacturing purposes?

A. Further east you can get them.

Q. Say within a radius of a mile or mile and a half of the present gas works?

A. You can get blocks in along about east 20th and 22d and down in there.

Q. What is the general range of prices of real estate in that vicinity?

A. That is very much less that would be five to ten dollars a front foot.

Q. Is the property you now refer to contiguous to railroads?

A. Yes, sir.

Q. Now going east of the manufacturing plant of the gas company are there any available sites a mile or a mile and a half east of that point?

A. Out on the Rock Island, branch of the Rock Island about 20th there are several large chunks in there can be bought.

Q. Several large tracts you say?

A. Large blocks, yes.

Q. That would be 20th street, that would be how far from the east line of the gas company's property?

A. That would be over a mile east. About 14 blocks makes a mile does it not.

Q. Well I understood 16.

A. Be something over a mile at least.

Q. In the neighborhood of a mile would it not?

A. Yes, sir.

2208 Mr. READ: We object to this line of inquiry because it is immaterial and not any aid in any way, they are differently and more remotely situated properties.

Q. Proceeding north of the Rock Island tracks say up along the Des Moines & St. Paul Railroad company right of way, and the Chicago Great Western right of way, have you in mind any tracks of ground that would be suitable or adaptable for manufacturing purposes?

A. I think you can find a good deal, I know they have not sold all of them.

Q. Well do you know of any sites in that part of the city which may be utilized for these purposes?

A. Blocks can be bought there in T. E. Brown's official plat, somewhat south there is one tract I think you can buy most of it ten acres I think would be suitable for it right near University Avenue and the Great Western.

Q. What is acreage worth in that part of the city?

A. Oh lots or land in there would be worth perhaps $10 a front foot, eight to ten dollars.

Q. That is north Avenue on the east side of the river?

A. Yes, sir.

Q. That is where you refer to Mr. Arnold, North Avenue?

A. Yes, sir.

Q. Now pursue the same course north and west going up into Highland Park out in that way, are there any manufacturing establishments?

A. On the Interurban or Urbandale.

Q. I mean on the interurban railway?

A. Yes, sir.

Q. Go out north on the interurban we have the Flint
2209 Brick works and the other manufacturing establishments do we not?

A. Yes, sir.

Q. And then south Des Moines, what do you say as to south Des Moines having any sites?

A. Plenty of them I should think.

Q. Which could be used for manufacturing purposes?

A. I should think there would be plenty of them.

Q. And which would be contiguous to railroads?

A. Yes, sir.

Q. In other words, Mr. Arnold, if we were to start out today to construct a gas works and this site to which attention has been

called was not available would you be able to find another site in the city of Des Moines?

A. I think I would.

Q. Now I will ask you if the valuation which you have placed upon the real estate of the Des Moines Gas Co. exclusive of the buildings and improvements thereon represents your independent judgment uninfluenced by the valuation that others have placed upon it?

A. It is my own judgment.

Recross-examination by W. L. READ, Esq.:

Q. I take it you have been stating that there are properties, trackage properties within the corporate limits of Des Moines that are cheaper in price than those over here of the gas company?

A. Yes, I think there is.

Q. That is the purport and effect of your testimony wasn't it?

A. Yes, sir.

2210 Q. Now of course you don't undertake to say that you know anything about the requirements of the gas company, what kind of property it would need?

A. No.

Q. Or adapted to it?

A. No, only a general idea of it.

Q. When you say you know that, you would want to look into it, and find property for the gas company, all you mean to say is that you could find a piece of ground that if it was adapted to the situation and other places that a gas plant could be put on it?

A. Yes, sir.

Q. But whether it would be the best practical place to put a gas plant you don't undertake to say?

A. I have not looked into that no sir.

Q. You don't know anything about that subject?

A. No.

Q. You could not look into that subject?

A. I am not posted on that subject.

Redirect examination by R. O. BRENNAN, Esq.:

Q. You don't know anything peculiar about the gas works requiring it to be say next door to Harris-Emery's or Younker Bros., or anything of that sortn do you. Nothing occurs to you as a reasonable man to suggest anytying of that sort is there?

A. No.

Mr. READ: You haven't looked into that subject either.

Witness excused.

2211 A. S. WILCOXEN being called on the part of the defendant and sworn and examined in chief by R. O. Brennan, Esq., testified as follows:

Q. You reside in Des Moines do you?

A. Yes, sir.

Q. Where is your residence?

A. 1730 Arlington.
Q. How long have you lived in Des Moines?
A. Since 1871.
Q. What has been your business since you have been in Des Moines
A. The last 18 or 20 years real estate.
Q. What is the character of the real estate which you have handled or dealt in?
A. Well some business property, some outside property, general real estate.
Q. Bought and sold for yourself and for others?
A. Yes, sir.
Q. And have handled some business property?
A. Very little.
Q. But some.
A. Yes, sir.
Q. You keep in touch with sales of business properties?
A. I try to.
Q. I will ask you Mr. Wilcoxen if in the course of your business as a real estate man yon know what the reasonable market value of real property was in the city of Des Moines say about January 1, 1911?

A. I think so.

2212 Q. Do you know the property of the Des Moines Gas Co. in east Des Moines?
A. Yes, sir.
Q. How long have you known that property?
A. Well for a great many years.
Q. Have you bought or sold or had listed with you by the owners any property adjacent to the property of the Des Moines Gas Company?
A. Yes, sir.
Q. I will ask you if you know what the reasonable market value of the real estate of the Des Moines Gas Company was on or about January 1, 1911, exclusive of the buildings and improvements thereon?
A. I think so.
Q. Now if you will refer to the blue print or plant marked Exhibit 5 before you, I wish you would take the property shown thereon and known as lots 9 and 10 in Block M and tell the Master what in your opinion was the reasonable market value of these lots on or about January 1, 1911?
A. $7,000.
Q. Referring now to lots 9 and 10 in Block B, Scott & Dean's Addition shown by the plat, please state what in your judgment was the reasonable market value of these lots at the time referred to?
A. $6,000.
—. Referring to lots 3, 4 5, 6, 7 and 8 in Block B shown by the plat Exhibit 5, tell the court what in your judgment was the reasonable market value of these lots at the time referred to?
A. $20,000.

Q. Referring now to lots 1, 2, 3, 9 and 10, in Block C
2213 shown upon the plat, please tell the Master what in your judgment was the reasonable market value of these lots at the time referred to?

A. $17,000.

Q. In that same block, Block C I wish you would refer to lots 4, 5, 6, 7, and 8, shown upon the plat and tell the Master what in your judgment was the reasonable market value of these lots at the time referred to?

A. $22,000.

Q. Referring now to lots 3 and 4, in Block K of Exhibit No. 5, state to the Master what in your judgment was the value of those lots at the time referred to?

A. $10,000.

Q. Referring to lots 3, 4, 5, 6, and 7, in Block T shown on Exhibit 5 please state to the Master what in your judgment was the reasonable market value of these lots at the time referred to?

A. $3,000.

Q. Having given the va-ues of the respective pieces of property to which your attention was called I wish you would tell the Master now what the total or aggregate value of the real estate of the Des Moines Gas Company was exclusive of buildings and improvements say on or about January 1, 1911?

A. $85,000.

Q. I believe you have said the valuation you place upon this property is based upon your general knowledge of real estate values gained by your experience in the real estate business in Des Moines?

A. Yes and what like property is worth in that vicinity.

Q. And what property would sell for in that vicinity
2214 A. Yes, sir.

Cross-examination by W. L. READ, Esq.:

Q. Have you considered what the property as a whole would sell for?

A. No, sir.

Q. It is only when cut up in piece mea-, this way that you have considered the price at all?

A. Yes, sir.

Q. Then you have no notion as to the value, at least you are not prepared to value the property as a whole?

A. Well that is the total valuation of the property in my judgment taken it as a whole.

Q. You answered my question a moment ago you had not valued the property as a whole?

A. Well my estimation of the property valued as a whole is $85,000.

Q. Did you consider the property as a whole for the purpose of valuation?

A. No, I took it in detail.

Q. Why did you do that?

A. Because I thought it was the more just way to arrive at a conclusion of the value of the property.

Q. More just from what point of view?

A. From the fact that some of it was worth more than others and *and* some less.

Q. What difference would that make when you consider it as a whole?

A. I considered it as a whole when I got through the estimates on the pieces.

Q. That is simply the aggregate of your piece meal estimation?

2215 Q. What concern have you, why should you concern yourself with the value in piece meal when the question is what is the property worth as a whole?

A. $85,000.

Q. But why trouble yourself to find out what the piece meal valuation is when you are asked to tell what the property is worth as a whole?

A. Because I was asked to find out what in my opinion was the value of the property describing it by lots and I priced it that way.

Q. By lots?

A. Yes, sir.

Q. You seemed to have included several lots?

A. Yes, the sum total.

Q. You didn't consider it by lots?

A. Indeed I did.

Q. For instance you have the valuation of lots 3, 4, 5, 6, and 7, Block T?

A. Yes, sir.

Q. You valued these by lots did you?

A. No, sir; I didn't that particular piece of property.

Q. You valued that as a whole?

A. As a whole because it is very shallow.

Q. Lots 3 and 4, in Block K did you value those two lots as a whole or did you value them separately?

A. No, sir; I think I considered those as a whole.

Q. Are they worth more the lots separately or taken as a whole?

A. Lot 4 is worth more than lot 3 if taken separately.

Q. Lot 3 is worth how much?

A. About half the price of four.

Q. Will you answer my question now are the two lots taken together worth more than the separate lots, for instance Lot 3,

2216 you say is worth about $2000, how much is lot 3 worth according to your valuation.

A. Worth about $3000, $3500 possibly.

Q. Lot 4 taken separately and without regard to Lot 3 is w[illegible] how much?

A. Worth from $6000 to $7000.

Q. Why is Lot 3 worth less than Lot 4?

A. Because it hasn't the trackage.

Q. Lot 3 is worth $3000 and Lot 4 worth $7000.

A. Yes, sir.
Q. Why then is lot 3 worth less than lot 4?
A. Because it has not the trackage.
Q. You have assumed now that the unit of greatest availability there would be a single lot have you?
A. No, I can't say that Mr. Read.
Q. That is not a retail district over there is it?
A. No, sir; it is not.
Q. Such demand as there is over there is for larger tracts than a single lot as a rule?
A. Well I don't know as to that.
Q. Well do you know to the contrary, what do you know about it?
A. No, generally consider about 66 feet as a pretty good lot for factory site or for warehouse.
Q. So you assumed then that a larger tract over there is no more in demand and hence a greater value relatively than a smaller one? In other words you assume that 66 feet frontage is the normal size.
A. Yes, sir.
Q. For factory and warehouse and storage purposes.
A. Yes, sir.
2217 Q. Do you know anything about what the fact is as to that. That is I mean what do you know about that being the fact?
A. Well that is generally the size they are sold in.
Q. In Block C Lots 4, 5, 6, 7, and 8 were they separately valued or valued together?
A. They were considered together.
Q. Why did you consider them together?
A. Because it is a quarter of a block making 132 feet square.
Q. Wasn't that too -arge to give them their greatest value according to your theory?
A. They gave got the same trackage the other has.
Q. They haven't got trackage have they according to your theory?
A. Yes, six has got trackage on it.
Q. Lot 5 hasn't trackage on it?
A. No, sir; nor four.
Q. Nor three nor two?
A. N-, nor three nor two.
Q. Well you considered them together anyway?
A. Yes, sir.
Q. Is that true of the other properties?
A. Yes, sir.
Q. All of them?
A. Yes, sir.
Q. All considered together?
Q. Yes, sir.
Q. By their value what do you mean?
A. Do you mean how I arrived at the value of the property?
Q. No, I mean what conception you have of value, what does value mean as you use it?
A. Well what property can be bought and sold for.

2218 Q. Under normal conditions.

A. Yes, sir.

Q. A willing buyer and willing seller?

A. Yes, sir.

Q. Turning now a moment to the idea of the property as a whole do you think this property as a whole, that is say ta-ing practically two blocks and a half or two blocks and three quarters lying contiguously and being trackage property and being capable of serving some establishment for large area such as the gas company serving such a demand is worth more as a whole than its constituent parts? How do you find its greatest value?

A. Well I don't know as I understand your question Mr. Read-

Q. This property is over there and it is devoted to this use of the gas company.

A. Yes, sir.

Q. It may be assujed that the gas company requires that much property now. If some other concern were coming to Des Moines and wanted that much ground located on trackage, trackage property would that ground sell for more because of the fact that it is in one body or would it be worth less? In other words is it worth anything to have so much property as that under one ownership?

A. Yes, it is probably worth more than it otherwise would be. If you will find a man that wants that much ground.

Q. Suppose you were to start out with a commission to get together over in east Des Moines in the district lying south of Court Avenue and west of Fifth street and north of Elm, what price do you suppose you would have to pay for it to get together property under one ownership having in mind now the uses that are being made of the various properties over there.

A. Well you are restricting that to a very narrow locality, I
2219 don't know whether a man could find it or not.

Q. Well do you think you could in that district?

A. Oh I could find plenty of pieces over there, but whether I could get together two blocks and a half together contiguously I don't know.

Q. Could find plenty of small pieces?

A. Oh I could pick it up, simply a case of what you have got to pay for it.

Q. How long would it take you to do that do you suppose?

A. Oh I don't know.

Q. What pieces could you find over there?

A. There is one the corner of Third and Market street- over there, I think Third and Market.

Q. That is the one you called Mr. Hauge's attention to?

A. I guess so, I didn't know he testified in regard to it.

Q. Tha- is one piece you have in mind is it?

A. Yes, sir.

Q. Who owns that?

A. By the name of Hyland.

Q. Live here or away?

A. Lives here.

Q. What frontage is there there?
A. It is 132 feet frontage of 66 feet.
Q. Frontage on what street?
A. Third street.
Q. And the side on the track?
A. Yes, sur.
Q. Well what other piece?
A. That is the only trackage piece I have for sale there.
Q. That is the only trackage piece?
2220 A. Yes, sir. I have some property down below the gas works——
Q. I asked you to stay within the limits, north of Elm street.
A. I am within the limits. I have three pieces there on Raccoon street, Raccoon and Third 132 feet square in there taken as a whole can be bought for $7800.
Q. Raccoon street is south of Elm street isn't it?
A. I don't know whether it is or not, lays right across the alley from the——
Q. Raccoon street is the street south of Elm street isn't it. One tract on Raccoon street.
A. This is the property in here. This is the gas company property here.
Q. It is the southeasy corner of Block M?
A. Yes, sir.
Q. You say this property you have this listed?
A. Yes, these three pieces here.
Q. That is not trackage property?
A. No.
Q. I asked you to confine yourself to the district north of Elm west of Fifth and south of Court?
A. I don't think you can get it in there unless you have the right of eminent domain.
Q. Why can't you get it?
A. Because largely controlled by railroads and they won't sell it.
Q. There is the Des Moines Manufacturing & Supply Co. property in there?
A. Oh yes they might sell there.
Q. There is all of Block "D" isn't there?
A. "D" yes.
Q. All of Block "I" isn't there?
2221 A. There comes the railroads in there, I don't know how much ground they have got.
Q. Those two blocks in there what would it cost to gather up those two blocks?
A. I don't know what it would cost to gather them up.
Q. It would cost a good deal more than your valuation on the two blocks of the gas company?
A. Yes, they are worth more up here than down there.
Q. How much are they worth?
A. This ground in here I think is worth, probably 132 feet in

there is worth—this is Court Avenue over here and that ground in there is probably worth $200 a front foot.

Q. You are referring to the property of the Des Moines Manufacturing and Supply Co.?

A. Yes, sir.

Q. The northwest quarter bloack of Block "D"?

A. Yes, sir.

Q. $200 a front foot?

A. Possibly that.

Q. What is the other the northeast quarter block worth?

A. Well I don't think that is worth as much money.

Q. Why not?

A. Not as desirable property.

Q. Why not as desirable.

A. I don't think it is as desirably located.

Q. What is the difference in the location, what makes it less desirable?

A. Well I think this is better business property.

Q. What makes it better?

A. This is simply my judgment.

2222 Q. What qualities or characteristics, what quality makes that better the one than the other?

A. I think it a better location.

Q. Why?

A. Because I think so.

Q. Is that as far as you go with it, any reasons why?

A. Yes, sir.

Q. What reasons?

A. Because I think it better located.

Q. What is property in Block I worth fronting on Grand Avenue?

A. Probably $150 a front foot.

Q. Why that $150 and the other corner $200?

A. The same reason I gave before I think better located.

Q. Do you know anything about what holding prices are of this property?

A. I do not.

Q. What is property worth on the north side of Court Avenue on the northeast corner of First and Court, that quarter block in there 132 feet?

A. It is worth about the same as this here.

Q. About $200?

A. Something like that.

Q. That is the property purchased by Bentley & Olmsted?

A. I don't know.

Q. Don't know whether that property was purchased at $27,000?

A. I don't know.

Q. You don't know anything about property over there?

A. I don't know what that property was purchased for.

Q. Do you know anything about the holding prices of property on Court Avenue, First to Fourth?

2223 A. I do not.

Q. Do you know anything about prices on Walnut street east First to Fourth?

A. No, I have none for sale.

Q. On east Locust street First to Fourth?

A. Only in a general way.

Q. Do you know what the holding prices are?

A. I think about $150 to $200 a front foot, $250.

Q. That is the maximum is it?

A. I think so, $200 to $250.

Q. Do you know what the city paid for the city hall site a few years ago?

A. I don't know only what was in the paper, I suppose $78,000.

Q. That was about 100 feet frontage on Locust street?

A. I don't know the frontage, I presume it is.

Q. Ever try to figure out what that would be per front foot?

A. No, sir.

Q. About $390 for the frontage on Locust street and the same for frontage on Grand Avenue wouldn't it?

A. It runs clear through, yes, one side to the other. It would be about that price I expect. I hadn't figured it out.

Q. Do you know any sales on east Locust street in the last year?

A. No.

Q. The last two years?

A. No.

Q. Any sales on Walnut street the last two years?

A. No.

Q. Where is your office?

A. 607 Iowa Loan & Trust Building.

Q. You say you have handled some inside property?

2224 A. Yes, sir.

Q. You said not much though?

A. Yes, sir.

Q. What property have you handled?

A. Well I was instrumental in the sale of the property to the C., B. & Q. railroad company there on Seventh street.

Q. That the only one?

A. The only recent one.

Q. What is the bulk or aggregate of your real estate transactions last year?

A. It varies, $115,000 to $130,000, some years only $40,00- or $50,000.

Q. When was the Q. property purchased?

A. This year.

Q. What time this year?

A. I think probably May some time probably May.

Q. How much property was there?

A. I think they bought 132 feet square, was a piece 132 feet square.

Q. On the east side?

A. No, sir.

Q. Where?
A. Seventh and Market.
Q. Are you acquainted with values over on west Vine street, Seventh street, Eighth street and along in there?
A. Some little.
Q. Do you know the Sheruerman property?
A. I know its location, yes.
Q. Do you know the value of it, know the holding price?
A. I do not.
Q. Did you hear it was $50,000?
A. No, sir.
2225 Q. Do you know the Illingston property?
A. I know the location of it.
Q. Has it been sold lately?
A. I was told it had been sold, yes.
Q. What price?
A. I think it was $50,000.
Q. Do you control any property along there?
A. No, sir.
Q. Haven't been interested in handling any of these properties there?
A. No, sir.
Q. What is the property of the Kratzer Carriage Company worth per front foot, trackage front foot?
A. I suppose that is worth about $400 a front foot.
Q. That is just across the river from the gas company?
A. Yes, sir.
Q. What is the Brown-Camp Hardware Company property worth, the ground?
A. About $500 a front foot.
Q. The Warfield Grocer- Co.
A. Right across the street from it, about the same.
Q. About $500?
A. Yes, sir.
Q. You said you had some properties near the gas company listed with you, what properties do you refer to?
A. These properties in Block M.
Q. The ones you have already referred to?
A. Yes, sir.
Q. Have you any others than those?
A. Nothing excepting this one that belongs to Mr.—well
2226 the corner of Third and Market.
Q. That belonged to Mr. Hyland.
A. Yes, sir.
Q. This piece and three pieces in Block M?
A. That one there and three pieces in Block M.
Q. What three pieces in Block M the south half?
A. Yes, sir.
Q. Non trackage property?
A. No, sir; not trackage property.

Q. Where is the other piece?
A. On Third street.
Q. On the west side of Third street?
A. Yes, sir.
Q. South of Market?
A. Yes, sir.
Q. A quarter block there?
A. No, sir; 66 feet. The other belongs to the railroad company.
Q. These two pieces are the only pieces that you have listed with you?
A. In that locality yes.
Q. And so far as you know the only pieces for sale.
A. Yes, as far as I know the only pieces for sale.
Q. Precisely how do you get at this valuation, how do you do it, what were your assumptions, what was your basis?
A. Well I took the valuation there on like property what it could be bought for.
Q That is the first proposition. Now where is the like property?
A. This specific piece of property I have mentioned, Mr. Hyland's property on Third street.
Q. You call that like property?
A. Yes, sir.
2227 Q. You distinguish between the Des Moines Manufacturing property and the gas company property didn't you?
A. Yes, sir.
Q. But don't distinguish between the gas company property and this other?
A. No, sir. That is down below the railroads farther.
Q. The property on Market street was listed with you at a certain price?
A. This property, yes.
Q. At what price?
A. $7,000.
Q. That was so much a front foot?
A. No, sir; it was not the front foot at all, listed by the lots. If you take 132 feet frontage, take the trackage part of it——
Q. There was a lump price given?
A. $7,000.
Q. You said that property was the same as the company's property, like property?
A. For trackage, yes sir.
Q. So far as the gas company property was trackage?
A. Yesk sir.
Q. And then you placed the same valuation on the gas company property?
A. Not entirely no.
Q. Well so far as the gas company's trackage property was concerned?
A. I took that as a basis, yes.
Q. Well did you call the gas company property worth more or less?

A. I think more.

Q. What particular properties and lots or groups of lots
2228 did you call more and what less?

A. Well I think I took it by the trackage.

Q. The trackage property you called the same?

A. Practically the same, yes.

Q. And the property that you considered non trackage, you called it less?

A. Well I considered it as a quarter block.

Q. Was there some of the gas company property which you did not call trackage property?

A. Yes, sir.

Q. What?

A. This down here in M.

Q. Name them b- lots?

A. It is 9 and 10 in M.

Q. Is that all you did not consider as trackage property?

A. No, sir, I think some of these lots in here 9 and 10 in B I did not consider trackage property.

Q. Nine and 10 in Block B did you call that trackage property?

A. I don't think so.

Q. There is a track on Elm street isn't there?

A. Yes, and track on Market.

Q. Lot 10 in Block B and lot 9 in Block M front on Elm street don't they?

A. No, sir.

Q. Abut on Elm street.

A. Oh 9 and 10 in M, yes that is right.

Q. Your lot on Market street and Third has what railway track along the side of it?

A. Has the Rock Island.

Q. How do you figure out that property trackage property
2229 and these others not?

A. I see that I was mistaken, I didn't notice this railroad in there, this is trackage property.

Q. Now to go back was there any gas company property you did not consider as trackage property and if so what, give the lot number?

A. No, sir; I guess there was none of it.

Q. Then the basis of the valuation was the price at which you had listed with you the Hyland property, the property at the corner of Third and Market?

A. Substantially so.

Q. What do you mean by substantially?

A. Well I took that as the basis of what the property was worth.

Q. What was the next step?

A. I took that as the basis of what the property was worth.

Q. What use did you make of that basis?

A. Considered the value of the other property on like trackage.

Q. Did you call the trackage the same or was it dissimilar in you- consideration?

A. Nom because the ground laid better in the gas company, I don't know whether it has been filled or what.

Q. Made some allowance for the fact your ground was low ground below grade and the gas company property up?

A. Exactly.

Q. What allowance did you make for that?

A. I am not prepared to say what allowance, I took that into consideration.

Q. Anyway the basis was the price at which the owner valued the Market and Third street lots with you?

A. Yes, sir.

2230 Q. And that was all there was to it. I mean that is the method and basis by which you arrived at your valuation?

A. Yes, and this other property down there in Block M could be bought a quarter block for $7,800 I took that into consideration also.

Q. That was non trackage property.

A. Yes, sir; non trackage property.

Q. Used that to put the price down?

A. No, sir; I tried to consider it altogether.

Q. The basis of your valuation of the gas company property was the price at which there was listed with you the 66 feet on the corner of Market and Third street- and the price of the two quarter blocks in Block M?

A. Yes, sir.

Q. Now what price did you make in the gas property relatively you have the same area which was concerned, practically the same?

A. What do you mean, in taking into consideration a large block?

Q. Well a particular quarter block or particular lot. For instance a 66 foot lot on the corner of 3d and Market was listed with you for $7,000?

A. Yes, sir.

Q. Now go over in Block C and you will find lot 7, is on east Second and abuts on Vine street, what did you call that worth?

A. I didn't consider that, I took the two lots together.

Q. What two lots?

A. Seven and eight in C.

Q. What did you call the two together worth?

A. $11,000.

Q. How much did you call seven worth alone?

A. I didn't consider that alone Mr. Read. I took the half

2231 block by itself, both got equal frontage in there and priced it at $22,000.

Q. You didn't call lots 7 and 8 worth twice as much as you call the one 66 foot lot over in the other block east, did you?

A. No, sir; I did not.

Q. Why did you call it less?

A. Because seven has trackage and 8 has not.

Q. Suppose you were to divide lots 7 and 8 north and south so as to make two 66 foot lots facing north, what about them?

A. Well it would be trackage frontage that governed the price then, be worth practically the same.
Q. Have 132 feet frontage?
A. Yes, sir, be 132 feet deep, could not be 132 feet trackage, but 132 feet deep.
Q. So wouldn't they be worth by the same method $14,000?
A. You have no more trackage.
Q. Depth don't count then in your estimation?
A. Surely, you have got 132 feet in depth there.

Here the further hearing was adjourned until 9:30 a. m. tomorrow.

2232 Tuesday Forenoon Session.

AUGUST 15, 1911, at 9:30 a. m.

Counsel for the respective parties all present.
Testimony on part of defendants resumed as follows:

A. S. WILCOXEN, re-called for further cross examination, examined by W. L. Read, Esq., testified:

Q. I think, Mr. Wilcoxen, we were considering lots in Block C, weren't we?
A. I think it was M, Mr. Read, I don't remember.
Q. Lots 3 and 4 in Block K, you may direct your attention to that now. You had placed a valuation of $10,000 upon the two lots and as I recall it, yesterday evening you placed a valuation of $7,000 on Lot 4 and $3,000 on Lot 3, is that right?
A. What block is that?
Q. Block K?
A. $10,000, yes sir.
Q. And you said, I think, didn't you, $7,000 on Lot 4 and $3,000 on Lot 3?
A. About in that proportion, yes sir.
Q. That was on the theory that Lot 4 was the trackage lot?
A. Yes, sir.
Q. And that Lot 3 was not a trackage lot?
A. Yes, sir.
Q. The idea being, I take it, from what you have already said, that since the Hyland lot over on the corner of Market and Third which was listed with you and regarded worth $7,000, that you regarded Lot 4 in Block K as practically the same kind of a lot and the same value?
A. Practically so; the trackage is the valuable part of it.
2233 Q. At any rate, you compared Lot 4 in Block K with the Hyland lot?
A. Yes, sir.
Q. Since the Hyland lot had been listed with you at $7,000 therefore you said Lot 4 in Block K was worth $7,000, that is the idea?
A. Yes, sir.

Q. And then looking at Lot 3, you concluded that wasn't a trackage lot?
A. No, sir.
Q. And hence, would be worth less money?
A. Yes, sir.
Q. And something less than one half only of Lot 4?
A. Something like that, yes sir.
Q. And you regarded the trackage making that difference in the value, did you?
A. Yes, sir.
Q. I think I asked you yesterday why it was that you appraised the lots separately; why didn't you appraise Lots 3 and 4 together?
A. Well, I did appraise them together, Mr. Read.
Q. Will you explain how you appraised them together?
A. I took the two of them together and considered them worth $10,000.
Q. You considered Lot 4 worth $7,000?
A. That is the way I arrived at the conclusion; I lumped them both together.
Q. After you made a separate appraisement?
A. Yes.
Q. My inquiry is why you did not consider them for valuation purposes together?
A. I haven't any particular reason why I didn't.
Q. There wasn't any particular reason.
A. I just simply did it that way; that is all.
2234 Q. Well, let us consider a moment—the lots were held by one owner, the two lots?
A. Yes, sir.
Q. If you had held them and had been offered and been desirous of selling them it would have occurred to you, you could just as well as not divide the lots the other way and make two lots facing the railway track and why didn't you do that?
A. You would arrive at the same result.
Q. Will you explain how you would arrive at the same results?
A. I shouldn't have taken the two together and divided them up and asked the same price for both of them.
Q. The point I am getting at is this: you had in mind the Hyland lot over at Third and Market?
A. Yes, sir.
Q. Being $7,000 in value?
A. Understand Mr. Read——
Q. That was a lot 66 feet wide by 132 feet deep lying sidewise with the railroad?
A. Yes, sir.
Q. Now you could have made out of Lots 3 and 4 two lots each 66 feet wide?
A. Yes, sir.
Q. With a frontage of 66 feet on the railroad?
A. Yes, sir.
Q. Why didn't you do it for the purpose of the appraisal?

A. Wouldn't it amount to the same thing?
Q. I don't know.
A. Well, if you had taken the property in Block K, $10,000, and divided those lots up and made two lots with the 66 foot front, you have got two lots——
2235 Q. That is begging the question. Our object of the inquiry is to find out what they are worth?
A. I don't think they are worth any more cutting them up the other way.
Q. You would have had two trackage lots?
A. Yes, 66 feet in place of 132.
Q. 66 feet of frontage is sufficient to accommodate and serve the lot?
A. I suppose it is; not as much as 132 feet would be.
Q. It would have served the lot for all practical purposes and made it a trackage lot?
A. Possibly.
Q. You concede that trackage lots are worth more than nontrackage lots?
A. Certainly.
Q. You had an opportunity by that subdivision to do it, now why didn't you do it?
A. I don't understand your question.
Q. You said trackage lots were more valuable than nontrackage lots?
A. Yes, sir.
Q. You further conceded a trackage of 66 feet insufficient to serve a lot?
A. In one way; in another way it isn't.
Q. You have conceded that much; now I ask you why then, since the lots are worth more as trackage lots, why for the purpose of appraisement you didn't make two trackage lots instead of one?
A. I failed to see where you would derive any benefit from that.
Q. Will you answer my question why you didn't do it?
A. I don't know why I didn't do it.
Q. If a trackage lot in that locality is worth $7,000 and you had two trackage lots, you would have had a value of $14,000?
2236 A. No, sir; I was taking 132 feet of trackage.
Q. You insist upon the fact that you have 132 feet of trackage?
A. Yes, sir.
Q. That makes the distinction in your mind?
A. Yes, sir.
Q. You make that distinction notwithstanding you admit 66 feet of trackage is sufficient to serve a lot?
A. No, I don't think it is in all cases.
Q. Well, in this case?
A. It might be.
Q. Since it might be, why didn't you treat them that way?

Mr. BYERS: I submit that has been answered two or three times.

A. I don't know why I didn't.

Q. All right then. Now go to Lots 7 and 8 in Block C; you have placed a value of $22,000 on Lots 4, 5, 6, 7 and 8; that is right, isn't it?

A. In C?

Q. Yes.

A. Yes, sir, 4, 5, 6, 7 and 8 in C.

Q. How did you reach that aggregate, did you value the lots separately?

A. I took that on the basis of being 132 feet deep.

Q. Did you consider the lots separate and then take the aggregate?

A. No, I don't know that I did; I took that into consideration in determining the value, but I considered them as a whole.

Q. What value did you place upon Lot 7?

A. I placed two of them together in there.

Q. What value did you place upon Lot 7?

2237 A. Well, I could figure them in their entirety.

Q. Well, what did you do?

A. Well, I took it, I took the depth in there, 132 foot deep—132 feet trackage.

Q. What value did you now place upon Lot 7?

A. About $7,000.

Q. Well, now, what value did you place upon Lot 8?

A. About $3,300.00.

Q. You place that now, do you?

A. Practically so.

Q. What value do you now place on Lot 10?

A. In C?

Q. In C. I am asking for your present judgment; you do not need to consult this memorandum.

A. That is all right. I made this memorandum after I went over there.

Q. If you placed a valuation at the time of your inspection, I want that?

A. That is what I placed the valuation on the two lots.

Q. Not on Lot 10 separately?

A. No, sir.

Q. Then let the memorandum go; I am asking your present judgment of the value of Lot 10.

A. About $7,000.

Q. Did you make a separate valuation of Lot 9 at the time of your inspection?

A. No, sir; I don't believe I did.

Q. What value do you now place upon it?

A. $3,500 or $3,000.

Q. Which is it?

A. Well about $3,000.

2238 Q. Now that makes a total valuation of what?

A. I don't know.

Q. Will you add it up—I have added it up.
A. $20,500.
Q. That doesn't correspond with your—I beg your pardon, now I will go a little further with that; now what value did you place upon Lot 4 in Block C?
A. I considered the quarter block, Mr. Read.
Q. I am asking you now for your present estimate of the value of Lot 4?
A. About $2,000.
Q. What is your present estimate of the value of Lot 5?
A. About $2,500.
Q. What is your present estimate of the value of Lot 6?
A. About $5,000.
Q. Now, turn your attention to Lot 1 in Block C and state what your present valuation is of that, unless you made some separate valuation at the time of the inspection.
A. I did not.
Q. Well, what is your present valuation of Lot 1?
A. About $3,000.
Q. What is your present valuation of Lot 2?
A. $2,500.
Q. What is your present valuation of Lot 3?
A. About $2,000.
Q. Mr. Wilcoxen, the figures you have given of the separate valuation of all the lots in Block C aggregate $37,500?
A. Yes.
Q. While the valuation of the lots in Block C as testified about by you on direct examination aggregated $39,000?
2239 A. In Block C?
Q. Yes; how do you reconcile that?
Mr. BYERS: You had better check up your figures.
Mr. BRENNAN: What are your figures?
Mr. READ: $37,500 is the present valuation and the other valuation is $39,000.
A. A difference of $1,500.
Q. How do explain that discrepancy?
A. I took them as a whole, Mr. Read, and divided them up.
Q. You had a memoranda of your former valuations before you?
A. Yes, sir.
Q. Did you consider that?
A. I didn't make any division.
Q. You was looking at that as you testified?
A. That is true.
Q. Did you make a calculation as to where you were going to come out?
A. No, sir.
Q. Which valuation will you take then as your judgment?
A. I should take the first valuation $39,000.
Q. Now turn your attention to Lot 7 in Block C, you have placed upon it a valuation of $7,000.

A. Yes, sir.

Q. You did that upon the basis of a comparison with the lot on the corner of Market and Third Street?

A. Yes, sir.

Q. And upon Lot 8 Block C you now place a valuation of $3,500, and that is upon the assumption that Lot 8 is not a trackage lot?

A. Yes, sir.

Q. You admit, of course, that it was capable of division north and south?

2240 A. Yes, sir.

Q. But you didn't do that and you don't know why you didn't do it; that is the explanation you gave with respect to Lots 3 and 4 in Block K, does that apply here?

A. Yes, sir.

Q. On Lot 10 in Block C you now give a valuation of $7,000; that was also upon the basis of a comparison with the Hyland lot?

A. Yes, sir.

Q. Lot 9 in Block C you now give a valuation of $3,000; that also was upon the assumption that Lot 9 was not a trackage lot?

A. Yes, sir.

Q. You admit also that these two lots 9 and 10, in Block C, were capable of division north and south so as to make two trackage lots?

A. Yes, sir.

Q. You didn't do it and you don't know why you didn't do it?

A. No.

Q. Now going to Lot 6 in Block C, you now place a valuation upon it of $5,000; that is right, isn't it?

A. I believe so.

Q. Now, you will notice that lot is but 44 feet wide?

A. Yes, sir.

Q. Your Hyland lot on the corner of Market and Third was 66 feet wide?

A. Yes, sir.

Q. You have made a valuation of $5,000 by comparison of the width of the lot with the width of the Hyland lot?

A. Yes, sir.

Q. You don't consider the lot per front foot worth any more than the Hyland lot?

A. It has the same frontage.

Q. Will you answer my question?

2241 A. No, I don't know that I do.

Q. That lot is but one block south of Court Avenue?

A. Yes, sir.

Q. The property on Court Avenue and First you consider what value per front foot?

A. $200.

Q. What valuation per front foot do you place upon Lot 4—what does that amount to—Lot 6 in Block C?

A. Well, if you take the front feet on First Street there it would be $5,000; 44 feet—it would be a little over $100 a front foot.

Q. Your valuation per front foot on the Hyland lot is how much?

About the same price, isn't it, approximately considered, as the frontage on Third Street, 66 feet, $100 a foot; so that you- judgment is the frontage of Lot 6 on First Street is of no more value than the frontage of the Hyland lot on East Third Street?

A. I consider the trackage value.

Q. You considered their frontage is the same practically?

A. Practically so.

Q. Now the trackage is practically the same?

A. Just the same.

Q. You did not consider that the location of the lots makes any difference; that is to say, your opinion as to its value depends upon the trackage wholly?

A. To a large extent.

Q. Wholly evidently so here?

A. No, I think property that has not got trackage has got some value, Mr. Read.

Q. Well, a comparative value rests upon the fact of the identity of the trackage?

A. Yes, sir.

2242 Q. Lot 5 in Block C you value at $2,500; what is the theory of that?

A. It has not trackage.

Q. It is regarded as non-trackage property?

A. Yes, sir.

Q. And hence, the very inconsiderable value you place upon it?

A. Yes, sir.

Q. Lot 4 in Block C you value at $2,000?

A. Yes, sir.

Q. What is the theory of that valuation?

A. No trackage and further away.

Q. Further away from what?

A. From the trackage.

Q. Of course, you must concede that Lots 4 and 5 and 6 are capable of division north and south so as to make two trackage properties fronting on Vine Street?

A. Yes, sir.

Q. You didn't do that?

A. No, sir.

Q. You don't know why you didn't do it?

A. No.

Q. Lot 1 in Block C you valued at $3,000; what is the theory of that?

A. It has trackage.

Q. What is the width of the lot?

A. 44 feet.

Q. You placed a $3,000 valuation upon that lot?

A. Yes, sir.

Q. By comparison with the Hyland lot, considering that it was narrower.

A. Yes, sir.

Q. But the Hyland lot is the basis of comparison?

2243 A. Yes, sir.

Q. Lot 2 in Block C you valued at $2,500 and that I suppose is upon the theory that it is non-trackage property?

A. Yes, sir.

Q. Lot 3 you value at $2,000 and that also upon the theory that it was non-trackage property?

A. Yes, sir.

Q. You concede of course that these three lots might have been divided north and south and made about 66 feet trackage lots fronting on Market Street?

A. Yes, sir.

Q. You didn't do that?

A. No.

Q. You don't know why you didn't do it?

A. No.

Q. You will notice Lot 6 in Block C and Lot 1 in Block C are of the same width?

A. Yes, sir.

Q. And they are each trackage property according to your conception of what constitutes trackage property?

A. Yes, sir.

Q. Lot 6 you valued at $5,000 and Lot 1 at $3,000; why the difference in figures?

A. I think trackage on the Rock Island is worth more than on the K. D.

Q. Worth $2,000 more to this lot?

A. Yes, sir.

Q. Why?

A. Because I think it is a better road to be on.

Q. That is the reason for the difference?

A. Yes, sir.

2244 Q. It is not because it is farther away from Court Avenue?

A. No, sir.

Q. That you do not regard as an important circumstance?

A. It has its bearings.

Q. What bearings does it have?

A. In a general way.

Q. In a general way, how, what; can you tell?

A. No, I don't know as I can.

Q. Are you aware of the fact that the K. D. the Keokuk & Des Moines is the Rock Island?

A. No, sir.

Q. The Hyland lot is on the K. D.?

A. Yes, sir.

Q. Well, you are not aware that the K. D. is operated by and has been for a great many years, by the Rock Island?

A. It is leased by them, I believe.

Q. And is operated by them?

A. I presume so.

Q. So far as the operation service is concerned it is the same as the other?

A. I presume so.

Q. Do you want here the distinction you made with respect to the difference of being on the main line?

A. Yes, sir.

Q. Makes two thousand dollars?

A. Yes, sir.

Q. Now, according to that, why don't you add $2,000 each to Lots 7 and 6 in Block C, because they are on the main line of the Rock Island, while your Hyland lot is on the K. D.; don't you think you could afford that on your theory?

2245 A. No, I don't think so.

Q. Why do you take it off then from Lot 1 because it is on the K. D. and in that connection why don't you take it off Lot 10 in Block C because that is on the K. D.

A. Lot 10 is a wider lot than Lot 1.

Q. Yes, that is true, but it is no wider than Lot 7 in Block C.

A. No.

Q. I just want you to make what answer you care to in respect to that situation; explain yourself, if you can, or want to; if not, we will leave it as you have it.

A. Well, I don't know as I have got any explanation to make on that.

Q. Let me ask you, did you at the time of your inspection and valuation place separate valuations upon the various lots in Block B?

A. No, I don't think I did, Mr. Read.

Q. What valuation do you now place on Lot 7 in Block B, the northeast corner lot.

A. $7,000.

Q. That is upon the theory of a comparison with the Hyland lot?

A. Yes, sir.

Q. What valuation do you place upon Lot 8 in Block B?

A. About $3,500.

Q. That is upon the theory of a comparison with the Hyland lot?

A. Yes, sir.

Q. But regarding Lot 8 as a non-trackage lot.

A. Yes, sir.

Q. You concede the two lots might have been divided north and south making two 66 foot lots fronting on Market Street?

A. Yes, sir.

2246 Q. You don't know why you didn't make that division?

A. No.

Q. What valuation do you now place upon Lot 10 in Block B?

A. About $7,000.

Q. That is upon the theory of a comparison with the Hyland lot?

A. Yes, sir.

Q. Regarding it as a trackage lot?

A. Yes, sir.

Q. What value do you now place upon lot 9?

A. $3,000.

Q. That is upon the theory of a nontrackage lot and by comparison with the Hyland lot?

A. Yes, sir.

Q. That is to say, you regard Lot 9 as of $4,000 less value than the Hyland lot by reason of the fact that it is a nontrackage lot?

A. Yes, sir.

Q. These two lots might also have been divided north and south making two trackage lots?

A. Yes, sir.

Q. You didn't consider that at all and don't know why you didn't?

A. No.

Q. What valuation do you now place upon Lot 6, Block B—I want your present individual judgment without regard to any previous value placed upon it?

A. About $4,000.

Q. That is also upon the theory of a comparison with the Hyland lot?

A. Yes, sir.

Q. But regarding lot 6 as only 44 feet in width and giving it substantially the same valuation per front foot?

2247 A. Yes, sir.

Q. What valuation do you now place upon Lot 5?

A. $2500.

Q. That is upon the theory that it is nontrackage and by comparison with the Hyland lot as a basis of valuation?

A. Yes.

Q. What value do you place upon Lot 4?

A. $2,000.

Q. That upon the theory that it is a nontrackage lot and by comparison with the Hyland lot?

A. Yes, sir.

Q. What valuation do you now place on Lot 3 of Block B?

A. About $2,000.

Q. That also upon the theory that is is a nontrackage lot and by comparison with the Hyland lot valuation?

A. Yes, sir.

Q. These four lots might be divided north and south?

A. Yes, sir.

Q. Making two 66 foot lots fronting on Market Street trackage property and of a very much greater depth than the Hyland lot?

A. Yes, sir.

Q. You did not consider that in your consideration of the matter and don't know why, is that right?

A. No, I guess not.

Q. Turning your attention now to Block M did you place separate valuations upon Lots 9 and 10 in that Block?

A. I did not.

Q. What valuation do you now place upon Lot 9 in Block M?

A. $4,000.

Q. I noticed you looking at the memorandum?

2248 Mr. BRENNAN: He has a right to look at the memorandum.

A. No, sir; I was looking at the lot here on the north.

Q. That is upon the theory that it is a trackage lot?
A. Yes, sir.
Q. That is $3,000 less than the Hyland lot?
A. Yes, sir.
Q. Why—before answering that question I will ask you another one; what valuation do you now place upon Lot 10 in Block M?
A. About $3,000.
Q. You recollect that your aggregate valuation on these two lots was $7,000 given yesterday, do you?
A. Yes, sir.
Q. The valuation of $1,000 on Lot 10, Block M, is upon the theory that it is nontrackage lot?
A. Yes.
Q. Your valuation of Lot 10 in Block M, of $3,000 is upon the theory that it is a nontrackage lot?
A. Yes, sir.
Q. These two lots also might be divided north and south making two 66 foot lots fronting on Elm Street?
A. Yes, Sir.
Q. You notice the valuation of those two lots is the same as the Hyland lot?
A. I haven't added it up.
Q. You have testified that the Hyland lot was $7,000?
A. Yes, sir.
Q. You know the aggregate of $3,000 and $4,000 is $7,000?
A. Yes, sir.
Q. So that it is the same?
A. It is the same.
2249 Q. Why didn't you consider Lot 9 in Block M as of equal value with the Hyland lot; it is the same size, has trackage for the same distance and trackage on the same railroad; why that distinction—it is a mistake, it is on the Q.; Lot 9 is on the Q. while the Hyland lot is on the K. D.
A. I presume that is the reason then.
Q. Is it?
A. Yes.
Q. That is to say, two lots on the Q. are anly worth what one lot is worth on the K. D., and the difference is because one is the K. D. and the other is the Q. Railroad?
A. Yes, that is my difference, yes sir.
Q. Well, that is your view of it now?
A. Yes, sir.
Q. Another situation I call your attention to for the sake of receiving such explanation as you care to make, the Hyland lot is 66 foot lot on the K. D.?
A. Yes.
Q. Lot 10 in Block B is a 66 foot lot on the Q. railroad; you have placed the same value on Lot 10 as the assumed value of the Hyland lot; now if there is the distinction in value because a lot is on the Q. rather than upon the K. D., why don't you make it in that instance?
A. I don't know.

Q. Don't there seem to be something wrong in the working theory?
A. Mr. Read, I did not consider the Hyland lot worth $7,000.
Q. That may be true, but you used it for comparative purposes and for comparative purposes it is immaterial whether it is worth that or not.
A. Yes, sir.
2250 Q. Isn't there something wrong with your hypothesis and don't you want to recede from it and make some explanation?
A. No, sir.
Q. Very good. Now turning your attention to Block T, did you place separate valuations upon the various lots in that block at the time of your inspection of the property?
A. No, sir, I did not.
Q. What valuation do you now place upon Lot 7 in Block T?
A. About $700.
Q. What on Lot 6 ?
A. About $600.
Q. What on Lot 5?
A. About the same.
Q. What on Lot 4?
A. About $500.
Q. What on Lot 3?
A. About $400.
Q. Lot 7 is regarded by you as trackage property?
A. No, sir.
Q. It is not?
A. No, sir;
Q. None of the lots in Block T are regarded as trackage property:
A. No, sir.
Q. Lot 7 abuts upon the main line of the Rock Island Railway, doesn't it?
A. No, sir.
Q. Why not?
A. Because it is right at the end of the bridge and you can't get in there with a track.
Q. Well you regarded it as nontrackage property, all of it?
2251 A. Yes, sir; all of it.
Q. The lots are 40 feet frontage?
A. Yes, sir.
Q. The basis of comparison is still the Hyland lot?
A. Not in that case, no sir.
Q. What is the basis of comparison there?
A. What in my opinion the property is worth for factory purposes.
Q. Regarded as nontrackage property?
A. Yes, sir.
Q. And regarded as separate property?
A. Yes, sir.
Q. Not regarded in connection with the ownership of Block C or any part of Block C?
A. No, sir.

Q. Now, I believe you said yesterday that you had inspected and valued this property in groups as given by you?
A. Yes, sir.
Q. That is to say, Lots 9 and 10 in Block M in one group?
A. Yes, sir.
Q. Lots 3, 4, 5, 6, 7, 8 in Block B as in another group.
A. Yes, sir.
Q. And so on as given by you in your testimony?
A. Yes, sir.
Q. Why did you do that?
A. I don't know why I did it, but I did it that way.
Q. As I recall it some of the witnesses said they were directed or requested to make the valuations as they gave them; did you have any direction?
A. Yes, sir; that is just the way they gave them to me.
Q. Who gave them to you?
2252 A. I don't remember now who it was, whether it was the City Engineer or who it was.
Q. I would like to have your best recollection as to who gave you that direction?
A. I couldn't tell you, Mr. Read.
Q. Who did you talk to about it as to acting as an appraiser of this property?
A. I think Mr. Brennan suggested it to me first.
Q. About when was it that he first suggested it to you?
A. Oh, some two or three weeks ago; maybe longer.
Q. I wish you would think about that a moment, so as to fix the time as definitely as you can?
A. Well, I couldn't Mr. Read; some two or three weeks.
Q. The trial of this case began on the 12th day of July this year; you know that?
A. No, sir.
Q. You were in the court room along about that time, weren't you in this court room?
A. I dropped in several times, Mr. Read, I guess so.
Q. Weren't you in here in the early days of the trial?
A. I expect likely I was.
Q. Had Mr. Brennan spoken to you before that?
A. Yes, sir.
Q. How long before that?
A. I don't know a week or ten days probably.
Q. Do you recall anything about that?
A. That is the best of my recollection.
Q. Mr. Brennan was the first person who spoke to you about it?
A. I can't say; it is my impression Mr. Read.
Q. Well, who else did speak to you about it if anybody?
2253 A. I am not sure but what the city engineer spoke to me about it.
Q. Who is the city engineer?
A. Mr. Dobson.
Q. What did Dobson say to you?

A. I don't remember what was said, but they asked if I would appraise that property and I said I would.
Q. What did Mr. Brennan say?
A. He asked me to appraise the property.
Q. Did he speak to you before Dobson did?
A. I couldn't say.
Q. Were you asked to take charge of the appraisement?
A. No, sir.
Q. Did you speak to anybody else about the appraisement?
A. No, sir.
Q. Did you speak to Frank Mathis?
A. No, sir.
Q. To B. S. Walker?
A. No, sir.
Q. To Mr. Arnold?
A. No, sir.
Q. You were not in charge of the appraisement then?
A. I don't know of anybody that was particularly.
Q. Were you in charge?
A. No, sir.
Q. Weren't you in charge?
A. Not that I know of, no sir.
Q. Didn't you take upon yourself the duty and responsibility of seeing to it that the appraisers were obtained and were assembled and performed their duty?

A. No, sir; I did not. I did not know who the appraisers
2254 were until the morning we went over there. Mr. Hauge I never met in my life that I know of.

Q. Then as the matter stands you were first spoken to by the city engineer or Mr. Brennan a week or ten days before the *the* 12th of July?
A. Sometime about that; I can't remember exactly how many days.
Q. You said you had the Hyland lot listed with you?
A. Yes, sir.
Q. When was it listed with you first?
A. I think about three months ago.
Q. Listed by whom?
A. Mr. Hyland.
Q. What is his name?
A. I think it is Frank; he is with the Merchants Transfer Company.
Q. Are you willing to say you were not spoken to by some one on behalf of the City earlier than the time you have given about the appraisal of the property?
A. I couldn't say; I don't think so.
Q. Last March, say or April?

Objected to on part of defendants as irrelevant and immaterial.

A. Not that I remember of.
Q. Did Mr. Hyland come to your office to list the property?

Objected to on part of defendants as being immaterial.

A. No, sir.
Q. Did you go to see him?
A. I was up there talking about other business and he gave me that lot there.
Q. You didn't go to see about this lot?
A. No.
2255 Q. You was at his office on other business?
A. Yes, sir.
Q. And he gave you this lot?
A. Yes, sir.
Q. And fixed the price at $7,000?
A. Yes, sir.
Q. You put it on your books?
A. Yes, sir.
Q. Did you make an entry in writing?
A. No, sir.
Q. Just carried it in your head?
A. I took a written memoranda on it.
Q. Have you got that memorandum now?
A. I have not.
Q. Is it in your office?
A. No, sir.
Q. Do you know where it is?
A. I don't know where it is; it may be up at the house.
Q. Now, returning to the question of the property, you appraised it in groups?
A. Yes, sir.
Q. A piece of property that is adapted to some particular use as a whole is of greater value and worth more than when cut up into pieces, isn't it, as a general rule at least?
A. Sometimes that is true and sometimes it is not.
Q. A piece of land adapted for stock growing, because of having a stream of water running through it or running through one forty of it, taken as a whole, adapted for stock raising and stock growing purposes, would be worth more considered as a whole than if it were divided up and the stream of water segregated and cut
2256 off into one fractional part?
A. Most assuredly.
Q. And a piece of property that as a whole is served by railway trackage is worth more if taken as a whole than if the trackage is segregated by setting off and attaching it to separate fractional parts?
A. Well, I think that depends.
Q. You wouldn't admit that proposition?
A. If a man wanted to use all of it, that would be true.
Q. The general proposition is true, Mr. Wilcoxen, isn't it?
A. What do you mean, Mr. Read, as regards to a block?
Q. I mean just as I stated it in the question, that property as a whole considered as trackage property is worth more than if the trackage be segregated and out off and attached to a fractional part of it and the remainder of the property rendered non trackage.
A. Yes sir.

Q. Now this property over here of the Gas Company is used by the Gas Company as a whole, isn't it?

A. I presume so, yes sir.

Q. You know so?

A. Yes,—well on Block T I don't think they are using all of that.

Q. You don't know what that is used for in the property of the gas plant?

A. I see they have got a pump or something in there.

Q. That is all you know there?

A. Yes.

Q. You know that because you saw the pump?

A. Yes, sir.

Q. But you don't know what appliances may be in there
2257 in the economy of the gas plant?

A. No.

Q. So now, if you can tolerate the idea that Lot 10 is used in connection with the other property, then the whole of it is used in connection with the management and conduct and operation of the gas plant?

A. Yes, sir.

Q. And the property as a whole for that use is worth more, isn't it, than if you cut it up into smaller fractions, especially than if you segregate the trackage off the property?

A. For their use, yes sir.

Q. You admit the proposition that property is worth what it is worth for its highest available use?

A. I expect that is correct.

Q. That sounds like a good proposition?

A. Yes.

Q. You have not, of course, apparently undertaken to value the property of the gas plant for what it is worth for its highest available use, assuming that the purpose for which it is now used is its highest available use?

A. No.

Q. You apparently at least have undertaken to value it upon the theory, upon the basis, of cutting it up into small fractions and of rendering a part of it nontrackage property, haven't you?

A. Yes, sir.

Q. It is worth more as trackage property than it would be without it?

A. Yes, sir.

Q. And when you say that in your opinion the aggregate value which you have given is the true, reasonable present market value, you mean necessarily the market value in your opinion as
2258 cut up and segregated as you done it?

A. Yes, sir.

Q. You don't mean its present market value for such use as it is now devoted to and you don't mean that that tract of ground if it were occupied and used as other ground over in that vicinity is used, such as the property of the Des Moines Manufacturing & Supply Company, the American Linseed Oil Company, the Nicholas Shedherd Co., could be obtained at the prices you fixed?

A. I think they could be obtained at the prices I have given you.
Q. But if the property of the Gas Company were devoted to such use as the other properties I have called your attention to, do you think they could then be obtained for the price you have given?
A. Not in that locality, no.
Q. You don't think so?
A. Not in that locality.

Excused.

F. A. MATHIS, being first duly sworn on part of defendants, examined in chief by R. O. Brennan, Esq., testified:

Q. Where do you reside?
A. In Des Moines.
Q. How long have you lived in Des Moines?
A. Since 1882.
2259 Q. And what has been your business?
A. Since about 1884 I have been in the real estate business most of the time in East Des Moines.
Q. What is the name of your firm?
A. Mathis Realty Company.
Q. Have you devoted yourself excusively to the real estate business?
A. Yes, sir.
Q. Are you familiar with real estate values in the city of Des Moines in a general way?
A. Yes, sir; in East Des Moines especially.
Q. Do you know the property of the Des Moines Gas Company?
A. Yes, sir.
Q. Did you investigate that property at any time for the purpose of placing a valuation upon it, Mr. Mathis?
A. Yes, sir.
Q. And at whose instance and request?
A. At the instance of yourself and the Mayor.
Q. Did anyone else at any time request you to?
A. Yes, sir.
Q. Who was that?
A. Mr. Keffer of the Gas Company.
Q. W. D. Keffer, of the Des Moines Gas Company?
A. Yes, sir.
Q. He asked you at one time to place a valuation on it?
A. Yes, sir.
Q. When was that, Mr. Mathis?
A. It was probably in late winter or early spring, I have forgotton; some seven or eight months ago.
Q. You are familiar with the property of the gas Company, are you Mr. Mathis?
2260 A. Yes, sir.
Q. And know the property in that vicinity as well?
A. Yes.
Q. And kept touch with the sales over in that part of the city?
A. Tried to, yes sir.

Q. Directing your attention to the plat before you, Exhibit 5, blue print showing the location of the Gas Company's property, I wish Mr. Mathis you would refer to Lots 9 and 10 in Block M shown on the plat and tell the Master what in your judgment was the reasonable market value of those lots say on or about January 1st, 1911?

A. I put a value on that of $65 a front foot fronting to the railroad.

Q. What would be the aggregate valuation of the two lots?

A. $8,580.

Q. Is that Block M or Block B?

A. I think I placed the value in Block M at $60.

Q. I want to get Block M first, what was the frontage?

A. 132 feet square.

Q. At $60 a front foot it would be $7,920?

A. Yes, sir.

Q. Is that what you would say, Mr. Mathis, would be the reasonable market value of the two lots?

A. Yes, sir.

Q. Now take Lots 9 and 10 in Block B, shown on Exhibit 5, and tell the Master what the reasonable market value of those lots was on January 1, 1911?

A. I put those at $65. a front foot.

Q. $65. a front foot?

A. Yes, that would be $8,580.

Q. Now, referring to Lots 3, 4, 5, 6, 7, and 8 in Block B,
2261 please tell the Master what in your judgment was the reasonable market value of these lots at the time referred to?

A. I put those and 7 and 8 together and appraised them on the basis of $75 fronting to the north.

Q. What is the aggregate?

A. $19,800.

Q. Referring to Lots 1, 2, 3, 9 and 10 in Block C, Mr. Mathis, will you please state what in your judgment was the reasonable market value of those lots at the time referred to?

A. I put that at $80 a front foot.

Q. What is the aggregate amount?

A. $21,120.

Q. What are the dimensions?

A. 264 feet. They are marked on this plat 140 feet; I have figured it on the basis of 132 feet; that would be 280 feet. That would also be true with these others. I had taken the city plat. This plat shows 140 and the city plat shows 132.

The MASTER: Which ones are those?

A. Both blocks B and C; that is on account of the alley.

Q. You took the city plat which showed the alley?

A. Yes, on a basis of 132 feet deep.

Q. On the basis of 264 feet, I just wanted to know if you had not made a mistake in your multiplication?

A. I make it $21,120.

Q. Now taking lots 4, 5, 6, 7, and 8 in Block C?

A. I put those at $100 a front foot on the Rock Island.
Q. What is the aggregate?
A. That would be $26,400.
Q. On the basis of eliminating the alley?
A. Yes, $26,400.
2262 Q. Referring to Lots 3 and 4 in Block K, tell the Master what in your judgment is the value of those lots.
A. $100 a front foot.
Q. What is the aggregate?
A. $13,200.
Q. Now, referring to lots 3, 4, 5, and 7 in Block T shown upon the plat, tell the Master what the value of the lots to which your attention is called was on January 1, 1911?
A. I appraised that at $4,000.
Q. So that if I have added your figures correctly the total value of the property is $101,020.
A. I haven't got it totaled here.
Q. Your figures are, as I have them, $7,920; $8,580; $19,800; $21,120; $26,400; $13,200 and $4,000?
A. That is $101,020.
Q. Now, Mr. Mathis, is that your judgment of the market value of this property on or about January 1, 1911?
A. Yes, sir.
Q. I wish you would tell the Master which is the principal thoroughfare in East Des Moines, business street?
A. Walnut and Locust Streets.
Q. Are property values higher on Locust than on Walnut?
A. Yes, sir.
The MASTER: Locust Street runs to the Capitol?
A. Yes, sir.

Cross-examination by W. L. READ, Esq.:

Q. Who was present when you inspected and examined this property?
A. B. S. Walker, A. O. Hauge, Mr. Arnold and Mr. Linthicum.
2263 Q. Did Mr. Wilcoxen refer to the lot on the corner of Third and Market known as the Hyland lot?
A. He did some time during that time, I think the latter part, after we probably had looked at the property.
Q. Did he tell you that lot was listed with him at $7,000?
A. Yes, sir.
Q. Did he tell you about another lot over on Raccoon Street?
A. No, sir.
Q. Just the one lot, the Hyland lot?
A. Yes, sir; I think he told me about a lot on Raccoon Street after that one time, but not at that time.
Q. Did he tell you about the Raccoon Street lot before you had reached your conclusion as to the appraisal?
A. No, sir.

Q. About the Hyland lot he told you the day you were down there?

A. Yes, sir.

Q. He told you that lot was listed with him at $7,000?

A. Yes, sir.

Q. Why have you appraised this property in lots as you have given it?

A. I didn't see any other way to arrive at any conclusion as to its value.

Q. It was upon your own suggestion then?

A. Yes, sir.

Q. Mr. Mathis, it is a coincidence perhaps, but Mr. Arnold, Mr. Wilcoxen and Mr. Hauge and Mr. Walker have, as I recall it, given appraisements in this method, that is, by including the same lots in the same block; did you talk it over and agree upon it?

2264 A. I made this appraisement for Mr. Keffer first six or eight months ago on this basis.

Q. Did you talk with Mr. Wilcoxen, Mr. Arnold and the rest of the appraisers of this method of getting at it?

A. I think I suggested—I don't know whether I suggested it or somebody else; I suggested that I had already made an appraisal I think, and I may have suggested that it was appraised that way; I don't remember.

Q. As I recall it, some of the witnesses stated that they had been requested to appraise in this method, that is in lots?

A. Not that I know of; I did not understand we were.

Q. At any rate, you and all the appraisers for the city seem to have appraised in this method and including the same lots in the same bunch?

A. Well, I don't know; I can tell you that I made this appraisement for Mr. Keffer several months before I ever talked with the other gentlemen.

Q. Mr. Mathis, if you will pardon me, I did not inquire about that; I am trying now to find out how you appraisers all adopted the method of appraisement by lots?

A. I only can explain for myself.

Q. Do you think you told the others you had appraised it in that way?

A. I think so.

Q. Did you suggest then that was the better way?

A. I may have done so; I don't remember.

Q. You don't recall?

A. No.

Q. You just stated a moment ago you could see no other way to appraise it?

A. I think we could get at its best value by appraising it on railroad frontage.

2265 Q. Were you in the court room when Mr. Wilcoxen testified?

A. Part of the time.

Q. Let me ask you, how you did appraise, for instance take Lot- 9 and 10 in Block M?

A. I appraised it on the basis of the railroad frontage.

Q. You appraised the two lots together?

A. Yes, sir.

Q. And on the basis of railroad frontage?

A. Yes, sir.

Q. What was your basis of comparison as to those values?

A. Well I commenced on the Rock Island trackage first and appraised that $100 a front foot.

Q. What did you begin with first?

A. I appraised the Rock Island trackage first.

Q. Let us get the job lot you first appraised?

A. Lots 4, 5, 6, 7, and 8 in C.

Q. Now you appraised that upon the basis of Rock Island frontage?

A. Yes, sir.

Q. What did you first appraise?

A. 4, 5, 6, 7 and 8 in C.

Q. Did you consider Lots 4, 5, and 6 as trackage property?

A. Yes, sir.

Q. You took 132 feet frontage on the Rock Island?

A. Yes, sir.

Q. And called that $100 a front foot?

A. I took the whole block and called it $100.

Q. That is true of those three lots at any rate?

A. Yes, sir.

Q. What was the basis of comparison to obtain that $100 per front foot?

A. Well, at that time there hadn't been any sales I knew
2266 of in that exact locality, that is any recent sales.

Q. The Hyland lot was listed with Mr. Wilcoxan, he told you that?

A. Not when I fixed this value.

Q. He told you that anyhow?

A. I fixed this value some months before I talked to Mr. Wilcoxen about the Hyland lot.

Q. Go ahead and tell me how you obtained the basis of comparison?

A. I simply had to take into consideration the values as to what I believed they were worth in that locality; since then there have been some sales in that locality which I think justify my——

Q. Just precisely how did you arrive at your conclusion of $100 a front foot being the proper valuation?

A. Well, there was trackage on Court Avenue on a public street at that time——

Q. What trackage was that?

A. Between Second and Third on the south side of Court Avenue; at that time we could offer at $200 a front foot; I considered it was worth twice as much as this on the Rock Island.

Q. Why?

A. Because of the fact it had frontage on a public street and had streets all around it.

Q. Vine Street is a public street?

A. It is a railroad track.

Q. It is a public street?

A. It belongs to the city I guess.

Q. It has not been vacated?

A. Not that I know of.

Q. Then the difference was, because of your estimate, the difference between Court Avenue and Vine street as a street?

2267 A. To a certain extent.

Q. What trackage does that property have?

A. The Des Moines Union.

Q. It is served by a track through the middle of the block?

A. Back of the frontage.

Q. What property was that?

A. The Patrick property.

Q. Did Patrick offer his property?

A. He was offering it at that time.

Q. At $200 a front foot?

A. Yes, sir.

Q. What other factor entered into the formation of your judgment of $100?

A. The Baylor property of First and Court Avenue was held or had been sold, I don't remember which; at that time it was held at $28,000 and I think sold for $27,000.

Q. About $200 a front foot?

A. I don't remember now. A little less than $220.

Q. The Baylor property is not trackage property?

A. No, sir; that was a corner property near the river and right by the bridge.

Q. It was not trackage property.

A. No.

Q. What other circumstance or fact did you have in mind in reaching your conclusion as to the valuation per front foot of the gas property in Block C?

A. Well the Nicholas Shepherd property on the corner of Fourth and Vine was bought by the Loetcher-Yeager Manufacturing Company for $35,000 a quarter block with a three story building on it.

Q. That is trackage property?

2268 A. Yes, sir; that is on the Northwestern, the Rock Island and the Des Moines Union.

Q. That was unusually cheap property, wasn't it, a low price?

A. I think it was a good buy; I think it was a little below its value.

Q. It was really below normal?

A. I think so.

Q. In your estimation?

A. Yes, sir.

Q. You are rather conservative, aren't you?

A. I hope so; I think I am.
Q. You take some pride in the fact that you are conservative?
A. I don't know that I take any pride in that fact.
Q. You recognize it as a fact that you are conservative?
A. Yes.
Q. Was there anything else now that was a factor?
A. There was a sale on the corner of Third and Vine by the American Linseed Company to the Loetcher-Yeager people of a quarter block of $8,000.
Q. When was that sale?
A. That was this spring; it was consummated in March; it was made earlier than that.
Q. That was regarded by you as a low price?
A. I think it was a low price.
Q. It was a bargain counter sale?
A. I don't know whether—I don't think they were forced to sell it; but I think they sold it at a low price.
Q. Anything else?
A. There was a lot of the Iowa Loan & Trust Company on Fourth street between the K. D. and the Rock Island, on the east side of the street sold for $2,500; 60 feet, not trackage.
2269 Q. That was a lot the Company had taken on foreclosure?
A. I don't know how they got it.
Q. The Iowa Loan & Trust Company is not a holder of property at all, not a buyer?
A. I think not.
Q. It simply takes what it has to on foreclosure?
A. I think so.
Q. From those circumstances you concluded the frontage in Block C was worth $100?
A. Yes, sir.
Q. What did you do with Lot 9, the remaining lots in that block?
A. I put them out fronting on the K. D. at $20 less.
Q. Why did you do that?
A. From the fact they are a little farther away from the crossing of the bridge, crossing of the river, and because of the fact they were on the K. D. instead of a through line.
Q. And the properties in Block D you considered all as trackage property?
A. Yes, sir.
Q. And so placed a valuation upon them making it less per front foot because of what circumstance?
A. Well, it is a little farther from the crossing of the river.
Q. What figure does that short distance cut in your estimation?
A. Well it would be a very ha-d thing to explain, but sometimes property in one block is worth a little more than any other if the streets are open.
Q. In your estimation in Block B, K. D. frontage, you put it at how much?
A. I put the Rock Island frontage that is the K. D. at $80—no in Block B I put that at $75.

2270 Q. The Q frontage, what is that?

A. That is $65 in Block B.

Q. Why did you make that difference?

A. Because of the difference in railroads and the difference in location as compared with crossing the river bridge further from the bridge.

Q. You made $35 difference per front foot between property in Block B fronting on the Q. and Block C fronting on the Rock Island?

A. Yes, sir.

Q. You made it because of the difference in the two railways and because of the difference in the distance from the bridge?

A. Yes, sir; and the location as to the business property in East Des Moines also.

Q. This isn't business property?

A. No, this would be manufacturing property, factory property.

Q. How much difference did you make because of the two railroads?

A. I don't think I could tell you. In the sale of property we find——

Q. Have you——

Mr. BRENNAN: Let him finish his answer.

A. In the sale of property we find that Rock Island trackage is much preferable to the Q. or K. D.

Q. Have you sold any?

A. Not recently.

Q. Have you ever?

A. I have sold some trackage, yes sir.

Q. Have you had an opportunity to know the circumstance you call attention to, and to see whether it is true or not as to whether it is on the Rock Island or Q.?

A. I don't know that we have sold any but in offering property we find that distinction.

2271 Q. When did you find it and where; I am disposed to doubt that proposition and defend the Q. railroad.

A. I don't know that I can tell you, Mr. Read.

Q. The property in Block T, what did you regard it, for what uses did you regard that property as available?

A. I thought it might be available for small factories.

Q. Did you regard it as having trackage facilities?

A. Yes, sir.

Q. But you didn't value it according to the frontage?

A. I valued it because of the fact that it was so much deeper than it was fronting on the railroad track, taking into consideration the fact it had trackage.

Q. You didn't regard it as a part of the Gas Company property, used and essential to use in connection with the maintenance and operation of the gas plant?

A. No, I think not.

Q. You didn't regard any portion or any lot that you separately appraised as an integral portion of the gas plant?

—. No, sir.

Q. Or necessary to its operation?

A. No, sir.

Q. Where it is necessary to have a certain tract of land, I mean a certain area, to serve the purpose for which it is desired, that property so necessary is worth more consequently than it is cut up and separate?

A. It might bring more if they had to have it just in that location.

Q. Well it is worth more in that location?

A. If they had to buy it in that location and pick it up in small parcels——

Q. It is worth more in that location because if the then owner were to sell, if there should come along a buyer who wanted
2272 the same tract or an equal tract of equal area, it would be worth more to him?

A. I think it would bring more money split up than in a tract.

Q. Take my proposition, that piece of ground, that whole tract, if a person should come along who wanted a tract of equal area and equal character of trackage and all, it would be worth more to him, he would pay more for it as a whole than he would if it was in separate tracts?

A. Usually in buying large tracts of that kind they want to buy it cheaper.

Q. Take this illustration: suppose one had a piece of agricultural land adapted for stock growing and watered by a running stream, now if a person wanted to buy a stock farm he would pay more for that farm as a whole than he would if it were cut up into forty acre tracts seggregating into one forty all the water?

A. That individual man might.

Q. People of that class would?

A. Yes.

Q. So that applied, that illustration applied to the situation over here, here is a tract of land adapted for a use where trackage facilities were necessary, where it was necessary and desirable to be inside and not remote from the business center, and where it was desirable and advantageous to be near to the thoroughfares of the business, now such property as a whole would be worth more than if it were cut up into separate properties?

A. It usually brings more money cut up into small parcels.

Q. That might be true of business property, but that could not be true where a demand was for a large tract—I am trying to get into your mind now the idea of a demand for a large tract, a tract
2273 as large as this?

A. It is pretty hard to answer that question as you put it. Usually if they can't get one location that suits when they want a large tract, they go to a location where they can get it.

Q. This is a problem of having it in this location?

Mr. BRENNAN: I submit the witness has answered the question two or three times.

A. I am inclined to think Mr. Read, the property would bring more money split up in parcels than a large buyer would pay for it as a whole.

Q. Suppose you had the problem on hand of buying up in one tract two and a half blocks or two and three fourth- blocks in that general locality, for instance, south of Court Avenue and west of Fifth Street and north of Elm, what could you go in there, what would it cost to go in there, taking that location as it is, the uses that are made of it and gather up two and a half blocks of contiguous property?

A. I don't think it could be done.

Q. Why?

A. Because of the fact that the Gas Company and the railroad companies have got most of it.

Q. There are a good many factories in there?

A. Small factories, yes sir; quarter blocks. It is hard to get into one block where a railroad company hasn't got a part of it.

Q. Well, take block D and Block I, the Des Moines Union goes through that block, but eliminating that, what could you get those two blocks for?

A. I don't know whether they could be bought or not.

Q. I wish you would take a pencil and figure out what the cost would be?

A. I can't do it, because I don't know what the owners want for it.

2274 Q. You know what they are worth?

A. Court Avenue frontage would be worth $200 here.

Q. Mr. Mathis, it would cost more to get those two blocks than the valuation you placed upon Blocks C and B?

A. Yes, sir.

Q. Doubly more?

A. I don't know whether doubly more but it would cost more.

Q. Now, suppose you would go on the west side of the river, south of Mulberry and east of Twelfth and Fifteenth and north of Tuttle and undertake to buy up two blocks and a half there——

A. I haven't any idea what it would cost there, I haven't handled anything there.

Q. Suppose you were to gather up two blocks and a half, using the Kraetzer Carriage Company as a nucleus, what would it cost there? Can you state what it would cost there?

A. No, sir.

Q. Well, return to the east side then, it would cost a sum considerable in excess of the valuation you placed upon the gas property to gather up under one ownership an equal area of ground in the district I have called attention to?

A. I think so.

Q. Now, Mr. Mathis I want you to get into your mind the idea of a buyer who desires two blocks or two blocks and three quarters

of ground, situated west of Fifth Street and south of the south line of Court Avenue and north of Elm Street, who requires that the property shall be trackage property, thoroughly trackage and in that general location; now suppose that you had the property of the Gas Company, what price do you imagine you would make to that buyer for the gas property, remembering and keeping in mind the conditions as they prevail in Des Moines, the inside trackage property in West Des Moines and inside trackage property in East Des Moines is high priced?

2275

Objected to on part of defendants as incompetent and not proper cross-examination.

A. That would depend very largely on what I thought I might be able to get for it; I would get all I could for it.

Q. That is true; wouldn't you sit down and figure for yourself—this man requires this large tract of ground, it has got to be trackage property, he can't get it in the outside trackage districts, he must get it in here; he can't get it in West Des Moines and buy an equal area without paying a half a million dollars as a rule, and he cannot well go into this district because he has got to buy up from individual owners and he will be held up along the line; wouldn't you figure all these things as factors in determining what you ought to ask for it.

Defendants interpose same objection las- made.

A. In selling I would try to get as much as I could; if I figured he was going to be held up by somebody else, I would try to hold him up myself.

Q. Wouldn't you figure all the elements, factors to which I have called your attention in fixing the price that you ought to ask for your two and three fourths blocks of ground?

A. I perhaps would.

Q. Wouldn't you be right in doing that, aren't they just the factors to be taken into consideration?

A. Those are taken into consideration.

The MASTER: You would sell it for all you could?

A. Men usually get all they can.

Q. Aren't those just factors to be considered by you and wouldn't you justly argue that the man you was trying to hold up would look at it in the same way, isn't that true? 2276

A. I suppose I would insist upon getting as much as I could for the property.

Q. You recognize that supply and demand are vital elements in determining values?

A. Yes, sir.

Q. If you had the only available piece of ground several people wanted you would think you could get more for it?

A. Yes, sir.

Q. What is the range of values on East Locust Street from First to Fourth street, referring now to ground irrespective of improvements?

A. From $175 to $200.

Q. Do not limit yourself to what may be offered for it; I am simply asking what is a just value rather than price?

A. About $200 a front foot.

Q. Where do you find $200 a front foot property?

A. We sold some near Fourth Street just east of Fourth Street last year for $3,500, 20 feet, that would be less than $200.

Q. The Shaver property, what do you think that is worth a front foot—you had a chance to testify about that and put it down low; see how low you go again.

A. I was not a witness in the Shaver case.

Q. What is it worth?

A. That is a corner—is it 44 feet?

Q. I think so?

A. About $250.

Q. Go one block east to the corner of Fifth and Locust; what is property worth there per front foot?

2277 A. Probably $300 to $400.

Q. Well, let's take the corner that Teachout has bought, the northeast corner of Fifth & Locust, what valuation would you place upon that ground; in that same connection what valuation would you place upon the southeast corner of the Smucker & Loper property, and in that same connection the Capital City Bank property?

A. I think the Teachout corner worth about $400 a front foot.

Q. What did he pay for it?

A. $110,000 I think.

Q. How much?

A. 100 feet.

Q. The building and all?

A. Yes.

Q. How deep?

A. 132 feet.

Q. The building is old, it isn't worth much?

A. Part of it is old and part isn't.

Q. Well take the Capital City Bank corner, how much is that ground worth?

A. About the same, about $400 a front foot.

Q. And the Smucker & Loper frontage?

A. About the same basis.

Q. And the other corner?

A. About the same.

Q. Where is the highest priced property frontage in East Des Moines?

A. On Locust Street between Fifth and Sixth.

The MASTER: What is the next street south of Walnut?

A. Court Avenue.

Q. What is your idea for placing so low a valuation on the Teachout property?

2278 A. There is a good building there excepting just on the corner.

Q. Teachout bought it recently?
A. Yes, sir.
Q. When?
A. Something over a year ago.
Q. Paid $100,000?
A. Yes, sir.
Q. You figure the building worth $50,000?
A. Around there someplace; about $60,000.
Q. He didn't pay too much for the property, did he?
A. I think not.
Q. Smucker & Loper have an asking price?
A. I don't know whether it is offered or not.
Q. Don't you know they are holding it at $35,000?
A. No, I do not.
Q. Do you know what the bank values its property at?
A. No, sir.
Q. When you get down west of Fourth Street it is about $150 to $200 per front foot?
A. Yes, sir.
Q. You know that the city bought a site for the city hall?
A. Yes, sir.
Q. And paid $78,000?
A. I don't know what the price was.
Q. About 100 feet frontage on Locust street and about the same frontage on Grand Avenue?
A. I don't know what the frontage is.
Q. That would be about $390 a front foot, double frontage on Grand and Locust?
A. Something like that.
2279 Q. How has property sold on Locust street east of that on the corner of East First and Locust?
A. There has been nothing sold but some condemned by the city.
Q. The holding prices are from $500 to $600 per front foot, aren't they?
A. I don't know anything except the corner of First which has been held I think for something like $15,000 for 60 feet.
Q. Since the city hall was located at the present site and since the new Locust street bridge has been completed and since the *the* grade of Locust street has been raised and since the park improvement commenced on the river front there have been a good advance in prices of property over there?
A. Yes, sir.
Q. How much?
A. About double.
Q. That is pretty nearly equally true of Walnut street east from the bridge to Fourth street?
A. Yes.
Q. There has been an advance on Court Avenue?
A. Yes, sir.
Q. About equally?
A. Yes, sir.

Q. The recently projected improvements in the way of a contemplated track through there has also tended to increase the prices?

A. I think perhaps so.

Q. So that for the last two or three years there has been a market and decided upward tendency in prices?

A. Yes, sir.

Q. There have not been many sales on those streets because of the people holding the prices anticipatory?

2280 A. Yes, sir.

Q. Therefore you find it difficult in finding a basis of values, don't you?

A. Well, I guess that is true, yes sir.

Q. You have not been able to adjust your mind and judgment to the advance in prices?

A. I think I have; I think they have about doubled in the last four or five years.

Q. That is to say, property worth $150 now on Locust Street three or four years ago was worth $75.

A. I think so.

Q. What property did you have in mind?

A. I didn't quote any property so low.

Q. At $200?

A. Property west of Shaver's sold something like three years and a half ago for $100 a front foot.

Q. What would it sell for now?

A. It has got buildings on it now; the ground would probably sell for $225.

Q. There are no properties offered for sale along that street?

A. Not very much.

Q. You know where the Bolton property is?

A. Yes, sir, some of it.

Q. Are the range of values on Walnut Street about the same as Locust street?

A. Yes, sir.

Q. How do the values on Court Avenue from the river east compare with Walnut street?

A. Probably a little lower.

Q. But all with the market of an upward tendency?

A. Yes, sir.

2281 Q. The owners are expecting to have advances?

A. Yes, sir.

Q. And so far as you are able to see they will come, too?

A. I think so.

Q. Your judgment is there will be a continuous advance in prices?

Objected to as being incompetent.

A. Yes, sir.

Redirect examination by Mr. BRENNAN:

Q. Mr. Mathis, who is W. D. Keffer for whom you made the appraisement in the first instance?

A. He is connected with the Gas Company.
Q. As Secretary?
A. Yes.

Mr. READ: That is not a very proper subject of inquiry. The witness volunteered that; evidently if he did make one it was so extremely conservative that nobody would look at it.

Q. Were there any criticisms directed against it by any one or any witness testifying against it?
A. Mr. Keffer objected and said it was too low; he said he couldn't use it.
Q. Did anybody else say anything about it?
A. Connected with the Gas Company?
Q. Yes, or who testified here on their behalf.
A. I talked to Mr. Porter one time in connection with it.
Q. What did he have to say?

Objected to on part of complainants as immaterial and hearsay.

2282 A. Mr. Porter said he had been asked by the Gas Company to make an appraisement and he wanted to get my idea about its value; he was looking it up some. I told him I had already given Mr. Keffer a figure. Mr. Porter took my figures and talked about them. He said he thought I had it too high.

Recross-examination by Mr. READ:

Q. You talked with Mr. Keffer some last winter?
A. Early winter.
Q. Don't you know Mr. Keffer has been ill and away from town since January last winter?
A. I am not sure about the date; if I was I would fix it.
Q. You said the latter part of the winter?
A. Well, to a certain extent it is a guess.
Q. It was before the coming of spring, wasn't it?
A. I think so.
Q. In the winter?
A. I think it was probably along in the winter.
Q. You know as a matter of general information that Mr. Keffer has been sick and was sick and is away and has been away?
A. I don't know anything about that; I haven't seen him.

Excused.

2283 WILLIAM D. MARKS, being first duly sworn, examined in chief by R. O. Brennan, Esq., testified:
Q. Where do you reside?
A. I do business in New York City.
Q. What is your profession?
A. Consulting Engineer.
Q. What preliminary or technical training have you had Professor to qualify yourself as consulting engineer?
A. I was graduated from the Yale School of Science in 1870, and

in 1871 took an additional degree in civil engineering. Since that time I have either been in actual practice or in instructor in engineering.

Q. Did you pursue any studies abroad in connection with your profession?

A. I spent the better part of a year in special studies on bridge construction abroad.

Q. You say that you have taught engineering, tell the Master in what schools you have been instructor.

A. In 1876 I was appointed instructor of mechanical engineering in Lehigh University; after serving there for a few months I was made Professor of Dynamical Engineering in the University of Pennsylvania, serving from 1876 to 1887.

Q. Please state in general and somewhat in detail what has been the character and nature of the professional work which you have been doing during your experience as consulting engineer?

A. By degrees I have become a specialist in gas and electricity. In 1871 I was assistant division engineer for the Delaware & Lackawanna Railroad and then later became transit man on the Chicago & Northwestern Railroad; in 1872 I was appointed resident
2284 engineer and accountant for the contractors building the La Clede Gas Works in St. Louis. I was with them from the beginning of the work until completed and in operation for some little time. After that I became contractor for blast furnaces, blast engines and railway locomotives and railway machinery. That occupation lasted until 1876. In 1887 I got a leave of absence from the University to design a ten thousand horse power electric light station built in Philadelphia, and did so design it, erect it and operate it until 1896. During the most of the latter part of the operation of this station I was the president and in 1896 I resigned the presidency to again become consulting engineer.

Q. So that from 1876 to 1887, I understand you, your activities were devoted to teaching in the University of Pennsylvania?

A. Yes.

At this time an adjournment was taken until 1:30 P. M.

2285 1:30 P. M., TUESDAY, *August* 15, 1911.

WILLIAM D. MARKS being continued on direct examination by R. O. Brennan, Esq., testified as follows:

Q. Now Prof. Marks, I think just before we took the noon adjournment you were stating in a general way your early experiences and also the time which you devoted to teaching in the University of Pennsylvania. After the year 1896 when you resigned as president of the Electric Light Company in Philadelphia, just what was the character of the work which you took up and what did you do during the years after 1896?

A. From 1896 on I was engaged in electric railway, in electric light works, and in gas works. Dropping the question of electricity I during that period, between that and 1905, when I went to New York—I was then located in Philadelphia—I built the Durham,

North Carolina, Gas works, a town of about 22,000 inhabitants and I took up the incomplete gas and electric light works at Fostoria, Ohio, and completed the gas works. That was all the distinctively gas business that I did except an occasional report. I should have told you that during the period between 1876 and 1887, I was actively employed in nearly all of my leisure time by the president of the Brooklyn Gas Light Co., and his associates in investigating gas works in which they were interested acting not only as a technical trained engineer in gas matters but also as accountant and going over their works, examining them as an engineer and sometimes going into their books as an accountant for the purpose of advising them as to the economics of their operations and as to the possibility of their future.

2286 Q. You spoke about going to New York City in 1905. What was the nature of the work in New York City at that time?

A. I was called from Philadelphia by the corporation counsel of New York City and entered into an agreement with him to render exclusive services if necessary, that is all of my time if necessary for three years. I began about the beginning of 1906 and continuously toiled until the beginning of 1909 in the service of New York City on the various suits, or more particularly the suit of the Consolidated Gas Co., against Wilcox as it was afterwards called although Mr. Wilcox had nothing to do with it at all had no connection with it.

Q. You refer to the case of Wilcox against the Consolidated Gas Co.?

A. Yes, sir.

Q. A case in the supreme court of the United States?

A. On the appeal of Wilcox *vs* the Supreme court of the United States.

Q. What was the nature of the work which you performed for the city of New York in reference to that case?

A. That of a technical expert in *g*as matters, more particularly appraising and accounting so far as the operating expenses were concerned.

Q. About how many gas works were involved in that investigation?

A. There were six manufacturing gas works on the island of Manhattan and four sub-gas works or distributing stations all of which I was compelled to appraise. I ought to explain to you when I say that there were a number of appraisements made, but that there was no definite classified appraisement made by any person except myself. The appraisement made for the Consolidated Gas Co. was given in the form of oral evidence entirely and in a very disconnected form in response to questions. The only classified written ap-

2287 praisement was made by myself.

Q. Did you perform any service for any other cities in the United States and if so please state what cities?

A. In the city of Buffalo I was called upon to appraise gas works there and as all information was refused had not only to make out the list, but also to look up all of the details and appraise their

throughout. There were there four gas works, two of them had been entirely abandoned, one of them was a coal gas works and the other was a water gas works which they were not allowed to use on account of the supposed -oisonous qualities of the carburetted water gas.

Q. Did you perform any services in Jersey City?

A. In Jersey City I was called upon to appraise the gas works there that belonged to the public service corporation of New Jersey, just before I came out here. I forgot to mention that I also appraised three gas works in Cleveland, Ohio. In that case it was necessary for me to make all of the drawings and a complete set of drawings and then go over the works and appraise not only the active large gas works of about a billion and a half yearly capacity, but also two gas works which had been recently abandoned on account of the inroads of natural gas. I appraised the Bronx Gas & Electric Light Company works in the northern end of the Island of Manhattan for the corporation counsel, I had forgotten that. That makes eleven there.

Q. Have you performed any services for the city of Minneapolis?

A. I was employed by the city of Minneapolis in the autumn of 1909, if I recall correctly for the purpose of advising them on technical matters connected with gas and for the purpose, as all information was refused of making an estimate of the value of the gas works under an appraisal and fixing the price of gas, the reasonable
2288 price of gas for the information of the Mayor and of the city council.

Q. They had under discussion at that time a rate ordinance?

A. They had and also a new or prolonged ordinance. The result was that they entered into this contract and the city of Minneapolis received gas at 65 cents a thousand and its citizens at 85 cents.

Q. In New York City what was the occasion of your work there, what was the controversy, was it a rate case?

A. It was a rape case.

Q. And what was the nature of the work in Cleveland, did that involve fixing of rates?

A. That involved fixing of rates in Cleveland. The contract that the city have gas at seventy-five cents and it having, the city and the citizens — both expired and the east Ohio Gas Company of which the president was Mr. Dailey, desired to establish the price of gas at 95 cents or at least finally settled on 95 cents after suggesting something higher and I was called in there and not only made the appraisement and the drawings but also investigated their books and the result was that the company agreed to seventy-five cent gas if the output or sales was more than one billion annually and to 80 cent gas if the output or sales was less than one billion annually.

Q. Please state to the Master in a general way how extensive the gas works were which you appraised and valued in New York City in connection with the Wilcox Gas case indicating about the amount of gas sold annually?

A. The gas manufactured on the island of Manhattan amounted to about ten billion five hundred million. The gas sold on the island of Manhattan in the year 1905 amounted to about fourteen and one-

fourth billion cubic feet, the extra gas being brought there
2289 through extensions in underground conduits underneath the East river.

Q. Please state in a general way the capacity and output of the Buffalo Gas works with which you were connected in making an appraisal or valuation of the works.

A. Recalling roughly the Buffalo Gas works was selling between seven hundred and eight hundred million cubic feet annually. Their capacity, however, was about four times that amount but was not required on account of the inroads of natural gas.

Q. Were your services in the city of Buffalo in connection with an ordinance fixing rates?

A. My services there was before a gas commission which is not extinct, it was extinguished in the formation of the public service commission No. 2, the upper part of the state.

Q. What was the character of the gas works which you appraised in Cleveland?

A. They were in part coal gas and in part ca-buretted water gas.

Q. Do you recall the capacity?

A. The capacity of the water gas plant was about three million cubic feet a day and the capacity of the coal gas plant was I think about a million and a half a day.

Q. Do you recall in a general way professor, the number of miles of mains in the distribution system in Cleveland?

A. It was very close to 500 miles of mains.

Q. And what was the number of miles of mains in Buffalo in round numbers?

A. It was something over 400 miles in round numbers.

Q. And in New York City, do you recollect and the Island of Manhattan exclusive of Brooklyn?

A. It is odd, I should have forgotten it. I think, how-
2290 ever, it was 822 miles.

Q. As I understand you in connection with your work in the various cities which you have mentioned you were called upon and did in fact prepare and submit an appraisal or valuation of the respective properties?

A. In each case.

Q. What relation if any do you sustain to the Public Utilities Commission of the state of Massachusetts?

A. I have for the past two years been called before it by the city of Worcester in the matter of rates for public street electric lighting and at intervals have gone before them and communicated the results of my investigations of some sixteen or seventeen different cities in that state.

Q. What professional employment have you had with the city of Providence Rhode Island?

A. The city of Providence, Rhode Island, has employed me to take up the matter of gas and electric light rates and also to take up the study of the physical distribution of the street and public building lighting of Providence, the idea being to bring about a modern and up to date system of lighting of all the streets of Providence. I am due there on the 15th of this month.

Q. Does that work involve an investigation of the rates and prices for gas and electric light?

A. It does for both.

Q. Do you belong to any society or association of engineers and if so what are they?

A. I belong to quite a number. Those of the larger size, American Institute for Gas Engineers, The American Institute of Electrical Engineers, American Philosophical Society, an honorary life member of the Franklin Institute for Scientific services rendered and I am a member of quite a number of smaller societies difficult to recollect.

2291

Q. Now I will ask you Professor Marks, whether you have been employed at any time to do any work in connection with the Des Moines Gas Co.'s property in the city of Des Moines. If so, please state when you were first employed, when you came to Des Moines and what service you have performed.

A. The first I knew of the Des Moines matter was about the 1st of this year and Mr. John MacVicar employed me to take up this matter and about the 1st of February I came out here, remaining here long enough to look around the city and loot at the works in a general way. I returned again later on for a week or two and at that time was granted access to the works and went over them identifying apparatus and forming a general opinion in regard to it. I returned some six or seven weeks ago and since that time have been occupied on an appraisement mostly.

Q. Have you made a valuation of the property of the Des Moines Gas Company based upon the quantities shown in complainant's Exhibit No. 15 introduced in this case?

A. I made an appraisement of the Des Moines Gas works property but I have the mere list of names and the lineal measurements, I have not used the quantities and I have not been given the prices used by the company. The quantities as for instance the brick work given by the company are incorrect. The prices I don't know what they are, have no information.

Q. Did you reduce this valuation to writing in some form?

A. I did.

Q. Have you a copy of it for the Master and also counsel for complainant?

A. Yes, sir.

2292

Q. Is the paper which has been marked Defendants' exhibit No. 23, your estimate of the value of the Des Moines Gas works?

A. It is.

Q. Does this valuation and report Exhibit 23, correspond in its number of the items and in its arrangement with complainant's Exhibit 15?

A. It does. It has references to complainant's exhibit 15.

Q. You spoke about some quantities as shown in the list Exhibit 15 not being entirely correct. I wish you would state to the Master in what respect the quantities of brick referred to in Exhibit 15 are incorrect?

A. This is a case of an inventory and appraisement, it is not a

case of a preliminary estimate. In the making out of the quantities of brick from the measurements I find that Exhibit 15 gives a cubic foot of brick as containing 21 brick or a thirteen inch wall at 22 and one half. This is what is known amongst engineers kiln count and it does well enough for a preliminary estimate because then you always have enough brick and to spare to haul away afterwards. But that is not the actual fact with regard to the inventory count and I will show you what the facts are. To explain what I mean I had a section of thirteen — wall built. It is thirteen inches this way, it is also thirteen inches in this way and it is also 11 and one half inches in height and it contains one and one eighth cubic feet, precisely one and one eighth cubic feet. There is the ordinary three eight-s mortar joint laid underneath, but no mortar joint on top and no mortar joints on the side so that I am losing a three eighths joint on one end of this. When these are actually counted this one and
one eighth cubic feet there are eighteen bricks. These
2293 eighteen bricks are what are known as the ordinary mud brick of Des Moines and are picked up and taken out of an old building just north of the gas works, a building which was torn down so that they are the veritable material out of which many of the buildings, perhaps most of them have been built here. That eighteen brick to one and one eighth cubic feet, the fact is that there is a little over sixteen ordinary Des Moines brick to each cubic foot of wall. In all the company's estimates they have taken twenty two and one half brick to a thirteen inch wall or twenty one brick to a cubic foot and that is just five bricks too many in every cubic foot for sixteen from twenty one leaves you five bricks. And sixteen into five is about 30 per cent. So that the average over estimate of the number of bricks in this estimation, and they have a very perfect list in Exhibit 15, is about 30 per cent and leaving out the gas holders which have been calculated on another unit basis there is in the neighborhood of between six and seven thousand dollars over estimate of brick computed at $16.00 a thousand with one dollar additional for each thousand, scaffolding, or $17.00 a thousand in round figures. That is a fundamental error.

Q. Is the matter which you have just explained referred to in your valuation?

A. In the case of almost every building I have personally picked out a certain area of walls throughout it and counted the number of bricks used taking the corner of the building so that I could see the bricks on the side and at the end the bricks and the thickness of the joints varied some so that you will find in that report that to go on the safe side I have averaged about eighteen instead of sixteen bricks for every cubic foot which has been computed.

Q. What was your principal object in preparing this report
2294 Exhibit 23 in connection with your testimony in this case?

A. In order to find first of all the real money spent, the structural cost of the building and in addition to that to find its present value which is the structural cost less the residual depreciation.

Q. I wish you would tell the Master what you mean by residual depreciation?

A. Depreciation and repairs are linked very closely together, inseparably I might say. If a concern has its repairs very thoroughly made, promptly at the time any weakness appears, the depreciation becomes less because of that care. On the other hand, neglect of repairs means large depreciation. However, a building or a machine is very much like a man, no matter how good the repair or how well it is treated and cared for there is an end to its life which cannot be avoided and there is consequently a residual depreciation going on in a building a machine or a man while any one of them may have the most thorough repairs and care and attention and it is this residual depreciation which cannot be covered by repairs which I speak of when I say that the structural cost of those buildings and of the whole plant is in the neighborhood of $1,700,000, the residual depreciation in the neighborhood of $300,000 and the present value in the neighborhood of $1,400,000.

Q. In connection with your rep-r-, Exhibit 23, did you endeavor to ascertain by your investigations the cost of supplying gas to the consumer's meter and if so please state what investigation and analysis of the books and records of the company you made?

A. Of course in the limited time which has been afforded I was not able personally to examine the books and had to rely upon the accountants employed by the city. These accountants verify-
2295 ing accounts giving me the resulting figures for five years back, by that I mean the cash operating costs. Taking these figures and dividing it by the sum total for five years, by the sales for five years as reported by the company, and we have to accept what the company shows in that matter I find the cash operating cost per thousand cubic feet to be 63.33 cents for gas delivered at the consumer's meter. In addition to that there is this residual depreciation of nearly $300,000 which would have to be divided by all the gas made by the works since it started as near as we could estimate it and that was in the neighborhood of five billion cubic feet. It is recorded up to about four and a half billion cubic feet and presented in one of the exhibits here. That gave about six cents for the residual depreciation on each thousand cubic feet as a charge. There is no possible connection as a rational and practical matter between the depreciation of the works and machinery and apparatus and the amount of gas made. The depreciation is dependent upon the time elapsed and upon the value of the apparatus used and this is not largely affected by the volume of the sales or output so that this six cents is an arbitrary quantity put in simply because the company should be allowed to recoup itself to that extent for the residual depreciation which cannot be prevented. That made the cost of gas including the depreciation at the consumer's meter 69.33 cents. I think that is what you wanted.

Q. Yes, I wanted you to explain whether or not in your report you have gone into the question of the cost of gas in connection with your valuation and I think you have covered that fully by your answer. Now I want to ask you this question, in making your val-

uation of the property of the Des Moines Gas Company and
2296 compiling your report Exhibit 23, whether or not you have made any personal inspection and investigation of the company's property and if so to what extent.

A. I examined and identified all of the more important pieces of apparatus on the land of the company and in its buildings, examining also the buildings as I went around. It is plainly impossible that I should have examined the street mains under the ground, the services or the meters in the cellars of the houses served. I found the list exhausted and complete many things being mentioned in it that ordinarily would not be taken notice of because they are practically scrap, nothing being omitted that I have been able to find.

Q. That is now you are referring to the property scheduled in Exhibit 15 are you?

A. Yes, sir.

Q. Are the descriptions of the buildings and apparatus shown in your report Exhibit 23 based upon your personal observation and investigation of the property of the Des Moines Gas Company?

A. They are with the qualifications which I have already stated to you.

Q. Now I believe in your report Exhibit 23, and I will call your attention to it later on you make an appraisement of the low carburetter water gas apparatus. In making that appraisement were you obliged to depart from the order in which it was set forth in Exhibit 15?

A. I was for the reason that the United Gas Improvement Co. is practically the sole manufacturer of the low water gas apparatus in the United States, although I do not know that it has any monopoly of it under patents. It usually when apparatus is put in gives a lump bid for all of the apparatus that is required for each
2297 capacity of course not insisting on this but finding it the more convenient way. I happened to have in my possession a contract signed by the United Gas Improvement Co., for three million cubic feet daily capacity plant. The contract price being given and the diameter of the generators being eight and a half feet which is not very far off from what they have right here although they have one generator somewhat larger. Using a proportionate amount for the larger generator made it very easy for me to find that the contract price which differs from the structural cost in this case would be for all of the apparatus about $50,000.

Q. From your experience as consulting engineer and keeping in mind the work which you have done in connection with the investigation of gas works, making appraisals of the same, I will ask you to state if the list of quantities contained in Exhibit 15 indicate that the company has included all of its property which you would expect to find in a gas works of this size.

A. It has and more than is usually included in such appraisement lists.

Q. I want you to tell the Master in a general way the manner in which you arrived at the unit values of the quantities as used by you in your report, Exhibit 23?

A. Going more into detail I opened the book of details at random and I find that for building No. 10, smith, carpenter shop and store room, I measured, and this is personal measurement, a portion of the building and find from these measurements that in building No. 10 there are 16.53 bricks in each cubic foot. I in the same way measured most of the buildings in the yard. Now with regard to the matter of unit values my first care was to find out the cost of labor and material. For instance on March 14, 1911,
2298 the following scale of prices for labor was given to me from an authoritative source in Des Moines. Bricklayers 70 cents an hour. Plumbers 60 cents an hour. Carpenters 50 cents an hour. Building labor 33 cents an ho-r. Tinners forty cents Pipe layers 35 cents, electrical workers 50 cents. Cement workers 50 to 55 cents an hour. Plasterers 62 and ½ to 70 — an hour from and after May first of this year. Painters $3.60 to $3.90 for an 8 hour day. Iron workers 50 cents an hour. Lathers $5.0- to $5.00 a day. Stationery engineer work, $3.15 to $4.50 a day. I also had the statement made to me by parties familiar as engineers of the cost of material and also by contractors that the cost of excavation here in this city in the streets for the purpose of laying conduits or pipes was about 40 cents a cubic yard including back filling. I recollect Mr. King, contractor for all underground telephone conduits has made that statement to me. It was also verified by others whose names I cannot recall. I also recall a statement made to me by Mr. Dobson who was formerly city engineer of this city that such excavations could be made on the land where the gas works is here if you could use a horse and scraper which is the way in which they dug out their foundations there was worth about 15 cents a cubic yard. In fact that the contractor for this bridge out here had a bid of doing the excavation of 15 cents a cubic yar- a local bid and refused it because he thought he could get it out cheaper than 15 cents a cubic yard with his own apparatus. Also the cost of digging excavations 12 or 14 feet deep to hoist the material out would be about 50 cents a cubic yard and that t/e cost of excavation ran all the way from 15 up to about 50 cents a cubic yard. In regard to brick work or brick they have a brick here they call mud brick, this mud brick I have shown of an old building, mud
2299 brick of standard size and I presume it is mud brick all old buildings of the gas works are made of.

Mr. GUERNSEY: We move to strike out the witness' presumption as not anything responsive and certainly nothing that is competent.

A. From that up to hard burned red stock brick at about $8.00 delivered. It is difficult to say what this mud brick is worth but six or seven dollars was guessed at as being about what—— I examined this mud brick very carefully in their old generator house using a finger nail to scratch in it and I found that the powder ran down freely so that it was very poor quality. It is something new to me and I would not have been awarre of its peculiarities if my attention had not been called by a former city engineer to it. In regard to the price of lumber I got a number of figures from

various lumber people about town and found on making inquiry and the company may have been subjected to this too, that if one had enough lumber to make it worth while to inquire to a point on the Mississippi that a very great reduction would be made for car load lots way below anything that the people here would bid. So the price- that I have fixed for lumber here are very much higher than probably a shrewd contractor could get it for. I refer more particularly to the building of this bridge, Walnut street bridge is it?

Q. Yes.

A. Who made that statement.

Q. You refer to Mr. Wheeler?

A. Mr. Wheeler, yes. I don't recall any other details except that so far as I have been able I have omitted no opportunity to learn the price of iron castings for instance, you take common
2300 casing of the common kind frequently used, we will say a lamp post, made in large quantities would be a little over two cents a pound, probably you would find three cents an outside limit. It is very much so with wrought iron. The wro-ght iron used with corrugations for reinforcement of this bridge I may be wrong in this matter, but I think about two cents a pound, may be a little less. Of course I only sought prices from men I considered able and competent men. I am not talking about buying in small quantities.

Q. You made mention in one of your answers of the defects of some of the buildings used in the manufacturing plant of this company. I wish you would be a little more specific and tell the court what criticisms you have to offer against the buildings?

A. The new building, the generator house inside the yard, the boiler house and what they call the engine house appears to be built of good hard burnt red sand brick called here a shale brick and built with good mortar. Take the building on the northwest corner of the northern lot in which they have a lot of exhautsers and other machinery it appears to be of the mud brick variety. The roof trusses are of a very common kind such as are used *in st*anties and cheap stables. The walls have sagged and gotten so that they found it necessary to put iron tie rods through from side to side and then for fear the tie rods would pull loose in them they have put iron stays across to keep them from drawing out and hold them that way. The only value of these buildings is because of the locality and machinery in them. If they were empty buildings they would be considered valueless not worth the cost of tearing them down for the sake of the m-terial. The roof of the building on the northeast corner is part tin and part rubberoid. It is very
2301 much out of line—I beg pardon I didn't mean rubberoid, it is part tarred felt, very much cheaper than rubberoid. It is very much out of line and while it might hold water it looks in very bad arch*i*tectural shape. In examining the walls of this building on the outside you will find it very carefully painted and yet if you will look at it closely you will find they have had ap-ertures in it

punched and filled up again so it is difficult looking at the painted wall to see just how the walls were originally built. Take the roof over the separate gas generators, the corrugated iron roof in the northwestern corner, it is as full of holes as a seive, so that the rain would pour down in on the apparatus underneath and evidently it has for the brick floor around their ge-rators has heaved and sagged so there is a difference of level of five or six inches in successive waves going up and down as you walk over the floor. Tha abandoned retorts, old abandoned retort house, some of the trusses have been taken down and there is no roof at all over it. Part of the wall has been knocked down so that they could build an addition to the boiler house. All of these I find very carefully lifted and all of the quantiti- put in.

Q. Were these some of the building- which were illustrated here in drawings which were produced here in evidence?

A. Yes, sir. The drawings were as carefully made as though they were for a new building to be built in the best possible manner and would serve that purpose.

Q. In making your valuation of the manufacturing plant have you considered in connection therewith the condition of the buildings to which you have called attention?

A. I considered, computed and added 12 and one half per cent overhead charges and depreciation to each building according
2302 to Summer's rule for depreciation. This Summer's rule for depreciation is the one adopted in the city of Cleveland as a whole, in part by the city of New York and I understand adopted now by the tax assessors in a good many of the cities of the United States, although I don't know specifically.

Q. That is the method of computing value of buildings?

A. Yes, present value of buildings for taxation purposes.

Q. In what manner were you able to verify the company's list of quantities with respect to its distribution system, its services and meters as also the apparatus used by the company in serving customers in Valley Junction?

A. Buried material it was of course impossible for me to do otherwise than accept the list furnished b- the company. It would be quite impossible to dig it up. I have no reason to believe thathere was anything omitted or that any of the measurements were incorrect.

Q. So that you have accepted the quantities given by the company in Exhibit 15.

A. I beg your pardon I have not accepted them, I have made use of them as the only available material.

Q. And you have not deducted on account of any observations or investigations on your own behalf?

A. I have made no deductions having no knowledge that would authorize me in doing so.

Q. Do you know whether or not in supplying gas to consumers in remote parts of the city especially the western portion of the city and to serve Valley Junction the company is obliged to use gas pushers or any other device for reinforcing pressure?

A. I know that the company does use what is known as gas pushers two of them, and also the special high pressure main
2303 leading out to the western portion of the city and I have been told that it is included in the street main system furnished and I have accepted them believing it to be good engineering and a wise precaution and computed the values not only on the gas mains, but als- on the pushers.

Q. So as I understand you in the distribution system of the Des Moines gas company you have included therein this high pressure gas pipe running from the works to Valley Junction?

A. If it is included in the list furnished by the company I have done so.

Q. I presume I am safe then in saying that you have not deducted from the list showing distribution system anything on account of this high pressure main which serves Valley Junction?

A. I have not. And I should have added that while I saw what appeared to me to be abandoned or possibly abandoned mains or extra pipe in and around the yards, yet I did not deduct any of these either from the list furnished by the company.

Q. And I presume you are not able to say are you just what underground pipes connected with this abandoned apparatus is included in this list?

A. I cannot.

Q. Did you make any deductions on any presumptions indulged in by you with respect to abandoned apparatus?

A. None whatever.

Q. How have you treated river crossings in your report?

A. In the matter of river crossings I have carefully computed the probable engineering cost of getting these pipes across the river. I have taken the 16 foot pile shown in their drawings and knowing
2304 that a pile driven would probably cost about 50 cents a foot allowed $8,000 for the pile driven and a couple of dollars for the yoke which attached the pipe to the pile. I also made allowance for the extra ditch and an estimate of the cofferdam work. I have no means of knowing how this cofferdam work was carried out or whether or not the pipe was laid in part by means of cofferdam or in the usual way suspended from frames and lowered into the water. I can give you the exact amount of the estimate.

Q. You are referring now to your report?

A. I am referring to Exhibit 23.

Q. Tell us where that can be found, what page?

A. Page 56. Turning over to page 57 I find that the estimate I gave for the mains laid underneath the river is $14,277 and the mains laid in the street, the estimate is $638,670. And on the top of page 58 the total cost of the whole main distributing system $652,947.00.

Q. I will take these items up more in detail later on. I simply wanted you to state at this time in a general way the manner in which you treated river crossings and what method you provide for their construction and that you have set out in some detail at pages 56 and 57 of your report, Exhibit 23.

A. I have.

Q. With a note outlining the process of constructing river crossings and at page 58 a recapitulation in which these items are included in cost or present value of the distribution system.

A. I have.

Q. Have you taken pains in connection with your investigations to inform yourself with respect to the character of soil in the city of Des Moines which would be naturally encountered in con-
2305 structing trenches for the purpose of laying gas mains therein?

A. I have availed myself of every opportunity to learn about the soil hereabouts from experienced and practical men asking Mr. King, the contractor, of whom I have already spoken about any difficulties that he found in the nature of rock or extremely hard excavations. I inquired also of Mr. Dobson who had been city engineer and been busy with sewer work as to whether or not any difficulties were found in the deeper excavation of sewer work. The reply in both cases was that there was no point in the city where the difficulties were at all serious due to heavy rock work or anything of that sort, that the soil at some points was alluvial formed of silt and stood up fairly well and other points it was gravelly and would stand up without bracing for any ordinary depth of four or five feet of ditch. In fact, I then examined any openings that I have been able to find here for sewers or in the streets. There is a building being built now just north of Locust street the other end of the bridge or just north of Walnut street where you can see a sheer excavation of six or eight feet. It stands fairly well not requiring any bracing to amount to anything at any point and take it for three or four feet would not require any at all. I also examined a building up on Locust street that has a cellar, or a proposed building up there where there is quite a deep excavation as compared with ditches. There again I found this gravelly stiff soil and from all I have been able to hear from men whose experience was sufficient to make their opinion worth anything the soil here is peculiarly favorable to ditch work.

Q. Did you ascertain from your investigations anything which lead you to believe as an experienced consulting engineer that
2306 there were any conditions in Des Moines extraordinary or hazardous with respect to digging trenches?

A. No, I was told and from what I saw I believe that exactly the reverse is true that conditions are more than ordinarily favorable.

Q. What have you used in your report Exhibit 23, as representing the unit cost for excavations, unit cost or price?

A. Well, in Buffalo, New York, in 1907 I had access to the official records of cost of excavation——

Mr. GUERNSEY: We object to all this as hearsay and not responsive to this question.

Mr. BRENNAN: I suppose he wants to explain. That question perhaps calls for some explanation.

Q. I want you to tell the Master the price, unit price used by you

in your report Exhibit 23, representing the cost of excavations and how you arrived at this unit value?

A. Well in Buffalo I had occasion to originate a graphical system of recording costs in a gravelly or alluvial soil. For this purpose I made a very large number of computations based on the actual records of the cost of laying pipe, water pipe in the city of Buffalo, New York. The whole of it after being tabulated was reduced to a graphical form for sizes of pipe running from two inches up to 60 inches in diameter. The basis for the excavation and back filling in this ditch which was used in this place, the ditch being dug under the ordinary difficulties occurring in the streets of any city such as interference of sewer inlets or going under street railways or going under steam railways or occasional slight difficulties from water, small quantities of rock and occasional small quantities of paving and crossings that come up in other words what might be
2307 called the rough and tumble condition of the city street work as is usually the case they kept out of the way of the more expensive pavements as far as they could. Under these conditions I have the actual practical fact of the cost of excavation and back filling in these ditches of various sizes average about 4 cents a cubic foot. The question then came up of the cost of the cast iron mains. This was 1907. The cost of cast iron mains was taken from the records of the purchase of the city of Buffalo for water purposes and $1.00 a ton added to the piping used for gas purposes. The pipe used for gas purposes being nearer the standard dimensions are lighter than the pipe used for water purposes. The average price the best price of that year for the small three inch pipe was in the neighborhood of $30.80. Where large quantities are used they are not apt to lump all sizes under the same price so that in getting my average for five years back of 1907 I had the following prices given: Three inch cast iron pipe per ton of 2000 pounds $30.80. Four inch, $28.80; six inch, $27.80; 8 inch $27.80; ten inch $27.80; 12 inch, $27.30; 16 inch, $27.30; 20 inch $26.80; 24 inch $26.80. I won't carry it any further because I think the Des Moines company has nothing larger than 24 inch mains.

COURT: That is for the pipe alone?

Mr. GUERNSEY: We move to strike out all of the witness' answer because it appears it does not refer to conditions in Des Moines, but refers to conditions in Buffalo at the period indicated, 1907, because it appears this plat was copyrighted by the witness in 1907, March 20th, and for the further reason that the witness has not answered the question and the answer is not responsive, the question asked
him what his unit prices were in Des Moines and his answer
2308 being a dissertation on conditions in Buffalo five or six years ago, and it does not appear any of these matters are based on the witness' personal knowledge or experience set out in this plat.

A. So by reason of checking up these prices, by reason of quotations in 1910 I found from the Iron Age which is authority, I think May 16, 1910, I am not sure about the month, that the average price quoted for cast iron pipe was about $30 a ton.

Complainant moves to strike out the answer for the same reasons.

Q. What I am getting at is the manner in which you arrived at your unit prices for excavation you have adopted as I understand 40 cents per cubic yard using the back filling, including back filling?

A. Yes, sir.

Q. Now I want you to tell the Master just how you arrived at 40 cents representing the reasonable price or charge for that kind of work?

A. By taking all of the excavations labor that was charged to the ditch work in Buffalo, compute the cubic contents of this ditch work and as I explained before not making any allowance for ordinary obstruction, but taking the rough and tumble conditions I found 40 cents covered the back filling and the excavation in the city of Buffalo in the ditches in the ordinary streets of Buffalo.

Q. Now in applying conditions in Buffalo to Des Moines was it necessary to increase or decrease the unit values which were used there?

A. Seemed to be as near similar as possible to find them.

Q. What I wanted to know was if anything in conditions in Des Moines required this unit price to be raised or lowered in
2309 making valuation?

A. What I was trying to do was to give you my unit price, not only for excavations but also for iron mains and also for such further details as occur in street laying.

Q. Have you talked with persons in the city of Des Moines who have had actual experience in making excavations?

A. I have.

Q. You have received advice from them as to their experience?

A. I have.

Q. I wish you would refer to Exhibit 23 and tell the Master what you estimate the actual present value of the street mains to be?

A. On page 58 near the top of the page total present value of mains $852,947.

Q. Now just what items are included in that total sum that you have just named?

A. The cost per ton of two thousand pounds of cast iron pipe of each diameter the weight per foot length in pounds, special castings, lead, cement, and so forth for joints, carting pipes, tools, etc., labor, miscellaneous special castings and ditching mostly in streets without pavements.

Q. Now you may explain to the Master the manner in which you arrived at the cost of cast iron pipe which you have used in this report, explain as fully as you care to?

A. The cost of cast iron pipe varies with the cost of pig iron. It does not vary very greatly, and since 1883 has hovered around about $30 a ton being on the average some below it.

Mr. GUERNSEY: I think the record ought to show this is not testimony of the witness, but he is reading from a book here.

Mr. BRENNAN: Simply referring to the table there I don't think he has been reading anything from the book.

2310 Q. Just state what you are using?

A. Page 393 of hand book of gas data by Gillette, copyright 1905, published 1906. Finding that the cost of iron as quoted by the Iron Age 1907 and 1910, was not different to any extent I adopted the Buffalo Table. However, I was not willing to adopt it merely on the basis of the coincidence of the price of iron and so I referred to the prices fixed by other parties in Cleveland and in Des Moines page 53, Exhibit 23. The secretary of the Cleveland Gas Light & Coke Co. gave the following scale of prices or cost per lineal foot of laying cast iron street mains in 1904.

Objected to by complainant as hearsay, secondary and incompetent on that account.

A. For three inch cast iron pipe 36 cents.

Mr. GUERNSEY: What page do you read from?

A. Page 55. For three inch cast iron pipe 36 cents a lineal foot. For four inch cast iron pipe 47 cents a lineal foot. For six inch cast iron pipe 65 cents per lineal foot. For eight inch cast iron pipe 93 cents per lineal foot. For ten inch cast iron pipe, $1.19 per lineal foot. For 12 inch cast iron pipe $1.44 per lineal foot. For 16 inch cast iron pipe $2.17 *cents* per lineal foot, for 20 inch cast iron pipe $2.80 per lineal foot, for 24 inch cast iron pipe $3.75 per lineal foot.

Q. In arriving at the value of cast iron pipe for use in connection with your valuation of the property of the Des Moines Gas Co., did you have the benefit of the testimony of William Henry White given in the case of the Capital City Gas Light Company against the city of Des Moines, or City of Des Moines against the Capital City Gas Light Co., in this court?

A. Top of page 56 of Exhibit 23 William Henry White——

2311 Objected to for the same reasons, incompetent, hearsay, immaterial and further because it refers to conditions about seventeen years old at the present time.

A. William Henry White gives the following scale of prices——

Q. (Question read.)

A. Yes, sir.

Q. And is that referred to in your report, Exhibit 23?

Same objection.

A. Yes on top of page 56.

Q. In making your appraisement of the property of the Des Moines Gas Company have you considered in your report the question of expenditures involved during the construction period, and if so just please tell the Master what you have assumed with reference thereto.

A. In Exhibit 23, pages 7 to 10, inclusive, I have given the overhead charges on the contract price of work furnished at 12 and one half per cent.

Q. What do you mean by overhead charges?

A. Interest during construction period drawings and supervision the taxes during construction period, the general manager during construction period. I have not included anything for omissions because of the fact that all of my work is based upon a verified inventory and particularly in this case there appears to be nothing left omitted, if there is any fault to be found with the inventory it is an excessive detail.

Q. What period have you assumed as covering the construction period?

A. About a year and a half or rather two summers.

Q. Just tell the Master why you assumed that period of time as being required or necessary and also if the time which you have assumed is based upon some former experience which you

2312 have had in laying gas mains.

A. It is obvious I think to everyone that two summers would suffice to put up all buildings and apparatus in the yard or on the land of the gas works, the real cause of delay in a gas works like this would be the possibility that 180 miles of mains in the streets could not be laid in two summers, but it is a fact *the* derived on my part from personal experience in laying mains that it ought not to be difficult for a gang of from 450 to 500 men to lay down 180 miles of mains in such digging and under the conditions existing in the city of Des Moines. My reason for venturing this opinion is the fact that I have underlaid nearly all, in fact all of the busy streets of Philadelphia, between the Delaware and Susquehanna and South street on the south to Vine street on the north with electrical conductors and conduits and at various oth-r times I have made or superintended the laying of gas mains in Durham and Fostoria and in St. Louis beginning to get practical knowledge of the difficulties that occur there and knowing how relatively slight the difficulties are here as compared with the difficulties say for instance in Philadelphia.

Q. Did you have any similar experience in St. Louis?

A. In St. Louis the gas works stood on the levee and on main street when it was necessary to lay a particular main up Washington Avenue one of the pr-ncipal streets there, a large main and it was then in this district my first experience. I was what was commonly known as a squab engineer, I was put in charge of a gang laying mains up that street and I had quite an experience too.

Q. What period of time was required to perform the work in Philadelphia you have described.

A. About two summers. It was performed if I may ex-

2313 plain, it was performed under very great difficulty, difficulties of a great deal of trackage. It was necessary by order of the director of Public Safety that no two connecting blocks should be opened at the same time. We had to dig our ditch, open the ditch, lay our conduits and get it covered up again and the pavement *at* loosely put back before the inspectors allowed us to lay the next block. The blocks in Philadelphia are about 550 feet long and it was necessary to do a great deal of maneuvering in order to get

through with the work and divide the gangs and systematize the work.

Q. Did you have charge of the supervision of the gangs in Philadelphia?

A. I had entire charge of everything in connection w-th the work there.

Q. And was that true to any extent in St. Louis?

A. My duties in St. Louis have grown rather dim but I was obliged as inspector and resident engineer to see that all contracts complied with the specifications and I was obliged to keep all the accounts of the concern too at the same time. I had to see over all the work but towards the end of the fifteen months which was occupied by putting those works together that inspection work down at the yard slacked off and the president or the vice president, acting president started me out on the streets with the pipe laying gangs.

Q. In a former question I asked you to tell the Master how you treated river crossings in your report and I don't know whether I askes you to tell us how you have treated steam railroad crossings and street railway crossings. If not I wish you would now state how you have treated them in your report, Exhibit 23.

2314 A. Of course a street railway crossing and steam railway crossing make a certain amount of interruption in your work when you come to it. If you can you are very apt to tunnel it. If there is a concrete bed underneath t-e street railway, there sometimes is, I don't know whether there is here or not it is very convenient business to take a long handled shovel and tunnel and run things through and fill it in again. If it has not you would probably have to get a couple of old ties and lay them along side the ditch and underneath just close to the rails as you can and hammer them in there with a bar about all that is necessary to do in an ordinary street railway crossing, probably cost you a dollar in extra trouble. As far as steam railways are concerned it may be necessary to do a little more than that but ordinarily there is very little attention paid to it. The inspector for the railway is on hand and the job is driven with the utmost rapidity. The work where a steam railway is concerned is alike inconvenient to the steam railway and dangerous for the men but I have no reason to believe that there is any more difficulty here or as difficult here as it is in most other places and if it was necessary to go under these roads I would not allow as a contractor more than about a dollar per pair of rails.

Q. Have you taken these matters into account and included them in your appraisal shown in your report?

A. That is another reason why I adopt the Buffalo price, keep going back to it all the time. All of this work was done not under ideal conditions at all, but under annoyance and trials and tribulations that occur in actual practice and these are all included. Did not make any deductions from the pay roll, from the material or because of unusual conditions. Just charged them in there along with the rest.

2315 Q. Now then while we are on this subject of street railway crossing and steam railway crossings and the difficulties that

are ordinarily encountered in making excavations in the streets and having to encounter the interruption of traffic and all these things just how have you applied the experience which you gained in Buffalo to conditions in Des Moines on this assumption that it would require you the use of two summers to lay 180 miles of mains. That is to say about as you applied conditions here as to comparative labor and material, etc.

A. First of all I satisfied myself as I stated before that the price of labor averaged about the same as that did here in Buffalo, that is about the same in Buffalo as they did here. Then I had to find out whether there was any variation in the cost of cast iron piping that amounted to anything. Then I had to find out whether or not there was difficulty in street excavation here that did not occur in Buffalo. I found out that it was easier to dig in the streets here in this land than it was in Buffalo. Then I checked my own opinion by comparing carefully the different rates of each size of main with the rates given by William Henry White in his appraisement of mains here. I found Mr. White's appraisement was lower than mine, that my figures were higher than his per lineal foot. I found also that the Cleveland figures per lineal foot were lower than my figures out here.

Q. I believe Professor, you made some mention that you have not allowed for omissions and I want to ask you this question whether as an experienced consulting engineer if you had been furnished with what purported to be a true accurate and complete list of the quantities entering into and forming a manufacturing plant and distribution system of a gas works together with all services
2316 mains and connections, buildings, apparatus and all property both real and personal constituting plant and gas works in making up your appraisal or your valuation thereof would you or would you not under those circumstances add anything thereto for or on account of omissions.

A. I would not make any addition to such a list as that after my comparison with it and finding its thoroughness and completeness.

Q. In this particular case from investigation you made of the inventories to verify the list of quantities contained in Exhibit 15. Were you obliged either to deduct or add to the list for any reasons?

A. I made no deductions and no additions to the list.

Q. What I want to get at was you took this inventory and listed quantities Exhibit 15 and you have made the investigations and verifications which you have told us about, I want to know now if going over the list of properties in your inventories, to verify the list if you were called upon to note anything or add anything to your report which had been omitted in this list?

A. I found no omissions whatever.

Q. Did you find from your investigations or observations that any of the properties shown in Exhibit 15 was not in use or had the appearance of having been abandoned, if so please tell us what it was?

A. I found a wreck of a bench of coal gas retorts standing in the

northern or northwestern part of the building in which or on which the roof had been removed or had fallen in. I also found two water gas generators in the northeastern corner which looked as if they had been very little used and the machinery specially intended for them in the next room I might say was practically out of use. I found an elaborately drawn coke shed which was
2317 tumbling down, or bursting, standing out on one of the lots the walls apparently burst open and the coke was flowing out from the walls from every side. There were quite a number of buildings, for instance like the oil barrel store house carefully drawn which evidently was built out of scraps picked up around the works, stray pieces of lumber, it was good management but was not a very valuable building after it was built. There seemed to be more or less material on hand there, but it was not inventoried, I mean such material which was not inventoried, but intended to be in working capital and it looked to me like a surplus and some of it very old. Special castings and that sort of thing.

Q. So that in a general way this property which you found had the appearance of not being in use?

A. Yes, sir.

Q. Now taking up your report, Exhibit 23, you first use a table of contents or an index. Then at page 1, Section 1, you state the object of your report and incidentally you say the growth of the consumption of gas is related to its price, that is considered in con nection with your report.

A. It is.

Q. Section 2, you describe this appraisement list Exhibit 15, which was furnished you and you make your comments on that?

A. I do.

Q. And in that same connection in Section 2, you make mention of this discrepancy between the actual cou*b*t of the brick in the wall and computing it upon the wall measurement?

A. I do on page 2.

Q. And that you have demonstrated for the Master by the production of a model here on the desk using a certain number of
2318 brick and mortar of a certain thickness which by measurements is what size?

A. I have done so.

Q. I say what size have you found from the measurements of this brick which you have shown here is?

A. It yields sixteen brick to the cubic foot. The size of the model which I have gotten up here is thirteen by thirteen inches by eleven and one half inches high. This model gave me one and one eighth cubic feet of nine eighths of a cubic foot and there are eighteen bricks in those nine eighths amounting to sixteen bricks to the cubic foot with this old fashioned form of mud brick commonly used until a few years ago in the city of Des Moines.

Q. Well now in the buildings then have you stated the discrepancy in percentage?

A. In each building I have measured the brick to the wall so as *and the wall so as* to be able to state just how it varies.

Q. Now section 3 at page 3 of your report refers to the accounts and records of the Des Moines Gas Company and that suggests this question to my mind whether or not in making up your appraisal and finding the actual present cost of the property of the Des Moines Gas Company you were influenced in any wise by the reports which you received from the city's accountant with respect to the situation on the books or what the books actually show as representing the costs of those items?

A. With the exception of the operating costs in which I was wholly dependent upon the books all of my appraisement was done before the accountants were able to give me any figures. I had to anticipate any result which they might produce. All the figures with regard to construction which I quote are subsequent to the completion of my appraisal.

2319 Q. So that the actual present value of the property as shown in your report is an independent valuation found by you along the lines and by the methods set forth in this report Exhibit 23, and as testified by you upon the stand today in identifying this report? Is that correct?

A. That is correct.

Q. At pages 5, 6 and 7, you take up the subject of depreciation and proceed to subdivide the subject by using first physical decay, next obsolescence and then inadequacy. Is that the manner in which you divide the subject of depreciation?

A. It is.

Q. By physical decay I presume you mean when it was worn out and cannot be longer used in the service?

A. That is what I mean.

Q. And obsolescence where the apparatus has not kept pace with the art, or where the art rather has progressed beyond the apparatus?

A. Yes, sir. A very good example of that is the old gas lamp posts which are superceded by electric lights on the streets, became obsolete.

Q. In what manner does inadequacy form an important factor in depreciation?

A. Inadequacy occurs practically in rapidly growing places like western cities and towns and is occasioned in this way, when it is necessary to take out we will say a small main and put in a large one it is a custom to charge the cost of a small main and deduct it from the cost of the large main, the difference being charged to capital account and then the cost of the small main which is taken out is charged to repairs and the consequence is that inadequacy is very apt to disappear entirely without going into depreciation except for the residual depreciation of which I speak at considerable length which means an incurable depreciation no matter how fareful your repairs may be.

2320

COURT: What is your allowance where the property is kept up and in good repair?

A. Per thousand cubic feet?

COURT: I don't care how you put it, I just want to know what your allowance is, I just want the figures.

A. I will try to give it as briefly as I can. In the case of the works and the yard the total depreciation is about two and a half per cent, subtract from that your repairs and you get the residual depreciation.

COURT: Now for mains, services, etc.

A. In a cast iron main there is no depreciation whatever. Cast iron in the ground so far as we are able to learn from practical experience does not depreciate beyond rusting a certain amount and then stops. No man has lived long enough to know what the life is of a cast iron main. We have no records far enough back. The residual depreciation of a wrought iron service pipe is about seven per cent on the value of the pipe less the repairs for one year. The residual depreciation for meters is about fifteen per cent on the value of the meter less the cost of repairs. I think I can refer you to an article here which will give you a better understanding.

COURT: I will read this as it comes along.

A. On page 77 Section 94 residual depreciation is discussed at length in this report.

Q. Now the next item appearing in Exhibit 23 at page 7, and at section five, is the item overhead charges. What do you mean by that item.

—. When a contractor takes a contract for instance to build a gas holder he has his contract price for it which is to
2321 be paid to him. As a practical fact that contract price is not all the gas holder costs the gas company. The gas company has to have an engineer whose business it is, even if he does not make the drawings to prescribe the proper dimensions of the gas holder and to see to the location of its tank and the digging of its tank. Also has to have an inspector whose business it is to see that the gas holder is put up as specified in the contract.

COURT: That is sometimes called superintendence and construction?

A. Drawing and supervision. In the case of the Laclede Gas Works of St. Louis was the first case I know of, and William Farmer New York's greatest engineer in those days charged one per cent of the cost of the gas works, none of the street distribution, for his drawings and specifications. The gas works cost about $750,000 and he received $7,500. During the eighteen months' time that a foreman and an engineer, a resident engineer were busy in looking after the work following out William Farmer's drawings and specifications, about the same amount was paid in the amount of salaries for what might be called supervision, that is about $5,000 a year, making two per cent.

Complainant moves to strike out the statement of the witness as to Mr. Farmer's charges in St. Louis and as to the extent of the plant in St. Louis and the other expense referred to in St. Louis as not proper direct examination and as offering no criterion as to what the cost would be for services of an engineer at the present time in the city of Des Moines, and is therefore irrelevant and immaterial.

A. At the time there was a certain amount of it seemed to me

unnecessary and rather costly organization expenses amounting to about four per cent or twice what the drawings and super-
2322 vision cost. In the matter of taxes it is a very rare thing that taxes are charged on unfinished buildings or an unfinished piece of machinery so that the taxes would be practically only on the land and perhaps a little towards the end on some of the completed buildings so that I have put the taxes at two per cent. And the question of interest, interest being fixed at six per cent on the amount, nine per cent on the contracts in the eighteen months provided they were all paid for at end of eighteen months or at the end of nine months. The real fact of the matter is the great bulk of payments are not made on contracts or anything except pay rolls until the job is practically finished so in allowing four and a half per cent interest for half the time required in construction is a very liberal allowance making the aggregate of interest four and one half per cent drawings and supervision two per cent, taxes two per cent general management four per cent, total 12 and one half per cent overhead charges.

Q. Does that include meetings of the board of directors and legal advice and matters of that kind?

A. It was what I meant to include.

Q. The aggregate amount of your overhead charges is 12 and one half per cent?

A. Yes, 12 and one half per cent representing overhead charges.

Q. In what manner is this 12 and a half per cent overhead charges applied to the property appraised by you in this report?

A. Taking for instance a gas holder, it is evident the contract price, that is the price to be paid to the man who builds the gas holder on the ground, 12 and a half per cent is added to it. That gives you then what might be called the structural cost to the company. If the gas holder is depreciated by long usage or by
2323 any length of usage the proper depreciation is taken from it and that leaves you the present value of the gas holder.

Q. What I wanted to know is if this overhead charge of 12 and a half per cent is applied to any of the distribution system for instance, or if confined to buildings and apparatus and machinery used in the manufacture of gas?

A. It is confined to the machinery and apparatus and buildings used in the manufacture of gas and does not apply to the distribution system in the streets such as the street mains and services, but does apply to the meters in the cellars.

Q. At page 10 near the close of section 5 of your report, Exhibit 23, I note that you make some reference to the application of ten per cent in distributing charges and 15 per cent margin for profit or bad management extending over the property outside of the walls of the gas works. I wish you would tell us how you arrive at those amounts and why you apply them in this way?

A. When a gas works starts up it starts only a small patch of its distribution usually at the beginning and puts in only a few services. After getting to going it keeps surrounding it a gang of caulkers, a boss caulker and boss fitter usually and these men with such

help as they need extend the street main system and put in the house services as the demand comes for them. The result is that they do not and they cannot no matter how good men they are do as cheap work, as economic work—I won't call it cheap—as they would for a large contract where an organized gang of men could be got out for laying street mains and for laying services. After finding the raw material and the labor as well as I can and from such
2324 authorities as I could in the matter I add ten per cent for undistributed charges meaning by that whatever portion of the time of an official of the company might be required in chasing these men around looking after the work, receiving salary of all the officials of the company, but you only could get it by guessing, making a guess, it does not appear. So this ten per cent is added more for the sake of being on the safe side towards the company in the matter of the cost. The 15 per cent on top of that makes 26 and one half per cent on the original cost of raw material and labor and is added because of the fact which cannot be gotten away from that doing work on the installment plan here and there all over the city as it is handled requires a great deal of time getting to and from it and in getting ready for it and necessarily renders the labor of the men less effectual so that the 26 per cent added to what might be called the bare cost, contract cost if it was a contract job to afford a good margin for the contractor and if it was a small job take care of the company and its necessary loss in doing it.

Q. How have you computed the meters and services, what overhead charges are included therein?

A. The services nowadays if they are not ought to be about one and a quarter inch in diameter and ought to cost in the form of pipe about five cents a foot net. To that I have added from purely practical results four cents a foot for such fitting and handling and hauling as may be necessary and then taking an ordinary ditch added about ten cents a foot for the ditch making a total of 19 or 20 cents, but call it 20 cents a foot as the cost of the services. The whole increment to the service charge is practically the four cents out of the 20 cents or about 20 per cent.

2325 COURT: How much is it, 20 cents a foot?

A. The ditch and pipe and laying of the pipe cost 20 cents a foot for inch and quarter wrought iron service.

COURT: What did you figure the average length of service?

A. I accepted what the company stated, 80 feet making the structural cost of the services $16.00.

Here the further hearing was adjourned until 9:30 A. M. tomorrow.

2326 Wednesday Forenoon Session.

AUGUST 16, 1911—at 9:30 a. m.

Counsel for the respective parties all present.
Testimony on part of defendants resumed as follows:

WILLIAM D. MARKS, continuing his direct examination, examined by Mr. Brennan, testified:

Q. We were discussing on last evening, Professor Marks, at the adjournment, the subject of residual depreciation as shown in your report. If I am informed correctly, you have taken up that subject at some length at page 77 of your report, section 94. I wish you would state in a general way, and yet in some detail, your method of computing res*i*dual depreciation.

A. A gas works may be treated in two ways: the repairs on it may be deferred as long as possible, or the repairs on it may be kept up as thoroughly as possible. In the first case, the diminution in the value of the works results from depreciation without any abatement of this depreciation by reason of repairs. In the second case the depreciation which is natural to all works is abated by repairs made as thoroughly and as promptly as possible. These thorough and prompt repairs keep the works in good working order and efficient, and to all outward appearances, in most cases, as good as new; nevertheless, there still remains what I have called residual depreciation. I have tried to explain that by taking the case of a man who is taking the utmost care of himself and whose health is perfect, and yet who is growing old. For all practical purposes an old man may be and frequently is as useful or even may be more useful than a young man, and yet we all know that the end of his wearing power, his usefulness in work is approaching;
2327 and the residual depre*pre*ciation is the depreciation which repairs cannot cure. In taking it up in the case of these works I have assumed that so far as the buildings and the useful apparatus is concerned, the repairs are thorough and complete, and yet the end of this apparatus and the end of these buildings is approaching. By taking up the plant, as you will see in this report, building by building, and the machinery item by item, and by using my best judgment resulting from experience, and depreciating these buildings and this machinery as it stands before you today, I get two values: The first value is the structural cost—when I say structural cost, I mean real money spent by the Company for the purpose of erecting these buildings and of bringing together in place this gas apparatus. So far as I am able I have, in getting the structural cost, held myself down to the actual facts. There is no qualification, no condition that can be avoided that is not avoided in attempting to get the structural cost. To repeat, the structural cost is the real money spent by the Company itself at the time and under the conditions when the buildings were built and the apparatus purchased and put in place. There is no question of replacement value, there is no question of reduplication value, there is no question of any theory whatsoever. The structural cost is as near as I can get to the

real cost of these works as though I were to step on the street and seeing a horse I liked, go down in my pockets and bring up $150 and pay $150 for the horse; it is the same with the buildings. Now with regard to present value. The present value is a more uncertain quantity. To get the structural cost most accurately, I would say that the books are the best evidence, provided they have been kept properly and are properly interpreted; always the books
2328 are the *the* best evidence for the structural cost. When you come to the matter of the present value, then you have a matter in which the honest convictions of experienced men widely differ. There are three ways in which works depreciate. Physical decay, as I have called it, is called in England and in the published reports of English works, wear and tear. Then there is the question of obsolescence. The progress in the manufacture of gas, that is, in the art is, compared with many other arts, rather slow. At the same time there is and has been, particularly of late years, a good deal of progress in the direction of high economy, and in order to get the best economy it is necessary, if not to vary the principle, at least to vary the methods of applying the principles concerned in the manufacture of gas. Inadequacy, the third factor in depreciation, is a growing factor. The plant grows inadequate as the community grows larger; and this inadequacy is to be covered by the enlargement of the works—sometimes by means of additional apparatus, sometimes by means of larger apparatus. Now, there are three factors acting on the works to depreciate its value, each one giving what might be called a life to the particular building or piece of apparatus or pipe; and whichever factor gives the shortest life, is the one to be used. If wear and tear or physical decay for a certain machine would give it a life of twenty-five years, and inadequacy a life of twenty years, and obsolescence a life of fifteen years, we will have to ignore the twenty year and the twenty-five year, and use only the fifteen year for obsolescence as the measure of its actual depreciation. I have stated in my report at the outset that it would be impossible and insincere to state that the art of depreciation
2329 could be reduced to a science of rigid rules; it can not be. Depreciation of these works, to the best of my judgment, amount on the whole—allowing also for the appreciation of the land from $36,000 to $100,000—to about $300,299. Now the records of this Company in one of its exhibits show that since the Company started they have had about 4,400,000,000 sales of gas, and still further back of that an unknown quantity of which the last year was about 43,000,000 and the period in the neighborhood of twenty years. I have not been able to learn the history of this Company, but have been told in a vague way it started about 1868 and became organized, or crystallized in about 1875. So that I have taken in round figures as the probable total sales from the beginning about five billion cubic feet, and dividing this into 299,000 gives me about six cents per thousand cubic feet as a depreciation which good repairs—and the works are in good repairs—have not been able to cure. Now I wish to say that when I speak of six cents as being the residual depreciation per thousand cubic feet I am forcing a relation between the sales of gas and the depreciation which has no rational,

no practical connection. The depreciation is based upon the time elapsing and upon the value of the apparatus, buildings or plant, and therefore, as you see, is not directly connected with the sales of gas or the output of the plant. But as it is necessary in ordinary business to protect the company, having found the lump sum of residual depreciation, it seems proper to add about six cents to every thousand cubic feet and put it in the cost of gas. Now I had occasion to make a very long investigation in Massachusetts in a somewhat different field, in regard to depreciation per thousand
2330 cubic feet, and I found that the depreciation went down, growing smaller and smaller in quantity per unit of sales as the number of units of sales in each year increased. In other words, this six cents per thousand cubic feet which I have obtained is the average depreciation. Going back toward the middle of the period which is included, at the early part of this period, the depreciation per thousand cubic feet was very much higher than six cents per thousand cubic feet, and in new works is sometimes very high indeed at the outset, and along towards the present date it has grown lower than six cents rather slow, so that in putting in this six cents residual depreciation, I have put in a quantity which in my opinion, and depending entirely in the case of others on your reliance, on my experience and judgment, is considerably over rather than under the actual residual depreciation occurring in the year 1910.

Q. Now, you use the figure six cents per thousand cubic feet of gas sold as representing the amount charged off for depreciation, that is in round numbers, in your report at page 78, you use the exact figures as 5.98 cents?

A. I do, and for the reason which I have just explained, that I do not claim decimal accuracy at all for my results.

Q. In valuing the real estate as you have in this report, at $100,000 was that your independent judgment of the value of the real estate or was it based upon information which you received?

A. Upon information which I received. I know nothing about the value of your real estate.

Q. How did you happen to adopt in round numbers $100,000 as representing the value of the real estate of the Des Moines Gas Company?

2331 A. I think I heard General Byers say to you that a certain man in whom he had great confidence said $100,000 was about right.

Q. Now before I forget it, I want to ask you a little more in detail in respect to the unit prices and the cost of cast iron mains in Des Moines, I want to ask you, Professor, whether or not the prices which you have used in your report are based entirely upon your experience in the city of Buffalo or the city of Cleveland, or are there other factors which enter into the prices which you have used in Des Moines, if so, please state just what you considered in that connection?

A. Again in the matter of prices the question of experience and judgment comes up. In attempting to obtain the structural cost of the street mains here, it was necessary for me to gain a knowledge of the average cost of work covering in a general way your system of

street mains. From the records of the trial between the Capital City Gas Light Company and Des Moines in 1894, I found at that time that your best authority, William Henry White, so far as I personally knew, the people concerned gave a list of cost of laying mains in the streets of Des Moines that coincided very closely with the prices per lineal foot which I had obtained and graphically laid out in the blue print which I handed to you yesterday based on Buffalo figures in 1907. In the year 1904 I found amongst my *my* papers a memorandum of the cost of laying mains in the city of Cleveland, whose soil and conditions resemble yours very closely, and I found that this list of prices sworn to by Mr. Beardsley, if I remember rightly, for Cleveland, coincided very closely with the rates and graphical diagram for Buffalo. In both cases I found that the price for the four inch and six inch mains which form the bulk of
2332 your system *are* fixed by Mr. White in 1894 and Beardsley in 1904, was somewhat less than the price per lineal foot which I had obtained in Buffalo, and feeling it necessary to always be on the safe and liberal side in so uncertain a matter as an appraisement, I took the Buffalo scale and used it as giving the larger results for Des Moines than had been claimed by Mr. William Henry White, or had been claimed in the case of Cleveland by Mr. Beardsley, giving a larger and higher appraisement of the street mains than would have resulted from either Beardsley's prices or William Henry White's prices, and also what I was desirous of getting, not the price of today in 1910, but the average price during a period ranging from 1894 up to 1910, the money, the real money probably paid out by this company for its underground system.

Q. Now with respect to your unit prices for productive labor and materials entering into the building connected with the manufacturing plant, what basis did you have for using the prices you have used in your report?

A. Well, in Cleveland I was obliged to begin from the ground up in regard to each——

Mr. GUERNSEY: I beg your pardon I do not believe the question is about Cleveland, and I submit we will get along faster if we confine ourselves to Des Moines.

A. I was obliged to begin from the ground up in Cleveland and obtain there the prices of 1910, both for labor and for materia', and I again compared my Cleveland prices with such prices as I could get here in Des Moines, and I concluded that the results would be correct enough if I used my Cleveland unit prices, for instance for brick. Taking the matter of brick, for instance, I figured
2333 this way: Knowing that the mud brick was very cheap and far below eight dollars, and that the hard burnt red stock brick used in other parts here probably cost a little more than eight dollars per thousand; I again added four dollars a thousand for brick layers, that is about forty cents a hundred, and a brick layer is supposed to do thirteen hundred or fourteen hundred brick a day in factory or warehouse work if he is left to his own way, although in large walls an active brick layer has been known to throw in three thousand brick a day and put them in good enough shape for ware-

house and factory work. Fourteen hundred brick a day was what I took, cutting it in two, and that gave me twelve dollars. I find that your lime here in small quantities is seventy-five cents a barrel, and in large quantities one might be getting it somewhat less; and the sand, in trying to dig the foundations of the works there they had to dig out a lot of sand; so you see sand is very cheap and everywhere along the banks of the river here. So I added a dollar for the lime and sand, making thirteen dollars. Well the contractor ought to have some profit, so I added three dollars contractor's profit, making sixteen dollars. Then as he had to put in scaffolding I added the customary cost of that, which is about one dollar per thousand cubic feet, if the scaffolding is new and has never been used before. But in this case, as in all cases, I assumed the conditions most favorable to the company, which is $16 a thousand for brick and $1 extra for scaffolding. I presume if you will average over the mud brick with the hard red stock brick which *which* I heard called shale brick here, that $16 to $17 is about what you can figure the brick work having cost here. That is one of the units I obtained.

2334 Q. You spoke about securing some information from local people did you talk with persons who have been engaged in constructing buildings in the city of Des Moines?

A. I was largely guided or rather confirmed in the figures which I have obtained here by a conversation with an outside contractor who is building this bridge over here; I can't recall his name, who appeared to me very intelligent, and who shipped in his material most of it from the outside, buying it in the best market, and by the information of a Mr. King—that is all hearsay—who I had been told dug up most of the streets.

Q. Do you refer to Mr. Wheeler of the Wheeler Construction Company?

A. Yes, that is his name.

Q. Now turning to Section 7, page 13, of your report, Professor Marks, you first have a description here of house #1-A and B erected in 1892, with a description of the building, and under the heading structural cost we find the contract price $6,904.92, to which you add overhead charges of twelve and one half per cent and then find the total structural cost $7,768.04 from which you have deducted depreciation for 18 years, 25 per cent, $1,942.01, the $5,826.03 represents the present value of that building, does it?

A. It does.

Q. Now in your judgment, Professor Marks, does that sum represent the present value of that building for any purpose?

A. It does not. It represents the present value of that business for the purpose of making gas. If you will allow me to add to that—throughout every part of this work the value for the purpose for which these buildings and this apparatus is intended is a value which I faithfully tried to obtain. Taking for instance the ma-

2335 chinery; we all know that the moment machinery is bought and put in use it- salability cuts it right down to fifty per cent of its price new; it is second-hand. I have done no such thing

as that in connection with the machinery or anything of that sort. I have always tried to rate the value for the purpose for which it is intended.

Q. Is the sum $5,826.03 does that represent in your judgment the true value of that property for the purpose for which it is used?

A. At present, yes.

The MASTER: What do you fix the life of the building at?

A. In this case about fifty years. I summarize the system of depreciation——

The MASTER: I wanted to know what you fixed it at?

A. Fifty years.

The MASTER: How old was it?

A. It is 18 years old.

The MASTER: Did you examine the foundation?

A. I could not examine the foundation without digging, except what I saw.

The MASTER: The length of life very much depends on the life of the foundation?

A. Yes.

Q. Now, you take up Section 8, which contains purifying house, and you have used as the contract price $16,835, to which you have added as overhead charges 12½ per cent or $2,108.37 and have deducted as depreciation $6,440 your present value as found on page 14 in your report?

A. It is $13,819.

2336 Q. In your judgment does that represent the true present value of the contents of the purifying house described at page 14 of your report for the purpose for which it is being used?

A. It does.

Q. Now, each and every one of the items referred to in your report makes a cross reference to the inventory?

A. It has.

Q. And that is Exhibit 15?

A. Yes.

Q. And in each and every case in this report where you have fixed the present value of the property referred to at the prices and values which you have used, are they in your judgment the true present value of the property for the purpose for which it is being used?

A. Yes.

The MASTER: Right there I want to understand one thing as to Section 8. You get an average annual depreciation of $147.

A. Yes.

The MASTER: Now, how do you get that, by dividing 17 into the 6440?

A. Depreciation, 17 years immediately above it, dividing that into the total depreciation, 6440.

The MASTER: Which would be more than $147?

A. I will multiply that out. There is such a large number of those computations, I forget how did each one of them, I have to go over it. Will you allow me to bring the memorandum from my room?

The MASTER: Yes. I wanted to know whether you figured any interest on this?

A. There is no interest on it at all, straight depreciation.

2337 The MASTER: 34 per cent would be pretty near right—17 into 6440—it would be a good deal more than $147?

A. Yes, the fact of the matter, there has been something about the obsolete steam hydraulic elevator in there. I will get that this afternoon and bring it out exactly.

Q. At page 58 of your report, the recapitulation being a part of section 76, that shows the total present value of all mains in the system, 183.98 miles in length, $652,947. Does that represent the total cost of street mains from the beginning of the first gas company up to the date of your report?

A. On the top of page 58 $652,947 gives you the total present value of the mains.

Q. Are there any overhead charges included there?

A. Above cost of productive labor and raw material there are two charges made in there; one of ten per cent for undistributed charges and another 15 per cent to allow for contractor's profits if the work is done on a large scale, and to allow for unavoidable losses if the work is done in an interrupted way by the company itself.

Q. Well, in your judgment, Professor, did $652,947 represent the true value of the street mains in the distribution system of the Des Moines Gas Company as shown in this report?

A. It does.

The MASTER: I thought there were four mains in the river?

A. There is one 24 inch main and there is two 16 inch mains, aggregating 1300 feet, and one 8 inch main.

Q. Now, commencing at page 72 of your report, you show a summary of the tangible property of the Des Moines Gas Company up to November 1, 1910; why do you use November 1, 1910, as the end of the period used by you?

2338 A. It was the date of Exhibit 15 furnished by the Gas Company as the list of its property.

Q. Now, at page 75 of your report, Exhibit 23, you have a recapitulation of your appraisals up to November 1, 1910, and you have itemized the buildings and contents and other property and deduced as the structural cost the sum of $1,700,215, and in the other column under present value, you fix the present value of the tangible property of the Des Moines Gas Company at $1,410,087. Now I wish you would tell the Master whether or not in your judgment the amount which you have used as representing the present value of the property of the Des Moines Gas Company is its true present value for the purpose for which it is being used on the first day of January, 1911?

A. On the 1st day of November, 1910, I think it is.

Q. You mean the property that was in use by the Des Moines Gas Company on the 1st day of November, 1910?

A. Yes, that was the date of the list furnished me by the Company.

Q. Now, at page 76 you have a summary of rejected tangible

property claimed by the Des Moines Gas Company and not allowed by appraisal in rate cases; now I wish you would explain to the Master why you considered the items which you have rejected as being properly rejected in an appraisement of this character?

Objected to on part of complainant as calling for the conclusion of the witness on a question of law and therefore incompetent.

A. The pavements claimed by the company, according to the figures given by the city authorities, amounted to $204,994. These pavements were put down by the taxpayers and the city authorities and not by the company. The cost of lifting pavements off the mains $28,242 was rejected by me, because, except for re-
2339 pairs or replacements, which would properly be charged up in most instances to repairs. It is my opinion these pavements had not been lifted at all. Line pot drips, $3,000, is a small quantity which is included in the rates given resulting in $652,000 total. The steam and street railway crossings $636, is also included in the $652,000. The pavements for services laid under street paving $35,441. is rejected for the same reason; that is, while there are pavements I presume lifted for the purpose of putting in services, the proportion of them is very small, and in the majority of cases these pavements are lifted for the purpose of repairs and charged to repairs and consequently to the cost of gas. The taking up of these pavements for services is left out for the same reasons. This gives a total of rejected claims of $280,081.

Q. Now at page 58 of your report in the recapitulation shown thereon you give as the total present value of mains $652,947. and below the figures to which I have called your attention, you say that the total cost of street mains from the beginning of the first Gas Company to date, appears to be recorded in the company's books as $647,290.35; so that your estimate of the value of the street mains is in excess of that shown upon the company's books, if you have given the figures correctly of the condition of the books?

A. I should make a correction in regard to that last figure, $647,-290. Yesterday evening the city's accountants told me that in further investigating the books of the company they had found that $5,000 or about that of the cost of sinking the mains in the bed of the river had been charged to operating expense and not to capital
account, so that that sum as reported from the books should
2340 not be $647,000 but should be about $652,000. I ought to say at once that I utterly disclaim, except as a matter of accident, any such accuracy as would appear from the books and the estimate.

Q. What I want to know is whether or not your present estimate of the present value of the street mains $647,000 was arrived at through the use of the books of the Company by you in connection with your investigation?

A. I had never seen or heard a figure from the books until my estimates were completed.

Q. So that it is absolutely independent from the books and records of the Company?

A. Entirely independent.

Q. I notice at page 98 of your report Exhibit 23, you have given some consideration to the subject of going value. I wish you would please state to the Master whether by so doing you considered it a proper subject in connection with a rate case?

Objected to as being incompetent.

The MASTER: It strikes me that is a law question.

Mr. BRENNAN: The only purpose for which I asked the question is to show, by introducing this subject into this report that he has not admitted thereby that it is a proper item to be considered in connection with the rate making cases and neither does the city admit it.

A. Going value as defined there should not be used in rate cases; it was introduced for another reason.

Q. What purpose did you have for introducing the subject in your report.

Same objection as last above made, and it is wholly irrelevant and immaterial.

2341 A. To show that the market value of a proper capitalization would not be injured, but on the contrary would be somewhat enhanced by the fixing of the rate at 90 cents.

Q. Now that suggests to my mind this question, Professor: In computing the cost of manufacturing and distributing gas in the city of Des Moines, and the earnings of the company, based upon a 90 cent rate, what have you used as representing a reasonable return on the investment, what per cent.

A. Six per cent.

Q. And in this report at page 98, you have taken the excess profits as I understand it, derived from the earnings over and above the six per cent return?

A. 86 cents, yes.

Q. Now if you shall take the amount of profit over and above the six per cent which you have computed as a reasonable return upon the investment and add it to the six per cent, what rate of return will be afforded the Des Moines Gas Company on the 90 cent rate as shown in your report?

A. About 7.4 per cent on the present value and the working capital added together.

Q. On last year's sales?

A. For the year 1910.

Q. Does that profit 7.4 per cent in the investment in your report accrue to the Des Moines Gas Company after taking care of operating expenses, overhead charges, depreciation and taxes?

A. That is it. Pardon me for correcting a little bit—also allowing six cents as a fund which they have never yet created to take care of what I have called residual depreciation, after making all the repairs in the most thorough manner possible.

The MASTER: That is, six cents per thousand cubic feet of
2342 gas?

A. Yes.

Q. The MASTER: That makes your gas actually cost 69⅓ cents delivered to the consumer?

A. 69⅓ cents.

Q. I wish you would explain at some length your method of capitalizing excess profit, what choice the company would have with respect thereto, whether they should add it to the six per cent and declare dividends thereon or whether it would enhance the value of the stock in the investment?

Objected to as being purely argumentative and irrelevant. Everybody knows it is a matter of common knowledge that you can do what you please with your earnings.

A. It is purely a matter of opinion, I was going to say, amongst the investors as to whether six or seven and a half per cent is what they should demand on an investment in a gas company. The Supreme Court has fixed it at six per cent. If six per cent is satisfactory, there is a margin left of four cents of extra profit per thousand, because 86 from 90 leaves 4. I am talking in round figures, and as there was 528 million cubic feet of gas sold that year, I would multiply 4 cents by 528 million cubic feet and that gives me $21,135, a lump sum of extra profit for the year 1910. If I capitalize that at six per cent it gives me as the capital $352,250, which at six per cent will produce $21,135. If now I add the present depreciated value $1,401,000. working capital, $68,000. going value, as I call it, which is simply capitalized extra earnings, I get a total market value of $1,821,000. I assume what is perfectly natural in this matter,
2343 that the company issue stock for all the money which it got or spent, and that is the structural cost of the concern, or about $1,700,000. and if all the stock is worth in the market $1,821,000 it will put each one hundred dollar share of stock at $103. Now that boils itself down to a six per cent investment worth $103 a share; on the other hand, if the investor insists on seven and a half per cent, or 7.4 per cent you bring the stock at once down to par by that insistence and the rate of profit on it to 7½ per cent, speaking in round figures. In that case there is no going value because if 7½ per cent is right then there is no extra profit, and in fact if the city council had fixed on any given rate of profit and then fixed the price which actually brought that profit to this company which would be theoretically just and right, there would be no going value; in fact there is no going value in this rate case at all, and there shouldn't be.

Q. So that your method of computation is to give to the company the choice of returning in the first instance of this 7.4 per cent on the true present value of its investment or to use the excessive profit of four cents per thousand cubic feet of all gas in increasing or enhancing the value of the stock.

A. Yes.

Q. Now, Professor Marks, something has been said in this case that the company has paid some nonresident officer the sum of $10,000 which has been charged into operating expenses, and I

presume in arriving at the cost of gas you have included that $10,000 as being properly there in the operating account, is that true?

A. No, but I have included the charge of $10,000 in the cost of gas.

Q. You have assumed for the purpose of this report that
2344 the $10,000 is in there?

A. I have allowed the $10,000 to remain there.

Q. Now if we shall deduct the $10,000 from the cost of making gas, what would be the rate of the return on the investment based upon the sales for the year 1910?

A. If we consider the $10,000 and the 528 million cubic feet together, it is very nearly two cents per thousand cubic feet if we take off the $10,000. The cost which I got originally was 69.33 inclusive of depreciation. Taking off 2 cents I get 67.33. The investment in present value and working capital is 2.78 per thousand cubic feet and the profit on each thousand cubic feet of gas is 90 cents less 67.33 or 22.67 cents, which gives me 8.1 or in round figures eight per cent on 2.78, the investment due to present value and to working capital in the thousand cubic feet of gas.

Q. Will you tell us, say for the year 1910, if we shall deduct $15,000 representing the amount paid nonresident officers, and $5,000 for legal expenses, if we deduct $15,000 from the cost of making gas for the year 1910, will you please state to the Master what it cost the company to manufacture and distribute gas in that year?

A. If the Master will permit me to say, $5,000 is about one cent per thousand cubic feet; so the first $10,000 is two cents off of the cost of 69.33 and the next $5,000 is another cent off so that you have 66.33 as the cost of taking off $10,000 and then $5,000. It might be a little more than 66.33; between that and 67 cents.

Q. What I was trying to find out, do you assume 69 cents in round numbers was the cost of manufacturing gas in the year 1910 or did that represent the average cost?

2345 A. The average cost for five years is given in my report in considerable detail in section 96, page 82, and the average cost for the period of 5 years is given on page 84, at the bottom of the page, for making and distributing and measuring gas, collecting bills, making repairs, allowing for residual depreciation, taxes, legitimate expenses, donations, insurance, bad debts, and sundry small expenses, as 69.33 cents; this covering a period of five years.

Q. What I would like to have you do if you can conveniently is to take for instance the amount of gas sold by the company in the year 1910 and the amount of revenue derived therefrom, and then add to the net receipts $15,000 and thn tell us what it actual- cost them to sell gas in the city of Des Moines in the year 1910 and assuming that the books show for the purpose of the question that the net receipts were in round numbers $186,000?

A. I beg your pardon—if I take the reecipts and divide by the amount of gas I get the average price which is received; if I take the operating expense and divide by the amount of gas I take the

cost which is paid. As this question reads I am requested to deduce the cost of gas from the receipts for gas.

Q. What I wanted to have you do is this: The company's books you may assume for the purpose of this question, show that they received net in the year 1910, $186,000. Now there is $15,000 that has been used in paying legal expense and in paying salaries to non-resident officers; so that if we add $15,000 to the $186,000 we then have $201,000 net receipts. Now what we wanted to know if you could, by knowing the net receipts, and the amount of gas sold, considering the expenses which were charged off, whether you could give us the cost to the company of selling gas in Des Moines
2346 in that year?

A. The price to the consumer you wish?

A. Yes.

Q. Then I divide by 528,375. It does not divide out right. I should like to go into the matter if you will allow me.

Q. All right.

A. On page 85 you will find the collections for the year ending December 31, 1910, were $538,893. Now immediately opposite that to the left hand side you will observe that the sales in cubic feet are given 531,991,054 cubic feet. In this case they have given you not only the sales in the city of Des Moines but also as I understand it the sales in the village of Valley Junction, and it is the only place where it appears. Ordinarily I have somewhat incorrectly used 528,375,000 cubic feet of sales in the city of Des Moines in my computations of cost. I have done this as I have uniformly done throughout my whole report in a spirit of liberality towards the company to throw any doubt there might be in the matter in their favor. Now returning again to the $538,893. collected December 31, 1910, you wish me to add $15,000 more to that?

Q. What I want to get, if we deduct this $10,000 and the $5,000 what I want to get at first, is what it would cost to consumers of Des Moines for gas in the year 1910; what they paid for gas?

A. You are asking me for 1910, not for the five years?

Q. For the year 1910.

A. Computing it roughly, it may be slightly wrong, $1.01.29 on an average in the year ending December 31, 1910.

Q. Now the return which you have computed to the company on the basis of the ordinance in controversy, as I understand you, is based entirely upon the sales for the year 1910 and does not
2347 take into account any future sales?

A. It does not.

Q. What is the effect, if you know, upon the business, especially the gas business due to a reduction in the rate; that is to say whether or not business is stimulated or retarded?

A. Business is increased by a reduction in the price, and by that I mean the sales per capita of population is increased by a reduction in the price in almost certain regularity.

Q. Have you made any observation with respect to the results of the reduction in the price of gas in other cities?

A. I have made extremely careful studies of the results of reduction in the price of gas, beginning as far back as the year 1900 in a numerical way and using as the basis of my study the recorded facts in regard to the gas light companies of Massachusetts, that is all the various cities of Massachusetts, following them up at intervals carefully and in detail.

Q. Are these tables referred to in your report?

A. On page 91 I have given the results of investigation of all of the towns and cities in Massachusetts for the year 1910 and on page 94 I have given the relation of the price of gas to the per capita sales of gas for the years 1901, 1907 and 1910, showing average results from the various gas companies grouped under the prices at which they sell gas, beginning with $2.25 and running down as low as 80¢ per thousand cubic feet.

Q. The table to which you have just called attention shows when the price of gas was $2 per thousand cubic feet in 1901, the sales per capita were 584, and the sales per capita for 1910 were 988 and the average sales per capita for that period was 910. Now going to the bottom of your table where the price of gas was 80¢ per
2348 thousand the sales per capita increased to 5,760, is that correct?

A. Yes. That is in the year 1910. You will note, I will call your attention to the fact that the price of gas in 1901 was as high as $2.25. When you get to 1907 the number selling gas at $2.25 became so inconsiderable it was not worth while putting it in; that was equally true of 1910. The whole trend and drift and everything goes slow in Massachusetts, but is from a high price down to a lower price, and it is only in 1910 that any noticable number of Massachusetts gas companies have reached 90 cents and 80 cents and the very large returns that resulted from selling at 90 cents and 80 cents.

Q. Now assume that at the end of the year, we will say one year after the ordinance was in force, the one in controversy, that the sales of gas would amount to say 600 millions, about what would be the rate of return based upon your valuation in this case?

A. About ten per cent with gas at ninety cents. I obtain that in this way: it is only a rough, rapid approximation, which will make matters clear to you. The present gas company is turning out about 531 million feet annually and it is drifting on towards 600 million annually. I don't know what it is to-day; but the thorough business management—I hope Mr. Haines is not here—that Mr. Haines gives this concern, the way in which as a business man he has pushed it and has made your consumption per capita quite large, unusual under the conditions of dollar gas, showing as I said before, admirable management, I have no doubt that impetus will carry it right on to 600 million in a very short time. When you get to 600 million, all that will happen will be they will use some more oil and some more coke and some more purifying material; but speaking generally they will have no more men at work, they will
2349 have to put in no more apparatus than they have to-day; and an odd thing will happen, which is very rarely thought of.

While the additional cost of gas per thousand becomes about 25 cents as shown on page 96 of my report, the increase in the sales from 528 million to 600 million will reduce the investment per thousand cubic feet of sales so that this increase of sales works both ways under existing conditions; it cuts the cost of gas down and the gas to consumers down to about 64 cents, because all there is added for each thousand is 25 cents worth of material, oil, coke, etc., at the same time it cuts the investment per thousand cubic feet down to about two fifty and 64 cents cost taken away from 90 cents price, leaves about 26 cents which is profit on a thousand cubic feet of gas and also profit on about 2.50 investment; and it is a little over ten per cent that today these gentlemen could have for 600 million cubic feet.

Q. If the reduction in the price of gas shall stimulate the business beyond that, of course the profits will increase proportionately?

A. Yes; there is one point I ought to qualify and that is this: in my report I called attention to the fact that about three million cubic feet daily capacity sales was about all that was safe for them to carry. I called attention to the fact that their purifiers and possibly their holders would have to be increased when they got up to three million cubic feet or 600 million annual capacity. Now the moment they reach that point that they have to put in more investment in holders and purifiers and that sort of thing, why you then have again a larger investment that is perhaps temporarily even larger than 2.78 which I found to be the case with 528 million cubic feet annual sales. I am only talking now of going over 500 million cubic feet to 600 million cubic feet. This is not a case of
2350 going on indefinitely, like Mr. Hagenah's computation would lead you to believe.

Mr. GUERNSEY: We move to strike the answer as grossly improper, not responsive and argumentative.

Mr. BYERS: We except to counsel's remarks *of* grossly improper.

The MASTER: Would it not also likely increase the mains' services and meters?

A. They would have to increase the mains some if it went up beyond 600 million.

The MASTER: And services and meters?

A. Not necessarily services and meters because of the fact that consumers seem to have just about so much money in their mind that they can spend for gas, and if you reduce the price of gas in a community the family will move up to the use of it to the sum they will stand and the increase comes right along up in that way. The addition in new meters is comparatively trivial as well as in new services. I was referring more particularly to the large apparatus for storing gas, the holders and from the fact that they ought to have another set of purifiers or a bigger set as soon as they got up to three million a day.

Q. I was going to tell you to tell the Master what the experience was in New York City after the case had gone to the Supreme Court

of the United States and after they commenced offering it under the new ordinance.

Objected to as being incompetent.

The MASTER: His judgment, observation and experience is competent, but what is done in this place or that place and another raises a collateral question.

Mr. BRENNAN: I was going to have him tell in a general way after the price was reduced in New York how it affected
2351 the sales.

Same objection as last above made.

A. In New York City and the Island of Manhattan it resulted in increased sales and increased profits, causing the company after a year's trial to decide to go on at 80 cents and not ask the court to decide it.

The complainant moves to strike the last part of the answer as hearsay and incompetent.

Q. What is the fact as to whether or not the company did renew its application in New York to have the rate fixed in the ordinance set aside?

Objected to on part of complainant as being incompetent.

A. It did not apply to have the 80 cents set aside.

Q. I wish you would refer to the tables in your report commencing at page 91 and explain a little more in detail, if you care to, with respect to the experience in Massachusetts due to the reduction in the price of gas?

A. The tables I am speaking of are based entirely on the practical results to be gotten in the state of Massachusetts as reported by the gas companies to the Massachusetts Gas and Electric Light Commission each year, and these reports go back as far as 1888, but I have only referred to them as far back as 1901. Beginning, however, with 1910, and working backwards, I find that the cities of Boston, Lynn, Worcester have gas ranging from a price of 77.8 cents to 80.5 cents and that the average sales per capita under these conditions are 5760 cubic feet. The cities of Charlestown, Cambridge, Fall River, East Boston Laurens, Lowell, New Bedford and Springfield have gas at a price ranging from 85.4 up to 92.7 and the average sale per capita in those cities at these prices is
2352 4,106 cubic feet. The cities of Dedham, Haverhill, Milton, Newton, North Adams, Revere and Taunton sell gas at a price from 97.7 cents up to $1.04 and the average sales per capita are 4,007 cubic feet. The cities of Adams, Brockton, Fitchburg and Salem sell gas at prices ranging from $1.10 to $1.14 and the average sales per capita are 2,608 cubic feet. The cities of Arlington, Foxboro, Dover, Blackstone, Chicapee, Williamstown, North Hampton and Pittsfield sell gas at prices ranging from $1.16 to $1.33 and the average sales per capita are 2,220 cubic feet. The cities of Athol, Quincy, Clinton, Danvers, East Hampton, Framingham, Leomin-

ster, Barre, Woburn, Norwood, Spencer and Webster sell gas at prices ranging from $1.41 to $1.62 and the average sales per capita are 1,341 cubic feet. The cities of Emsboro, Greenfield, Marblehead and Plymouth sell gas at prices ranging from $1.63 to $1.84 and the average sales per capita are 988 cubic feet. The cities of Nantucket, Gardner, Ipswich, and Stoneham sell gas at prices ranging from $1.88 to $2.06 and the average sales per capita are 614 cubic feet. Referring now to the year- 1901 and 1907 as well as the year 1910 for which I have just given the details I find also that there is a steady growth in the sales per capita of gas due to the growth of apparatus with which the gas is consumed—I refer more particularly to heating and cooking purposes—and looking over the results for instance in the case of $1 gas in the state of Massachusetts I find that in 1901 the average sales per capita of $1 gas was 2393 cubic feet and in 1907 3824 cubic feet and in 1910, 4007 cubic feet, showing a steady growth at a constant price of one dollar, just such a steady growth as you have found very markedly shown here, owing to the excellent business management of which I have already spoken on the part of Mr. Haines.

2353 Now if we take the sales per capita in 1910, 4007, and subtract the sales per capita 2393 for 1901, we have a difference of 1614 cubic feet occurring in the space of nine years, or an average annual increase in the sales per capita of $1 gas of 179 or 180 cubic feet. In addition to that referring again to the same page, 94, we find an increase in the sales of gas which appears to come from a reduction in the price. Now, where the price of gas is reduced when it is higher than about $1.25 the results seem to be very irregular; but when you get down in the neighborhood of a dollar, the gas changes its relation to the community and is no longer a luxury, but becomes a sort of a commodity which everybody expects to use for cooking and for the purpose of occasionally heating, and then the response to reductions in prices becomes very regular as compared with anything that it is when it was a luxury; and you can expect for each cent reduction in Massachusetts—of course I don't know what it is elsewhere—an increase in the sales per capita ranging all the way from 15 to 50 cubic feet; but always an increase every time you put down the price of gas.

The MASTER: In other words, it has a tendency to make them a little more extravagant?

A. It seems as if every man had a lump sum he was willing to spend for gas; if the gas is high he cuts it down; if it is low, he lets it go until he gets up to that sum.

The MASTER: He gets it anyhow?

A. Yes, he spends it anyhow.

Q. You said something a while ago about your reasons for not considering this going value in connection with a rate case. This thought occurred to my mind, if a man in the ordinary affairs of life and business was permitted or thought it prudent, rather,

2354 to add to the cost of a commodity he had for sale what he might term the value of his going concern, would he be able to get anywhere in the field of competition on that basis?

Objected to as wholly argumentative, irrelevant and immaterial.

A. He would probably not be able to succeed in a competitive business if he added his going value as a basis to the price.

The MASTER: Would not that depend a little on the business?

A. Nothing except in the case of patents.

Mr. BRENNAN: The defendants now offer in evidence defendants' Exhibit 23.

Mr. GUERNSEY: Objected to because it is incompetent and because it is based upon hearsay and not based upon the experience of the witness or the conditions here in Des Moines, and the same objection is made to each part of it. I want to make a separate objection to each part of it and as to each section of it on account of the quotations contained therein.

Q. I want to ask you in reference to the item of $68,000 which you allow for working capital. Upon what basis did you compute working capital and arrive at the sum of $68,000 as the proper amount for that purpose?

A. On the basis of about 13 cents per thousand cubic feet of annual sales, giving about $69,000.

Q. And the cost of gas includes this amount as working capital as computed by you?

A. It does.

Q. Do you refer in your report to the 13 cents which you have computed as the basis for your working capital?

2355 A. I do.

Q. Please state where it is referred to in your report?

A. On page 81 I go into the subject of working capital, both when construction is going on and also when operation is going on, calling attention to the distinction between working capital required during construction and the working capital which may be required during operation.

Q. Is the 13 cents you use simply an arbitrary figure, or is it one you use based upon your experience as a consulting engineer?

A. It is empirical constant, and something the result of considerable experience, modified by my judgment as to what would be liberal.

Q. Was the subject treated in the consolidated gas case with which you were connected by Judge Huff?

Objected to on part of complainants as being hearsay and argumentative.

A. It was. Judge Huff didn't pay very much attention to the testimony. He said a million dollars was enough and let it go at that on annual sales of about 14 million cubic feet of gas.

Q. Well, is it your judgment, Professor Marks, that 13 cents per thousand cubic feet of gas is all that should be allowed to the company to represent working capital?

A. Yes.

Cross-examination by N. Y. GUERNSEY, Esq.:

Q. Turning to page 14 of your report, which was referred to in your direct examination, can you tell us the theory on which you obtained the average annual depreciation there of $147.

A. The Master just asked me about that.

Q. I want to know, whether without looking it up you can
2356 tell us the theory on which you computed that?

A. I think it is a typographical error; it was computed and not used afterwards and overlooked in my final revision, simply because that method of obtaining annual depreciation, residual depreciation was abandoned.

Q. What was the method; I don't care for the figures, and I don't care whether you abandoned it or not; but I would like to have you tell me the method that was adopted to compute that?

A. The general method——

Q. No, I want the method so that we can apply it and compute it?

A. I think that is a typographical error.

Q. Give us the method that was adopted to compute what should be here.

A. I mean by that general method——

Q. I mean something so that we can compute it; not glittering generalities—let us get down to brass tacks.

A. That is what I want to do. There must be a general method in anything of this sort. The attempt that was made and abandoned was to find the annual depreciation in the case of each item, by finding the total depreciation and then dividing it by the number of years which that depreciation existed or was computed. But in cases of obsolescence—I have marked one obsolete here—I used my own judgment as to what sum ought to be put in, because in the case of obsolescence the annual depreciation disappeared. I will endeavor to explain that to you.

Q. Can you without referring to your notes tell us how to compute it?

A. Not further than the general method.

Q. Did you make the computation yourself?

A. In this case I did.

2357 Q. As to each one of those things?

A. It was abandoned.

Q. As to each one of the items that go into the plant you made the computation on that theory?

A. You mean the computation as to the annual depreciation. I did not, because it was abandoned. Nobody made it.

Q. How recently was it that it was abandoned, when did you make these figures?

A. Within a couple of weeks.

Q. You can't tell us now what the theory was?

A. I just told you.

Q. You can't tell us any more specifically than you have?

A. I shan't go into the English language any further trying to explain it to you.

Q. You usually qualify as a statistician as well as these various other things?

A. Very rarely.

Q. But also as a statistician?

A. Sometimes people call me statistician.

Q. You qualify as a statistician, don't you?

A. I don't recall that I ever did.

Q. Now, you were sincere in making this computation for Mr. Brennan of the amount which you had to deduct from your 69⅓ cents as the cost of gas, if we eliminate those two items aggregating about $15,000?

A. I did; I was taken by surprise.

Q. You thought you were doing it right?

A. Yes.

Q. There was an obvious error in your theory of computation, wasn't there?

2358 A. I don't know.

Q. In the theory of it wasn't there?

A. It was the elimination of $15,000——

Q. You remember the transaction. You were sincere in making this computation for Mr. Brennan of the amount which you had to deduct from your 69⅓ cents as the cost of gas if we eliminated those two items aggregating $15,000?

A. Why, of course?

Q. There was an obvious error in your theory, wasn't there?

A. Well, I was not aware there was; I don't think there was any theory connected with it.

Q. Your computation was based on some theory, wasn't it; tell us what the error was, I don't mean error in figures, I mean the underlying proposition you adopted in getting at that result?

A. You mean to tell me my figures are incorrect—I often slip up on the decimal.

Q. I am not splitting hair; I am getting at what underlies your computation; that was obviously wrong, wasn't it?

A. Certainly not.

Q. Your 69.33 was an average for five years?

A. Yes.

Q. You deducted this $15,000 which only occurred one year from your average of five years, didn't you, and got a result five times as big as it ought to be in your deduction?

A. I think I can make that clear to you.

Q. Go on and answer the question, if you please.

A. I certainly did not get a result five times too big, but I would be very glad to explain it to you if you wish to know.

Q. You are still satisfied that your compitation there was right and that this where you were dealing with the average five

2359 years and you took an expense of $15,000 which only occurred in one year, it was proper to deduct it from the average instead of spread it over the five years?

A. If you reduce it to terms cents per thousand cubic feet of gas if my figures are numerically correct, I am satisfied I was entirely right.

Q. The record here shows that the cost for 1910 in cents per thousand cubic feet, the year in which this expenditure occurred, was 66 cents and a fraction, and this amounted to about three cents, and that would make it 63 cents and a fraction?

A. You are wrong there. The cost was 69 and a fraction.

Q. You added to that your 6 cents that you had after you got your average?

A. Yes.

Q. The cost shown here by the record was 66.47, which appears from one of the exhibits here, complainant's Exhibit 24, as the operating cost of the company for the year 1910; now if you had taken $15,000 from that you would have reduced it three cents, roughly?

A. Yes.

Q. Would that have reduced your average for the five years three cents or one fifth of three cents?

A. I was asked about the price of gas——

Q. No, answer my question, please. Can't you answer that without referring to anything or making a computation?

A. No, because it is a catch question.

Q. It is a question that is plain and clear to you as a statistician?

A. It is.

Q. Will you answer it and tell us whether the reduction of the operating cost three cents for one year would reduce the
2360 average of five years operating costs, which includes this one, three cents or one-fifth of three cents?

A. I will as soon as I can look it up, the costs for those five years.

At this time an adjournment was taken until 1:30 p. m.

2361 1:30 P. M., WEDNESDAY, *August* 16, 1911.

WILLIAM D. MARKS being continued on cross-examination by N. T. Guernsey, Esq., testified as follows:

Q. Do you still think that the elimination of this item or these two items of about $15,000 in 1910 would reduce the average cost of making distributing and measuring gas, etc., from 63.33 cents about three cents?

A. Referring to page 83 of the report I find using the cash cost only, that is 6 cents less than the 69.33 I find that for 1910 we are given 65.30 while I use as an average 63.33 preferring to use an average of five years as being more nearly accurate. I would reduce the cost for the year ending December 31, 1910, which is given at 65.3 by about three cents, to 62.3 cash cost but there is no question of one third of an error or one fifth being divided out.

Q. Now let me repeat my question. I ask you whether you still think that the elimination of this $15,000 in the last year would reduce this average for the five years, 69.33 cents three cents. Now please answer that?

A. It will reduce it about three cents.

Q. You didn't make up these figures shown on your page 83 did you?

A. I did not. I obtained them from the city's accountants.

Q. Now take these figures that I will give you here that are in evidence Exhibit 24. You have taken on your page 83 the two months ending February 28th to begin with haven't you?

A. Yes, sir.

Q. Now taking figures over the same period that have been sworn to and are in evidence here at .7415 for that two months?

2362 A. Exhibit 24 two months, .7515 cents.

Q. Now for the twelve months ending February 28, 1907 which is your next period, take .6581. Then for the next succeeding twelve months .6401.

A. Ending February 29, 1908, is that?

Q. Yes. Then for the next twelve months .5961. For the next ten months ending December 31, 1909, which is the next period which you take as shown on this exhibit take .6256 and for the year ending December 31, 1910, take .6647 and tell us what the average is. Get at the average in the same way you got your average for the five years December 31, 1910?

A. I have not the data here to do that with.

Q. What do you want besides the figures?

A. The average for the year ending December 31, 1910—the total amount of sales for the five years preceding divided into the total amount of the operating expenses of those five years and is not the average of the averages above it.

Q. You took the total sales—well I can give you that from this same exhibit if you prefer to do that way?

A. If you give me the total sales for five years.

Q. For the two month period 59,059,182 cubic feet, the first two months' period. For the twelve months ending February 28, 1907, 38,892,656, for the twelve months ending February 29, 1898, 441,877,493, the next twelve months ending February 28, 1909, 465,970,133. For the ten months ending December 31, 1909, 404,-244,022, for the twelve months ending December 31, 1910, 531,-991,054. You want the total operating expense also as I understand.

A. If you please.

A. For the first two months' period $43,790.62. For the
2363 next twelve month period $255,967.82. The next period $282,801.70. The next period $277,745.76. For the ten months' period ending December 31, 1909, $252,914.90. For the twelve months' period ending December 31, 1910, $353,600.42.

A. I obtained for the amount of sales 2,292,034,540 cubic feet but I find on referring to the bottom of page 84 that I have there 2,292,034,290 instead of 540. I don't know but what I may have made some mistake in taking down your figures.

Mr. GUERNSEY: We get 2,292,034,540.

Mr. BRENNAN: That is what I get.

Q. There are two people that agree with you, and I think you can acceot that as O. K.

A. I obtained $1,466,821.22 as the amount of the cash operating expenses for the period of five years.

Mr. GUERNSEY: That checks.

A. In order to shorten the division I have taken 2,292,035 thousands. Do you wish me to carry it to the decimal, I find I am so very close to 64 cents, I could make it——

Q. Call it 63.99, that is what our figures are. Now then Professor, will you deduct from your operating expenses of the last year these two items which amount to $15,602 and tell us what this average is with those items deducted?

A. Using 531 millions?

Q. Use the same figures you had before except that you eliminate these items you eliminated in making your calculation this morning.

A. Dividing $15,602 by 531,991 thousands it amounts to 2.93 cents deduction.

COURT: That is only for one year, he wants you to do it for the five years.

Q. I asked you to deduct the $15,602 from the operating
2364 and then divide by your number of cubic feet.

A. Oh I never did such a thing.

Q. I didn't suppose you did because if you had you would not have testified the way you did this morning.

A. I think you misunderstood me.

Q. Will you please do that?

A. Acting as your computer I will.

Q. Acting as a witness. Deduct $15,602?

A. Deducting $15,602 from the total cash operating and then dividing by the total number of cubic feet of sales to get the average per cubic feet, I do this merely as your computer, I would not do such a thing as that.

Q. Well I inferred from what you said this morning you would not.

A. Subtracting $15,602 from $1,466,821.22 I obtain, $1,451,-219.22. What do you wish me to do with that?

Q. That is the gross operating for that five years' period less these two disputed items?

A. Yes, sir.

Q. Now will you divide that by the number of cubic feet of gas sold during that period, will that give you the average operating expenses per thousand of cubic feet with those two items omitted for that period?

A. Making that deduction and dividing by 2,292,035 thousands I obtain if I done it accurately 63.31 cents per thousand cubic feet.

Q. Now will you deduct that from your 63.99 and tell us what the difference in the average the deduction of those two items would make?

A. The difference between 63.99 and 63.31 is .68.

Q. .68 of a cent?

A. Of a cent.

2365 Q. Then that would be the difference in the average operating cost for the five years if those two items were eliminated instead of something over three cents?

A. Not if applied to one year. Correct if applied to five years as shown on page 84 of my report Exhibit 23.

COURT: What amount did you divide by 2,219,000?

A. Referring to page 84 of my report?

COURT: No, right there.

A. $1,466,821.22 less $15,602 gives me $1,451,219.22. That operation is practically a duplicate of my report, page 84.

Q. Now asking the question over again and I hope for a direct answer the difference in the average operating costs for these five years that would be made by deducting these items amounting to $15,602 is .68 of a cent per thousand, is it not?

Objected to for the reason that the question has already been answered and for the further reason that the question assumes that the witness has not given a correct answer to the former question.

A. Yes, sir.

Q. I notice Professor that on the outside of this report of yours that is marked Defendants' exhibit 23, you are referred to as Ph. B. C. E., consulting engineer and statistician. Was the word statistician put in there without your acquiescence or consent?

A. No.

Q. Then what did you mean by telling us this morning that you were not a statis-cian?

A. I told you I had not qualified as a statis-cian.

Q. And that you did not remember having ever qualified as a statis-cian.

A. I don't recall having qualified as a statis-cian. It is too indefinite.

2366 Q. What is?

A. The statis-cian part.

Q. Now passing that for a minute who made this blue print commencing your report?

A. The United Gas Improvement Company made the original drawing.

Q. Who copied it?

A. One of my assistants.

Q. How old is it?

A. Oh it is quite old. I don't know exactly, it was merely to elucidate the general appearance for the benefit of the Master.

Q. What is the size of the generator that is shown here?

A. Not stated.

Q. I know, but don't you know?

A. I do not.

Q. What did you do, take something you found in an advertisement and ask one of your assistants to copy it or trace it?

A. Yes, to trace it, never looked at it again.

Q. All you did was to put your name here William D. Marks, C. E.

A. Yes, sir.

Q. Now in your direct examination when you were called in the Consolidated case entitled William R. Wilcox and others, against

the Consolidated Gas Co. of New York, or the reverse, was this the first question asked you and is this your answer? "Q. You may tell us something about yourself, what your profession is. Ans. I am a consulting engineer and statis-cian, making a specialty of gas and electricity, I have had a good deal of experience more particularly in the direction of statistics of gas. I have attended all of the meetings in this hearing and also before the State Gas and Electricity Commission and listened to the testimony. I have spent a good deal of time in careful study of the reports of the
2367 legislative committee of the state of New York 1885 and '86 and report of the Stevens Commission in 1905"?

A. Yes, sir. I did not attach special importance——

Q. I did not ask you that, simply asked you if that is the question put to you?

A. I do not recall, I think though that is substantially correct as reported there.

Q. Now does this blue print returning to that, show correctly one of these machines as it is arranged today?

A. No, it only illustrates the general principle as the United Gas Improvement Co. tried to show it.

Q. What are the differences between this machine as shown in this blue print and say the ten foot six set over in the plant there?

A. I have not looked at that closely enough knowing it to be an advertisement.

Q. Will you kindly look at it and tell us?

A. In what way do you desire to have me differentiate?

Q. I am not an expert, I wish you would tell us the essential differences in your mind as a gas expert between the machines shown by this drawing and the ten foot six set over at the works.

A. Except in the matter of detail there is no essential difference.

Q. Take it in the drawing where do they begin the process of manufacture?

A. Well usually where you put the coke in. On top of the generator.

Q. Where do you begin unusually?

A. I don't know.

Q. Then what do you mean, this is a pleasantry?

A. No, not a pleasantry, that is the way I noticed them doing here.

Q. They always begin there don't they?

2368 A. Yes, sir.

Q. That is at the left hand side as we look at this?

A. Yes, sir.

Q. Now is the apparatus set up here in the diagram in the order in which it appears over there?

A. That I don't know.

Q. Is it set up here in the order in which it is usually set up and used?

A. Yes, sir.

Q. You are certain about that?

A. Oh yes.

Q. Do they ordinarily run the gas through the condenser before it goes to the scrubber?

A. No.

Q. This shows the condenser before the scrubber don't it?

A. I see it is here now. It was a drawing I told you made by my assistant, I paid no attention to it.

Q. That is wrong isn't it?

A. Not necessarily no. If you have a multitubular condenser.

Q. What is the function of a condenser?

A. A condenser is to condense to *coll* the gas.

Q. Is that done before you put the gas through the scrubber?

A. It is generally done before in the case of coal gas.

Q. Well how about water gas, this is not a coal gas apparatus is it?

A. No, this is a water gas apparatus. I don't know how you do it, I don't know — which you put it.

Q. How is it usually done in a water gas apparatus?

A. If I used my way I would always condense before putting it through the scrubber.

Q. I didn't ask you that, I asked you how it was ordinarily done?

A. I told you I didn't know how you did it.

2369 Q. I asked you how it was usually done in a water gas apparatus ?

A. I am not connected with the U. G. I. in any way and they are the only people that do it, I can't tell you what they usually do.

Q. Do you mean to say you don't know how that is done with water gas?

A. By the U. G. I., I don't.

Q. I asked you how it was usually done in the operation of a water gas apparatus?

A. If you want to know how I would do it, I would use the condenser first.

COURT: He asked you if you knew how it was usually done?

A. I don't know how it is usually done if you put it that way, by the United Gas Improvement Co.

Q. I didn't ask you that. I want to know if you know how it is usually done leaving the United Gas Improvement Company out of consideration?

A. As the U. G. I. is the only one organization practically that is practically all I have to say about the matter.

Q. I would like to have an answer to the question.

A. My answer to that is it is impossible because *because* the U. G. I. control most all there is.

Q. That is not my question. My question is whether usually in the operation of these machines gas goes through the condenser before it goes through the scrubber?

A. In the case of coal gas, yes always.

Q. Do they make coal gas with these machines?

A. No.

Q. Then read the question to the witness?

A. I have answered yo-r question as far as it is possible to answer.

COURT: If you answer the questions promptly we will get along better and faster.

2370 A. It is this way, the U. G. I. are the only people that make these and I said I don't know how they arrange that scrubber and condenser therefore when I say that I have covered the question as far as I am able.

COURT: If you don't know what theu usually do then just say so.

Mr. BYERS: I submit he has said that twice.

A. I can't answer you any more than I have answered you, it is out of the question.

Q. Now what proportion of gas in this country is made by water gas apparatus?

A. I don't know.

Q. Is it about 75 per cent of the gas used in this country made with water gas apparatus?

A. I don't know.

Q. You would not say that was wrong?

A. I simply say I don't know.

Q. As a gas expert you don't know under these circumstances whether it is usual to run gas first through a condenser or first through the scrubber with this water gas apparatus?

A. I have already stated that I don't know what the United Gas Improvement Company does it as much as I can say. I have also added to that that I would myself use the condenser first. That is as much as I can say with regard to that multitubular.

Q. Is the United Gas Improvement Company the only concern in the United States that manufactures Water gas apparatus and sells it on the market?

A. The only noticeable concern that manufactures.

Q. Who else manufactures and sells it?

A. There is a firm in Toronto, Canada.

2371 Q. I asked about the United States?

A. That is about the only one I know of.

Q. How about the Western Gas Construction Co. of Ft. Wayne?

A. I have read their advertisements, I have never seen any of their apparatus.

Q. How long have they been in the business of manufacturing this water gas apparatus?

A. I don't know.

Q. How about the Gas Machinery of Cleveland, do they manufacture and sell this water gas apparatus?

A. I never have seen any of their apparatus, I have seen their advertisements.

Q. Do you know whether they manufacture and sell it, that is what I am asking you?

A. All I know if that they advertise.

Q. That they manufacture and sell it. Does the gas engineer Co. of Trenton, N. J., advertise gas apparatus of this kibd?

A. The first I ever heard of this concern.

Q. Does the American Construction Co. of Newton, Iowa, manufacture and sell such apparatus ?

A. The first time I ever heard of the concern.

Q. Now can you tell us any gas plant in the United States using water gas apparatus which follows what you say you would do and pass the gas through the condenser before it goes through the scrubber?

A. I never have looked into it.

Q. You said I believe that you went to St. Louis in 1871?

A. In 1872.

Q. You were there how long?

A. Fifteen to eighteen months.

Q. You did not design that plant?

2372 A. William Farmer did so.

Q. You kept the books for the construction company?

A. For the contractors.

Q. That were constructing the plant?

A. Were building the plant.

Q. And you also inspected the work to see that Mr. Farmer's designs were carried out?

A. I followed every contract as to the materials and the correctness with the drawings that Mr. Farmer furnished.

Q. So that your business there was to keep the books and act as sort of an inspector?

A. I should think that was about it.

Q. Now when did you next have something to do with the construction of a gas plant?

A. Do you mean to say with the design or with the looking after fixing up?

Q. Either one.

A. It must have been about 1900.

Q. About thirty years?

A. Just about 1900.

Q. And what plant was that?

A. That was a small plant at Fostoria, Ohio, that was partly completed. I was sent out to get it to going. Part coal and part water gas.

Q. That plant had been designed by somebody else as I understand?

A. The United Gas Improvement Company as far as the gas was concerned.

Q. Now far had the work of constructing the gas plant and laying mains progressed when you went there?

A. The water gas plant was partially completed and had been in operation. The coal gas plant the benches had to be rebuilt.

2373 Q. Then the water gas apparatus had been installed and the coal gas benches had been built but the coal gas benches you rebuilt?

A. Yes, sir.

Q. Now how much had been done in the way of laying mains when you went there?

A. A good many of the mains, I think almost all of them were completed at that time. It is a small job, I think some more work was done. I know I recall opening—going to ditcher there that were open and opening ditches. It was in the hands of a local boss who knew everybody and everything and he did most of the location.

Q. What was the total number of miles of mains in this plant?

A. It was not much, not many. I have not the faintest recollection.

Q. Let's see if I can refresh your recollection, wasn't it about eight.

A. It certainly was not more than eight or ten miles, I know it was a small place.

Q. Most of the mains had been laid prior to your going there?

A. They were finishing up the job when I got there in all directions.

Q. They were making gas when you got there.

A. Yes, sir.

Q. Selling gas?

A. Yes, sir.

Q. How long did you stay on that job?

A. Off and on I should say about a year getting it to going and arranging operations there.

Q. How much of your time did you spend there?

A. A year. I should think about half my time. I had three or four other things to look after.

Q. It took about six months to get this plant with about — miles of main going after they had commenced making gas?

A. Oh no, it was going when I got there.

2374 Q. I am just quoting your language, you said to get it going and straighten things out that took about a year.

A. No, it was not the gas plant altogether. There was an electric plant. They had consolidated the electric plant with it and the street arc lighting system the lamps had to be all fixed over beginning the street arc lighting system, I think took the bulk of my attention.

Q. So you paid comparatively little attention then to the gas plant there.

A. Well I had to pay most attention to the electric I suppose. I remember they told me to divide the expense half and half between the electric and the gas so I suppose they believed I did about half of each.

Q. Now what additional experience have you had in connection with the construction or designing of gas plants?

A. The next thing that came up was the Durham North Carolina gas plant.

Q. When was that?

A. That was along I think in 1903 or '4, I don't recollect which. I know it was just before I went to New York. That was a town of about 22,000 inhabitants.

Q. How many white inhabitants

A. I think we figured there was about 7,000 niggers there, I don't know, out of 22,000.

Q. How many miles of mains were there there?

A. I have not any recollection of that. I recall at the outset making a requisition for about five or six miles of mains.

Q. About twelve miles altogether weren't there?

A. Not at the start.

Q. I didn't say at the start, altogether about twelve miles
2375 of *of* mains in that system.

A. Now.

Q. No, when you built it?

A. I don't think so, I don't think it could be that much.

Q. How high did it go?

A. I told you about five or six miles.

Q. Aside from your experience in St. Louis and Fostoria and Durham you have mentioned, have you had any experience in the construction of a gas plant?

A. You mean as engineer?

Q. Yes, or any other way what have you had to do with building a gas plant, I don't care whether it is as engineer or as contractor or as laborer.

A. I have had no experience in the actual building of anything more that these three plants, but in the estimating for others I have had a great deal of experience.

Mr. GUERNSEY: I move to strike out the last part of the answer, I didn't ask the witness for that.

Q. Now what experience have you had in designing gas plants other than with reference to the three plants that have been referred to during the entire forty years?

A. I have originated none whatever.

Q. Did you design the plant at St. Louis, you did not I understand?

A. I said I had originated none whatever.

Q. You did not even design the plant at Durham?

A. Yes, but it was a little bit of a coal gas plant and no engineer that regards a matter of any great importance.

Q. Now aside from your experience in Ohio, that was at Fostoria wasn't it?

A. Yes, sir.

2376 Q. Did you ever operate a gas plant after you left St. Louis or have anything to do with its operation?

A. Except at Durham. I never have stayed at a gas plant any longer than to complete its building and get it into operation. I have always been—I would not stay at any plant after built and going.

Q. The thing I want to get at is what you actually did, not what you would have done. So as a matter of fact you have had practically no experience in designing constructing or operating gas plants?

A. I should deny that entirely.

Q. Do you say you have had a broad experience in designing, constructing or operating gas plants?

A. No, I should not call it broad experience in the actual creation of plants.

Q. In what line wi-ther designing, construction or operating gas plants has your experience been broad?

A. More in estimating.

Q. I didn't ask you that.

A. Yes, that is part of desiigning of a plant always and I have been used for years beginning in 1876 on that particular point in connection with gas works by men largely engaged in the operation of the old fashioned coal gas works.

Q. Who were they?

A. The principal man, that is the one who put most money in was Seymour L. Husted of Brooklyn, Henry Atrell of Baltimore, Suter & Company of New York, Arthur W. Benson, President of the Brooklyn Gas Light Company and a number of others who I never came in contact with whose money they had to handle.

Q. When was the last year you did anything for any of these people?

2377 A. In 1887.

Q. Twenty four years ago?

A. Yes, sir.

Q. At that time how far had the actual operation of water gas plants been developed?

A. It was just beginning.

Q. Have you had any experience whatever in the operation of water gas plants personally?

A. At the beginning of the water gas business.

Q. I asked about experience in the operation of plants.

A. Yes, sir.

Q. Where was the plant located?

A. The first plant was Prof. Lowe's plant the originator of this business at Manayunk, outside of Philadelphia, his experimental plant.

Q. How many miles of main did they have there?

A. None whatever that I know of. It was his experimental plant set up for the purpose of introducing the water gas process.

Q. Now then what plants in actual operation have you ever been connected with, water gas plants, I don't mean simply experimental stations but plants that were actually operating.

A. I told you one in Fostoria during operation.

Q. How much did it cost you per thousand to make gas there?

A. If I remember rightly the best they could do was 65 cents in very large quantities although they had agreed to sell it at 50 cents.

Q. This is water gas or coal gas?

A. Water gas.

Q. What did they pay for oil then?

A. About 4 cents if I remember rightly. That was gas

2378 oil you know a distillate.

COURT: Natural oil as produced right there?

A. They were not allowed to use the natural oil.

COURT: It is produced there?

A. It is produced right around there but they were not allowed to use the natural oil, the cheap oil, they had to use a distillate.

Q. Do you know why it was they used this distillate at that time?

A. Because the oil well people didn't dare to sell them natural oil.

Q. As a matter of fact the reason was, wasn't it that the apparatus at that time was not adapted to the use of the crude oil?

A. It could use crude oil.

Q. Where was it used in the apparatus at that time?

A. In the carburetter.

Q. At what place, what city or what gas works?

A. They were using it at a little town just east of them.

Q. What is the name of the town?

A. I forgot the name of the town.

Q. Anywhere else as far as you know?

A. I didn't look for it anywhere else.

Q. I didn't ask you that.

A. I don't know.

Q. You don't know of any other place?

A. No.

Q. Are you an expert in the manufacture of water gas?

A. Do you mean by that have I practical- personally operated?

Q. No you have said you had not, but I want to know whether you know how to operate and can operate a works.

A. I had to operate them for many days in Fostoria, Ohio.

Q. I didn't ask you that.

A. I do.

Q. Are you now competent to take hold of and operate
2379 a water gas plant?

A. That is a very broad question, I should feel perfectly competent with a little indulgence for what possibly might be awkwardness the first week or two.

Q. Now then what temperatures do you use in your generators?

A. You judge of those by the eye.

Q. I didn't ask you that*m* what temperatures do you use?

A. Oh I could not give them to you.

Q. Between what extreme may the temperature vary for efficient results?

A. Well as near as I could tell you by sighting through the sight hole it would have to be a white almost liquid looking heat that is acquired in the disassociation of steam in contact with incandescent carbon.

Q. I didn't ask you that. I asked you between what limits of temperature in the generator may vary and still give you efficient results in manufacturing?

A. That has all been worked out, I can't recall it at the present moment. The data is all given in most of the——

Q. I know, but do you know yourself?

A. I have not sufficient memory to recall these things.

Q. At what pressure do you put blast into a ten foot six generator what is the air pressure there?

A. Be very difficult to say, you would have to put it in until you got the result of getting the gas through and that is a thing you could see. Depend on the depth of your fire.

Q. Do you know what limits the pressure varies in actual operation?

A. I don't know now, I can't recall.

Q. Did you ever know?

A. Yes, sir.

Q. Read it in a book somewhere?

2380 A. No, had to hunt it up by actual practice.

Q. That was how long ago?

A. A long time ago, I should say eight or ten years ago.

Q. What is the difference between the pressure you used with your blast in an eight foot six set and a ten foot six set?

A. The largest set I ever operated was I think a six or six and a half foot set and I don't even recall what the pressure was there. Although we had it on the g*uage* and marked with a string.

Q. What steps would you take if you were operating one of these sets to determine whether the pressure was too high or too low or right?

A. I would ask the United Gas Improvement Co. to send one of their regular operators, a man probably of no scientific acquirement at all but used and accustomed to handling these various plants and wit*n* it their instructions how to do this, just what every one of them does when they start a plant up, rely on the guarantee of the United Gas Improvement Co.

Q. You would not rely on your own knowledge as a nexpert in the business?

A. That is out of the question.

Q. Now then did you ever buy a water gas set?

A. Personally?

Q. I don't mean for your own use, but did you ever make a purchase of any for anybody?

A. I settled for a purchase which was made by other parties in Fostoria, Ohio.

Q. That is your o*b*ly experience along that line?

A. The only time I ever had any cash dealings with the United Gas Improvement Co.

Q. Have you bought any cast iron pipe for gas mains

2381 within the last ten years.

A. Yes, I bought a lot at Durham, North Carolina.

Q. That is where you had about five miles?

A. Five or six or seven.

Q. That is all you ever bought in your life isn't it as far as you can remember?

A. No, I had a great deal to do with the contracts that were made in St. Louis and there was a very large amount went in there if I remember rightly. That is a long time back.

Q. Did you negotiate these contracts?

A. That would be very difficult to say because the whole matter was put through me as a resident there and decided finally by the

contractors in conclave. The average man would tell you he did it all. I will tell you frankly what I did was to get everything going and they finally made up thrit minds what they would do and told me to go and do it.

Q. Have you laid any gas mains since you were at Durham?

A. Not that I can recall.

Q. Have you bought any meters since you were in Durham?

A. No.

Q. Have you bought any gas apparatus of any kind since you were in Durham?

A. I have not.

Q. Do you remember definitely when it was you were in Durham, when you finished there?

A. I could not tell without referring to papers but I know it has been since 1900.

Q. Now you said you were employed in the Wilcox case in New York as technical expert in gas matters more particularly appraising and accounts so far as operating expenses were concerned.

2382 Did you make an appraisement in the Wilcox case of the property of the company?

A. Yes, sir.

Q. Did you testify in the Wilcox case you were not permitted by the company to examine its property?

A. Yes, sir.

Q. That was correct of course.

A. Yes, sir.

Q. Did you ever examine its property?

A. Yes, sir.

Q. Without the company's permission then?

A. By special order of the court.

Q. Now then was an inventory made of that property?

A. I was the only one that made a written inventory.

Q. Was there a detailed inventory made of that property?

A. The company stated——

Q. I didn't ask you that.

A. Yes. I was the only one that made a detailed inventory.

Q. You did make a detailed inventory?

A. Yes, sir.

Q. Have you a copy of that inventory?

A. Yes, sir.

Q. Will you let us see it?

A. I have it among my papers at the hotel, I will be glad to bring it around.

Q. In that did you take the property up item by item to get at either its original cost or the cost to reproduce it in that valuation?

A. I endeavored to do so.

Q. And made a report at that time?

2383 A. Made a report at that time.

Q. You have a copy of that I suppose with you?

A. Yes, sir.

Q. You will let us see that?

A. Yes, sir.

Q. Now then in Buffalo you said you were called upon to appraise the gas works. Was there an inventory taken there?

A. By myself, yes.

Q. How much time did you put in in Buffalo in making this appraisement, in making the inventory?

A. Something in the neighborhood I think of two months.

Q. About two months?

A. Yes, I can't recall that, I would like to leave that open if you would like to have it exactly.

Q. Was there a detailed inventory made there such as has been made here either by you or anybody else?

A. You mean before I got there?

Q. No, in connection with that hearing.

A. I don't recall anybody else making a detailed inventory except myself.

Q. Was that inventory introduced in evidence?

A. I think not. It was used merely as far as results was concerned.

Q. It was not produced on the trial was it?

A. I think not.

Q. And there was no testimony there as to any detailed valuation of buildings and things of that kind?

A. Yes, there was considerable testimony.

Q. As to details there?

A. As to details of buildings.

2384 Q. Now in Jersey City did you make an inventory, you say "-was called upon to appraise gas works there"? Did you make an inventory there?

A. There I made an appraisal for the purpose of taxation, going *arou* around and getting the various buildings, locating them and using the standard units of quantity and working it out in that way, but not going into details as for instance I have *g*one here.

Q. Was there an inventory made there?

A. You mean by me?

Q. Anybody?

A. Well of course I can't tell outside of myself.

Q. Was there one made to your knowledge?

A. I saw nothing of the sort.

Q. How long were you appraising this plant at Jersey City?

A. I spent about three or four days.

Q. And what was the size of the plant, how many miles of mains or what was the capacity?

A. I could not reco-lect that, I can dig it up if you like. It was up in the hundreds of miles.

Q. A larger plant than this one here?

A. Even that I can't recall on the spur of the moment I should think it was considerably larger.

Q. So it would have been impossible to have made a detailed inventory in three or four days?

A. Yes, sir.

Q. Now in the Buffalo case that was a hearing before a commission wasn't it?

A. Before the old and extinct gas commission of the state of New York.

Q. You appeared for the city?

2385 A. Yes, sir.

Q. The New Jersey case was a hearing before the Tax Commission?

A. Yes, sir.

Q. There was a question as to valuation of the plant for purposes of taxation?

A. Yes, sir.

Q. Also appeared for the city?

A. For the Mayor of the city. He had a German name, I have forgotten that too.

Q. Now you say an appraisement was made in Cleveland?

A. Yes, sir.

Q. Was that a detailed appraisement such as has been made here, was there an inventory such as here?

A. A much more detailed appraisement so far as I was concerned than I found it necessary to make here.

Q. That don't answer my question exactly. Was there an inventory prepared in detail showing the plant as prepared here?

A. Not only an inventory such — we have here, but complete drawings of the plant and all plans were made by myself and my assistant.

Q. You made the inventory there?

A. Yes, sir.

Q. Was it as complete as the inventory we have here?

A. So far as drawings are concerned it was much more complete.

Q. Then you don't criticize this inventory as too complete?

A. I admire it very much for its extraordinary completeness.

Q. Then this Bronx case, gas and electric works, was there a detailed appraisement made there?

A. If I remember rightly there was a d-tailed appraisement given in the form of evidence before the street opening board, I don't know whether that is the proper name for it or not, but at

2386 any rate it was the men who had the right to assess damages resulting from opening streets through property and I gave a detailed estimate there, the time occupied, if I remember rightly was a couple of months or more.

Q. There you also appeared for the city?

A. For the corporation counsel. It is difficult to say who I was appearing for.

Q. Who do you mean by corporation counsel?

A. Of the City of New York.

Q. In Cleveland did you appear for the city?

A. For the gas committee of the city council.

Q. Now in Minneapolis, was there a detailed appraisement made?

A. There was not.

Q. There you appeared for the city?

A. There I appeared for the city council.

Q. Does that cover the appraisals that you referred to on your direct examination?

A. Let's see, New York 11, Buffalo 4, Cleveland 3, Jersey City—yes I may have forgotten some, but I think that is all.

Q. There is one thing I want to get straightened out about your report Complainant's Exhibit 23, is that supposed to show the reproduction cost of the plant or not?

A. No.

Q. Is it supposed to show the original cost of the plant?

A. It is supposed to show——

Q. No please answer my question is it supposed to show the original cost of the plant?

A. Kindly before I answer that question explain to me what you mean by the original.

Q. The dollars actually spent in the plant.

A. The real money put into the plant, is that it?

2387 Q. Whether it was real or counterfeit, whatever was put in?

A. Yes, sir.

Q. Then it is not intended to show the value of the plant at this time is it?

A. At what time?

Q. This time.

A. Today?

Q. Yes.

A. Only in so far as the cost of the materials and labor correspond with the cost of materials and labor used in gas works at the time in which these structures were put in.

Q. You recognize a difference between cost and value do you not?

A. Very decidedly.

Q. And your report is intended to show the original cost of this plant?

A. Yes, sir. You forget and also the present value.

Q. How did you arrive at the present value in your report?

A. By a process of residual depreciation.

Q. Can you say it short, by deducting from what you call original cost what you estimate to be the depreciation?

A. The residual depreciation.

Q. So your definition of value is original cost less what you have termed residual depreciation?

A. Yes, sir.

Q. And so is that the sense in which you use the word value in your report and in your testimony?

A. The present value I mean by that. May I make a correction. Referring to the $147 on the bottom of page 14 it was a typographical error. It has no meaning whatever, was not used at all or referred to again. The whole matter touched upon here was

2388 treated by an entirely different method and is finally, *is* shown on page 80 under the head of residual depreciation for one year, computed for one year, life of works forty years.

COURT: I simply asked you that so I would understand the way

you had figured. It is perfectly evident to my mind that $147 was a mistake. By the bye, if I understand you, you allowed two per cent or figured two per cent as to depreciation of buildings and works both, is that correct?

A. On page 80.

COURT: No, generally is that true or not?

A. That is approximately true. In depreciation of these buildings I used something that I learned in Cleveland for the first time, the Summers' system of depreciation.

COURT: All I want to know is your rate.

A. The rate in the Summers' system, the depreciation, the rate per year grows less as the building grows older. It is not a uniform two per cent rate. This Summer's system is adopted in Cleveland and also in part in New York City and a great many other citiehave taken it up.

Q. Now the first thing that was called to your attention seems to be this matter of the quantity of brick. Of course these quantities, Professor, were something that any engineer with any experience could figure from the plans were they not?

A. If you will change that word to knowledge I will say yes.

Q. And the number of brick that is ordinarily taken for purposes of estimates in a cubic foot or in a square foot is a matter of common knowledge among engineers isn't it?

A. For estimates it is a matter of you might say common custom.

Q. So that there was nothing in the statements in the inventory assuming that they were erroneous that could have misled a
2389 competent man.

A. They are very misleading.

Q. That is a competent man accustomed to making estimates on brick work would be misled by the erroneous statement as to the number of brick per cubic foot for instance?

A. Unless very careful.

Q. He would not know how many brick ought to be figured per cubic foot if he was accustomed to making estimates?

A. For estimates I have stated the figures used are customary. But I wish to emphasize the wor- "estimates."

Q. And what are estimates.

A. The preliminary computations before a building comes into existence while it is not yet a concrete fact and exists only in the imagination of the engineer who is designing it.

Q. So that if a person were estimating what it would cost to reproduce this plant, to build an imaginary hypothetical plant, these figures would be proper figures to use wouldn't they?

A. To provide ample margin, yes.

Q. Now then what figures did you take?

A. The figures based on the actual facts.

Q. Now what provision did you make for brick that would be broken in hauling and things like that?

A. The grade of this work is such that it could all be used.

Q. So that you assumed that there would be no waste whatever in the brick that would *would* measure up the wall and pay for simply the brick that were in the wall and have no waste and no excess.

A. I assumed it being a fact that there are sixteen brick as shown by the first exhibit which I made in a cubic foot that if I take 18 *foot* to a cubic foot or seventeen and a half brick to a cubic foot that I was making an allowance of from one and a half to two
2390 bricks throughout the brick work for the purpose of taking care of just such matters as you could not very well avoid and also I have known a bricklayer in that sort of work to be reported to put in three thousand bricks, spalls and bats in one day.

Q. I know you told us that this morning, I didn't ask you about it, you testified to that on your direct this morning. Who built this exhibit for you out of these brick?

A. An unknown gentleman residing in Des Moines, a bricklayer, I don't know his name.

Q. Did you employ him?

A. I did not.

Q. Who did?

A. I think Mr. Dobson.

Q. Who is Mr. Dobson?

A. Mr. Dobson is ex-city engineer of the city of Des Moines and has very kindly assisted with such information and assistance as he could give.

Q. Has he been employed by you or the city in this matter?

A. I don't know, but I think he is in the city's pay now. I know that he has been city engineer.

Q. He is one of the people to whom you went for information you said I believe as to some of your unit prices.

A. Yes, sir.

Q. Now to get this a little more in the concrete, I want to turn to one of these buildings. We will take the first one, I see quite a radical difference between you and our people and I would like to find out where it is?

A. What page please?

Q. Page 18 of the inventory. Now what did you allow for the excavations there?

A. 189 cubic yards at 35 cents.

2391 Q. What did you allow for clearing site and staking out?

A. Nothing.

Q. Now then the foundation there is concrete I believe?

A. So stated.

Q. Well did you estimate it on that theory?

A. Yes, sir.

Q. What misture.

A. One, three, five. When I say 1-3-5 I mean one barrel of cement, three barrels of sand and five barrels of broken stone about two to two and a half inches in its largest dimensions.

Q. What price did you take for cement?

A. I don't recall what I took the cement at, I estimated it at $7.00 a cubic yard in place.

Q. How did you get $7.00?

A. By taking cement and stone and sand and working it up and the labor.

Q. What is cement worth here?

A. I don't recall that for the simple reason I relied on Mr. Dodson's statement at the time and with the interminable mass of figures I have had I can't recall every one of a thousand details.

Q. What is cement worth in Buffalo?

A. I could not hazard a guess now. I can get a paper at any time to tell me.

Q. I want to know if you had any knowledge except what anybody might have acquired?

A. No.

Q. Do you know anything about what cement has been selling for in Des Moines the last year or two?

A. I did know a week or two ago, but I have thoroughly
2392 forgotten it among the mass of materials I have been working on since.

Q. Have you the figures from which you figured out the $7.00?

A. I have figures somewhere but would have to dig it up again.

Q. Haven't you the book in which you make estimates?

A. Right here is the book and I say I estimated $7.00.

Q. What you have there is a copy of the inventory?

A. No, the inventory don't say $7.00.

Q. What you have before you there purports to be a copy of Exhibit 15 with some of your figures put on it?

A. It is.

Q. Where did you do your figuring by which you got your $7.00?

A. I did my figuring on a stray bit of paper in consultation with Mr. Dobson as to the cost of cement and stone and sand and I will do it again if you will give me time to hunt up the prices if you like?

Q. I would rather rely on what you know than what somebody else tells you. So you haven't kept the figures on which you based the computation?

A. The $7.00, no.

Q. Can you tell us what you put broken stone at?

A. No. As I say I will have *yo* work it up again if you want it.

Q. Can you tell us what you put sand at?

A. Have to work that up again.

Q. Can you tell us what you put labor at?

A. Have to work the whole thing up.

Q. Do you know whether you made an allowance for tools or not?

A. Made an allowance for everything.

Q. Do you know whether you made an allowance for tools or not?

A. Yes, sir.

Q. How much?

2393 A. I don't recollect.

Q. Can you tell us what would be a reasonable allowance for tools?

A. I can't now.

Q. Can you tell us what is a reasonable allowance for labor?

A. I can't now. I will work it up for you.

Q. Can you tell us what would be a reasonable allowance for stone per cubic yard, I mean?

A. I can't now.

Q. Can you tell what would be a reasonable allowance for any item going into a cubic yard of concrete in this foundation in place?

A. I can't at this moment.

Q. Did you get all your information about this subject from Mr. Dobson one of the city's engineers?

A. As to prices, yes.

Q. How much did you make that foundation at $7.00 a yard?

A. $266 at $7.00.

Q. Now then what did you put in for forms?

A. That $7.00 included forms.

Q. How much did you allow for forms?

A. I can't tell you now. I will get you the whole figure.

Q. I don't care for the figures unless I can have the originals. What is an ordinary allowance for forms per cubic yard for concrete work in Des Moines?

A. Depends on the size and volume of the concrete work in contemplation.

Q. Take foundations. What is the proper allowance?

A. Even that would be a guess.

Q. What would be the proper allowance in the case of this building?

A. I will have to go into details on that again by hunting up my papers, I have the allowance.

2394 Q. What is the maximum amount that would be a proper allowance for forms for concrete work in a foundation in Des Moines?

A. Oh you are going into—you are verging on the infinite a question like that, because there is an infinite variety and detail of conditions in which forms might be used. It is quite possible that they would drop and I am quite sure I would drop rough concrete in a foundation into a ditch with a few loose boards along side and sticks simply to hold it in place until it set. The work and the value of what is called the forms or moulds here would be next to nothing for these boards could be used again and again pulled out and it is done that way all the time.

Q. Is that as close as you can come to an answer to the question?

A. At present unless you will specify.

Q. Take ordinary foundation work where you have excavated for a cellar how much would you allow per cubic yard for forms for concrete foundation?

A. You mean for forms for what, for the walls?

Q. Forms for the concrete foundation under those circumstances

A. Do you mean a foundation that just comes—take this build-
